It is commonly said, with reference to female beauty, that each nation has its own standard, and each individual his own taste; and yet no one expresses surprise when it is found that all nations and all individuals concur in declaring a particular figure, executed in marble, to be perfection itself. That there is an error here is obvious, for there cannot be a universal type and national types of the same thing at the same time; and in our opinion it arises simply from our confounding passion with taste, and giving the sacred name of beauty to that which is merely loveliness, or the quality which excites affection.* The mistake has been productive of much waste of thought and time; for it has led various inquirers of the most elegant and ingenious minds to confine their researches within such limits as sex, age, and association of ideas; and the practical result is, that we have no such thing as an intelligible definition of beauty, writers even of the highest rank being fain to content themselves with telling the world not *what* it is, but *where*, in their opinion, it resides.

If we emancipate ourselves from these restrictions, and look upon beauty as identical with a principle pervading all nature, as obvious in her minutest works—in a leaf, or flower, or in the crystals of an evaporated tear or of a flake of snow—as in the human face divine, we shall find our explorations much easier. In music we have national melodies in many cases as unintelligible to the hearts of other nations as the language of the people. These are to classical melody what loveliness is to beauty, depending for their charm upon local constitution and associations: and we do not in their case attempt to construct a science out of partial and peculiar facts, but admit that the ear of taste may linger delightedly over such untaught combinations, even after being elevated into a devout appreciation of the works of the acknowledged masters of song. Precisely in the same way a woman of our own country may be charming in our eyes, with all her national peculiarities of face and form; while at that very moment our educated taste may be thrilled with admiration of the ideal beauty of the old sculptors. To comprehend and acknowledge this distinction between taste and passion—between the partial and mutable and the unchanging and universal—we consider to be indis-

* Journal, No. 330; article 'Ideal Beauty.'

pensable in any philosophical inquiry into the nature of beauty.

But is it not extraordinary, even with reference to human beauty, that in spite of national peculiarities, and in spite of the whims and fantasies of passion, there should exist a type which all civilised men unite in acknowledging? Is it not extraordinary that this type, not belonging, in absolute integrity, to any one nation, or any living being, should have been discovered by a single people, the ethereal idea resolved by them into solid marble, and the idolum of beauty thus set up for the worship and despair of succeeding ages? The genius of the Greek sculptors might have taught them to personify sentiment and passion, but it could not have taught them to deify form. The sentiment and passion are modified, as might be expected, by numerous circumstances, and by none more than individual skill; but the form is identical throughout an entire people, and through hundreds of years. That form does not belong to life, but it belongs to nature; and it may be presumed to foreshew the attainment of her aim, the completion of her development, the fulfilment of a law of progress which is at work in her whole domain.

But how did the Greeks of the age of Pericles attain to a knowledge of that which is not yet born, yet which we of the present age consent, as implicitly as they, to accept as the true beauty? This question has not, till recently, received so much attention as it deserves; the Greek sculptures, and the other productions of that people in the formative art, being merely used as examples of surpassing beauty, and their peculiar skill set down vaguely as the result of peculiar genius. This might be said with sufficient probability, as we observed on a former occasion, of the genius of an individual; but when we see the same result arrived at by several generations of a whole people divided into separate states, and united by little more than a common language, and when we find the skill inferred vanish completely and for ever during the convulsions of the country incidental to its being absorbed into the Roman dominion, we are forced to look for some other cause. The same system of proportion, as Winckelmann observes, is found even in ordinary figures by the ancient artists; and notwithstanding differences in execution, all the old works appear to have been executed by followers of one and the same school. It would seem, in fact, that during the palmy period referred to, certain *principles of art* must have been known, which, like many other secrets of antiquity, were subsequently lost.

It has always been suspected that the ancient sculptors were acquainted with some definite laws of proportion, which gave a vantage-ground to their genius far more important than can be acquired in our day by the most laborious study. The evidences of the fact may be found in Müller's 'Ancient Art and its Remains'; but for our part we are more inclined to trust to logical deductions than to the little we know or comprehend of the doctrines of Pythagoras or Plato. The former is admitted by Dr Burney to have been the inventor of the monochord, or harmonic canon, which reduced music to a geometrical science; but neither he nor his great follower is in anywise precise in bringing under a similar law the other departments of æsthetics—by which word it seems to be now agreed that we should describe all matters pertaining to the fine arts. It may very well be argued that there was nothing to hinder the theory of the formative art, any more than that of the art of music, from being laid down by the ancients with precision; but we do not see how it is possible to get over the simple facts already mentioned, that the type of ideal or preternatural beauty left by the Greeks is accepted at this day as the true beauty wherever civilisation exists; and that the art of sculpture, as practised for several centuries by an entire

people, and which was lost with their national independence, is still the despair of the modern world.

The popular objection to a theory which proposes to place the formative art upon a geometrical basis like music, if well founded, must be so by mere chance; for in itself it is curiously illogical. This objection is, that if such a theory were correct, it would make every geometrician a Phidias. In other words, any man who executed a symmetrical figure would necessarily acquire the power of Dædalus to make it move its marble limbs; or the influence of Pygmalion, to have it warmed by the goddess of beauty into life and love! This is something like supposing, as a writer we shall come to presently remarks, that a 'scientific knowledge of the grammatical construction of language would enable men to write true poetry.' Geometry, however, although certainly a very admirable thing, can work no such miracles. The most accurate imitator, whose unwearied industry has been to him a substitute for science, and whose copies can hardly be distinguished from the originals, derives no power from that proficiency to give artistical expression to a single thought of his own. If the theory referred to be correct, it will simply put it into our power to obtain, by scientific rules, a result we at present strive after by a laborious education of the eye. And this is the more important from the fact, that many a true artist is deficient in the mechanical basis of his art. Some men acquire in months what others toil after in vain for years; and examples might be given—and these not remote either in place or time—of high and undoubted genius failing of its reward from a mere defect in that minor faculty on which proportion depends.

The same analogy between the eye and the ear (using both these words to denote the faculty that appreciates fitness and beauty) which we have traced in other circumstances, is obvious in the present case. One man has a finer eye just as he has a finer ear than another; and both organs are susceptible of education: the difference being solely this, that in music science comes to the aid of the dull ear, and elevates its possessor to the perception and execution even of classical melody; while in art the dull eye has hitherto continued to plod on without assistance, and to cloud with its 'dim suffusion' the light of genius. It is curious that, with these analogies before him, the author of the article 'Beauty,' in the *Encyclopædia Britannica* (who is likewise the author of the criticism in the *Edinburgh Review* on Alison's work on the same subject), should have forcibly disunited music and art, by asserting that the faculty of appreciating melody and harmony is 'quite unique, and unlike anything else in our constitution.'

Independently, however, of the notions caught from the dreamy hints of Plato, the analogous nature of the beauty of sight and that of sound appears to have struck inquirers of different ages; although special respect is of course due to the opinion of those who made the exact sciences their study. Newton declared his inclination to believe in some general law regulating the agreeable or unpleasant affections of *all* our senses; and, in particular, in the relation between objects of sight and the harmonic ratios in their capacity to inspire the feeling of beauty. A later essay, by F. Webb, printed in the 'Nugæ Antiquæ,' comes still nearer to the nature of a theory, and declares that where the principles of harmony can be applied to works of art, they excite the pleasing and satisfying ideas of proportion and beauty. The grand difficulty, however, was the mode of applying those principles of harmony in such a way as to test the question fully; and this discovery was reserved for our own day, and for a studious thinker not previously known in the world of science or of letters.

In a former article we introduced to our readers this

modest yet zealous inquirer, who presumes to fling over his trade of decoration the light of philosophy;* but he has now published a new, and, as he states, a last volume, on his favourite subject, which demands the careful examination of every student of æsthetics.† Mr Hay, as our readers know, had the good sense, or the happy inspiration, to go back to the principle which must have governed the theory attributed to the ancient geometricians. The monochord of Pythagoras was the foundation not merely of earthly music, but of that harmonic science in which his soaring imagination sought the law of the evolutions of the heavenly bodies; and from this simple instrument, as the measurer of beauty in sound, Mr Hay deduced his harmonic canon of the beauty of objects of sight.

The monochord is merely a string of a certain length, stretched between two bridges standing upon a graduated scale. Supposing its tension, when drawn, to be such that, if suddenly let go, its vibrations produce C, that note becomes the fundamental note or tonic; and as the vibrations go on, by their spontaneous division and subdivision the leading notes of the diatonic scale, called the harmonics, follow. Each of these notes is formed of a certain fixed number of vibrations, producing in the surrounding atmosphere a corresponding series of pulsations; and these acting upon the auditory nerve, affect the sensorium with acuteness or gravity. Suppose the fundamental note C to be produced, the string spontaneously divides itself in the middle, and the vibrations of the two parts occur with a double frequency, producing a note double in pitch. It then divides itself into three parts, vibrating with triple frequency; and so on in the arithmetical progression of 2, 3, 4, &c.; the sound, while increasing proportionably in pitch, becoming fainter and fainter as the vibrations multiply.

This may be sufficient to give a general notion of the monochord, though to the book itself we must refer for a full and intelligible explanation; and having fixed this idea in his reader's mind, Mr Hay proceeds to shew that 'the eye is capable of appreciating the exact subdivision of spaces, just as the ear is capable of appreciating the exact subdivisions of intervals of time, so that the division of space into an exact number of equal parts will æsthetically affect the mind through the medium of the eye, in the same way that the division of the time of vibration in music into an exact number of equal parts, æsthetically affects the mind through the medium of the ear.'

Proceeding from this theorem, Mr Hay constructs a figure answering to the monochord of music, and intended to comprise the harmonic ratio of forms. The figure is composed of a long vertical line, with a horizontal one at the bottom, from the farther end of which is described the quadrant of a circle, meeting the verticle line at its base. Through this quadrant the other angles are drawn, 'simply by subjecting it to the same mode of division which nature has pointed out in the production of the harmonics of sound, through the spontaneous division of the string of the monochord.' These harmonic angles correspond exactly with the diatonic scale of musical notes, and are constructed thus: the quadrant of the circle, described, as we have mentioned, from the right-angle, contains 90 degrees, and these are divided, like the diatonic scale in music, into eight parts. The fundamental angle, answering to the note produced by the whole of the monochord, is therefore a right angle of 90 degrees; the next is one-half, or an angle of 45 degrees; the next one-third, or an angle of 30 degrees; and so on,

proceeding exactly according to the natural divisions of the monochord.

The following is at least substantially a portion of the explanation of the theory read to the last meeting of the British Association by the Rev. P. Kelland, professor of mathematics in the university of Edinburgh. It would be impossible to find better or simpler words to convey the meaning:—'The involuntary education received by the eye usually enables it to form a tolerable judgment as to positions and relative magnitudes. Its estimate of the symmetry of an object is equally accurate with that formed, by a person unused to music, of the correctness or incorrectness of a note in the scale. Greater accuracy is the result of cultivation. An artist can detect errors in the proportions of a figure which will escape an uneducated eye. From these considerations, it appears that whilst the ear is learning to judge of successive sounds with the same facility with which the eye judges of successive spaces, the eye again is acquiring the power of the estimation of spaces in combination, with that extreme accuracy with which the ear estimates a combination of sounds. And it is reasonable to conclude with our author, that simplicity of proportion, which is so necessary an element to the satisfaction of the one sense, should be an essential element to the complete gratification of the other. Another position laid down by Mr Hay is, that the eye is guided in its estimate by direction rather than by distance, just as the ear is guided by number of vibrations rather than by magnitude. The architect well knows that one elevation of a simple building is more agreeable than another; but on the application of numerical ratios to its measurement, he finds them to fail altogether. Artists, from the time of Albert Durer downwards, have measured the relative proportions of the human figure; but neither architects nor artists have as yet arrived at anything beyond the most vague and unsatisfactory inferences. This has arisen from their having taken length, and not direction, as their standard of comparison—from their having endeavoured to apply simplicity of linear, not of angular proportion. A picture-frame, in which one side is half the other, is not of nearly so pleasing a shape as another in which one side is half the diagonal, or the angle which the diagonal makes with one side is half that which it makes with the other.

'The basis, then, of Mr Hay's theory is this, that a figure is pleasing to the eye in the same degree as its fundamental angles bear to each other the same proportions that the vibrations bear to one another in the common chord of music. Now in music, the simplest divisions are by 2, 4, &c. which produce tonics; the next are divisions by 3, 6, &c. which produce dominants; and so on; and the chord is pleasing in proportion to the simplicity of the numbers which represent the vibrations of its constituent notes; and the same thing is true of the fundamental angles of a figure.'

The manner in which the author applies his scale to the formation of a perfect human figure would be unintelligible without diagrams; but we may mention generally, that it is adapted to the osseous structure, and of course only when that structure is completely developed. With this exception, the system is susceptible of infinite variety. We would likewise remark—having already heard of some cavilling on the subject—that Mr Hay's diagrams of the human figure have no reference to the conditions of life: the figure may be supposed to be horizontal or oblique—or like a skeleton when measured, to be hung up by the head—as well as standing like a living man on its feet.

One curious fact is deduced from the application of this new harmonic scale—that the skeleton of the female is more harmoniously symmetrical than that of the male, inasmuch as the right angle is the fundamental angle (the tonic note, as it were) for the trunk and

* Mr Hay is a house-decorator in Edinburgh. The article alluded to is entitled the 'Science of Art,' in No. 332.

† The Geometric Beauty of the Human Figure Defined; to which is prefixed a System of Æsthetic Proportion applicable to Architecture and the other Formative Arts. By D. R. Hay, F.R.S.E. Edinburgh and London: Blackwood. 1851.

the limbs, as well as for the head and countenance; while in the male it is the fundamental angle for the head only. But the most remarkable thing to be observed of the new theory, is its consonance with the science of proportion which produced the ideal beauty of the Greek sculptors. The inference we drew in our former article from the extraordinary facial angle of these artists was, that they must have taken their features not from life, but from geometrical rule; and here in this harmonic scale we have the rule itself. To this consonance we would in a special manner draw the reader's attention; since, if fully established, it must open out a new and most interesting field for philosophical inquiry. If the beauty of form depends upon geometrical principles, like the beauty of sound, we have not only an explanation of the universal homage paid to the masterpieces of ancient art constructed on these principles, but we may conclude that such masterpieces themselves form the point to which nature is tending in her development of the physical beauty of the human race.

Another thing to be observed in connection with the law of proportion, is the sublime repose of the finest antique statues, and the general abhorrence manifested by Grecian art of those constrained attitudes which distort the limbs and destroy the soft contour of the muscles. The same thing has been remarked by Winckelmann and others, but without reference to a geometric rule which such contortions would have outraged. They probably consider it as nothing more than the spiritualised indolence of the Orientals, by whom action is represented as a momentary interruption of repose; just as

'The god who floats upon a lotus leaf
Dreams for a thousand ages; then awaking,
Creates a world, and smiling at the bubble,
Relapses into bliss.'

It is only further necessary, in hasty remarks like these, to observe that Mr Hay has not confined his measurements to the human figure, but has extended them to architecture. The portico of the Parthenon, for instance, he finds constructed on the same geometrical rule; and he believes this rule to be the discovery of a law of nature, since he detects its operation even in leaves and flowers. For our own part, we would merely caution those who may enter upon an examination of his theory, to avoid the error of supposing that its tendency is to set aside the other causes of pleasurable emotion which every man feels to be at work in his own bosom, and which it is customary to confound with the idea of beauty. We have already mentioned the rude songs which fascinate the ear even of refined taste, and the irregular features that are nothing less than divine in the eyes of love. Here there are at work associations and sympathies which govern the passion, whether as regards music or loveliness, without in anywise interfering with the taste in beauty. If the Venus de Medici, a model of the beautiful, were a hundred feet high, and placed upon a stupendous rock for a pedestal, the figure would be sublime. Such would be the effect of mere magnitude. And if clouds and mists floated round the goddess, distorting her limbs, and giving a wild mobility to her features, the sublime would remain after proportion was lost. Such would be the effect of the emotion of poetical terror, which has nothing to do with the idea of beauty.

The tendency to materialism which, notwithstanding the example of melody, will be ascribed by some to a theory which turns so ethereal a thing as beauty into a geometrical problem, has been practically refuted by the ancient sculptors. Rising from the vantage-ground of science, these masters of all time superadded to their material creations a spiritual life; while Plato, by the aid of the sister science of numbers, arrived at the

divine itself. In Mind, he finds that fountain and principle of beauty which in external charms sees only the shadow of its own affections; and this idea of a heathen philosopher throws a spiritual light upon the intimation of the inspired Hebrew, and makes us thrill and tremble with a proud fear while we read—that GOD CREATED MAN IN HIS OWN IMAGE. L. R.

THINGS TALKED OF IN LONDON.

April 1851.

You must be prepared, when you come up to the gathering of the nations, to see some changes in the shop-fronts of the metropolis. Small panes and low-browed windows are fast disappearing from our leading thoroughfares, to make way for a brilliant and lofty expanse of plate-glass. Here and there premises are enlarged by taking in adjoining houses—a development of enterprise which most prevails among tavern, coffee, and eating-house-keepers, particularly in the vicinity of the Crystal Palace, where the superadded rooms afford a busy scene of carpentry, painting, and papering. It is a rare time for decorators; and purveyors of refreshments intend that it shall not be less so for them. All this is a carrying out of the 'fixed idea,' that speculations in the commissariat department are sure to pay. Monsieur Soyer, at all events, inclines to that belief; for he has taken Gore House, the residence of the late Lady Blessington, where he will play the part of a *restaurateur en grand*. There is some talk of establishing 'penny news-rooms,' where foreigners and others may find newspapers and periodicals in their own vernacular, and read, write, or rest at pleasure. Such establishments are a very great convenience, not less to residents than to strangers; and I for one should rejoice to see several started in London on as liberal a scale as that in Waterloo Place, Edinburgh: so far as my experience goes, there is nothing in Cockneydom equal to it. The Society of Arts have it in contemplation to do the hospitable in this respect, and to supply edible as well as readable matter. Further, we are promised a troop of shoe-blacks—urchins from our Ragged Schools, trained and taught for the occasion—who are to be stationed in streets and squares during the six months of the Exhibition. Some people say that it would be desirable to go a step beyond this, and establish *salles de toilette*, as in Paris; indeed if projectors could have their way, London would become a sort of mongrel metropolis, in which the citizens of all the capitals in the world should fancy themselves at home, and wax rotund withal. When all preparations shall be complete, and the wealth and taste of our shops and warehouses are lit up by the rays of a summer sun, there will doubtless be some among the myriads of visitors thronging our streets who will be tempted to exclaim with old Marshal Blucher—'What a city for to sack!'

I walked up to Hyde Park about a fortnight ago on a Sunday afternoon, to see the folk who had come to view the Hall of Glass. There was no disappointment in the result; for the mighty moving throngs were well-dressed and well-conducted, while the coarse material out of which mobs are composed was extremely rare. In consequence, too, of the police regulations against Sunday trading within the limits of the Park, there was none of that confusion and outcry of huxsters so prevalent on other days. It was not difficult to see that the crowd was composed chiefly of mechanics, clerks, and retail tradesmen, with their wives and sweethearts, and domestic servants, male and female, all in their 'go-to-meeting clothes,' besides a sprinkling of soldiers.

It would interest you somewhat, while walking in the Strand or Piccadilly, to see how heavily-laden wagons, from time to time, go rumbling westward with

goods for the Exhibition. Habituated as the street population of London are to the sight of huge vehicles, they cannot help gazing at the piles of cases as they are drawn slowly by, with their foreign marks, from Paris, Austria, Bavaria, or some other place in the Zoll Verein. The number of cases arrived is, up to the time of my writing, 12,596; being 6283 foreign, 767 colonial, 26 Channel Islands, and 5570 native. The *St Lawrence* brought, it is said, nearly 1000 tons of goods, and 500 exhibitors. Some of the latter are not very well satisfied with the arrangements; but it is to be presumed that they will do as other foreigners have seen the propriety of doing—that is, conform to the regulations of the Exhibition Commissioners, who would not be human if they could please everybody. While 3000 have been excluded out of the 9000 native Britons who came forward as exhibitors, some of the foreigners may, without unfairness, be expected to give place to such of their compatriots as bring the most novel or suitable articles for show. The objects exhibited are to be divided into thirty classes; and there will be as many juries—one to each class—to determine on the objects for which prizes shall be awarded; and according to their decision exhibitors will receive first, second, or third class medals. The number of jurors will be 270, one-half of them being foreigners; and the chairmen to be a sort of upper council, to weigh the merits of the respective adjudications. They are to enter on their duties on the 12th May. These juries have a delicate and difficult task before them, from which it will be no more than charitable to wish them a happy deliverance.

The movement hitherwards has already begun to some extent: in walking our streets, it is impossible not to observe the presence of many more foreigners than usual. Silliman has arrived from the United States, and brings news of other American *savans* who are to follow. And still more remarkable, two Chinese merchants, Ahung and Ry, have come overland through Tartary, Russia, and Germany, to see the Exhibition, preferring that long journey to the voyage by sea, which several of their acquaintances have undertaken in a junk. Should this junk really arrive, the Celestials will deserve no small credit for their enterprise. With so many visitors from abroad, may we not expect a more than usually interesting meeting of the British Association at Ipswich next July?

Now and then a little information creeps out as to the nature and quality of the articles sent in for exhibition. There is a bedstead from India profusely ornamented with silver filagree, the metal alone being worth L.800; there is a saddle also valued at 1700 guineas, far more costly than handsome; and a tea-service, of which each cup and saucer is worth 100 guineas. They are made of agate set with emeralds and rubies, but will not, any more than the saddle, be admired for beauty, and for taste and elegance, will bear no comparison with our Wedgwood china. Singapore, in addition to a number of Malay manufactures and curiosities, sends a valuable collection of the natural products of the Eastern Archipelago, including edible birds-nests, and the sea-weed and sea-slugs so much relished by the gourmands of China. Among the articles from Munich is a 'beer watch,' which, by the movement of its hands, indicates the quantity of the fluid swallowed by the wearer; and among those from Switzerland is a gold pen-holder, with a miniature watch fitted at one extremity, which, small as it is, tells the day of the month as well as the hour. Vienna, as I have before told you, has sent us some very choice cabinet furniture, and with it a number of moustachioed workmen, who, by the assiduity with which they fit up the articles within their boarding, and the use they make of their peculiar benches and tools, have attracted considerable notice. The 'pass' system is still rigorously enforced at the building; so much so, that a batch of the Executive

Committee, who arrived one morning at the door after a change had been made in the ticket, were kept waiting for an hour or two before they could gain admittance.

Many projects are afoot for public accommodation; and one, not the least acceptable, is an improved omnibus. It has long been a complaint that the omnibuses of Paris and Brussels should be superior to those of London, and the new vehicle is to obviate the objections to the old ones. Each passenger is to have a compartment to himself; and the seats on the roof are reached by a convenient stair, instead of the present awkward and imperfect method of mounting, which, by the way, is essentially *townish*; for it is notorious that Londoners submit to flagrant inconveniences in their crowded streets and public vehicles, at steam-boat landings and doors of theatres, with a power of endurance quite extraordinary. Nevertheless, it is but fair to record that the city authorities have deliberated on the improvement of the river landing-places, and on projects for underground crossings in streets where the vehicular crush renders the traverse difficult and dangerous. It is hard to imagine what is to become of foreigners, who in their own towns are so much accustomed to walk in the roadway; if they pursue the same practice here, they will soon learn to attach a meaning to the 'Now, then!' of irate conductors and drivers.

Another peculiarity that will attract the attention of transmarine visitors, will be the want of cleanliness and convenience in the carriages of some of our railway lines. In my travelling experiences abroad, and no farther off than the north of the Tweed, the comfort of travellers is much more considered than on certain of the lines which radiate from the metropolis. There are, it is true, honourable exceptions; and now that competition has become active, we may expect to find preference given to those lines which provide the best-appointed carriages.

There are certain miscellaneous matters which have been duly talked about by those therein interested. One is, that Adams—Neptune Adams, as he is now called—was elected president of the Astronomical Society at their last anniversary. Theologians have found wherewith to interest themselves in the reports that have been received of the conference of the Bishop of Victoria at Hong-Kong with an intelligent native of China, respecting the term by which the name *God* is to be rendered into the Chinese language. This, as you are aware, has for some time been a vexed question, owing to the number of terms used to signify the various classes of gods among the natives of the 'central flowery land.' This conference may be looked on as a step towards its solution. I may mention, too, while on the subject of language, that several standard English words are to be translated into the vernacular dialects of India, in aid of the educational movement among the native population. Think of Gibbon, Hume, and Smollett, and Defoe, and several of your own 'Educational Course,' done into Hindoo characters! There is philological matter, also, of considerable importance from Africa. The first example of a native written language has recently been discovered among the inhabitants of the *Vei* or *Vahie* district, about five days' sail to the south-east of Sierra Leone, and twenty miles in the interior. They were visited by a missionary, who found, as had been reported, several manuscript books, the work of Doalu Bukara, the Ethiopian Cadmus, a devout and intelligent native. The alphabet which he produced, with the assistance of some of his friends, is entirely phonetic; and, as he related, was the result of a dream which he dreamt some sixteen years ago. He is now about forty; and it appears that, when a boy, he received some alphabetical instruction from an American missionary, which may perhaps account for the peculiar nature and consequences of his dream. When once the

alphabet was invented, the king's permission to establish schools and teach the people was obtained; and notwithstanding the interruptions occasioned by war, progress has been made in the way of education. Three of the manuscripts have been brought to England. They describe the ordinary incidents and circumstances of negro life, in a style adapted to engage the attention of those for whom they are designed. A number of copies have been lithographed on coloured papers, to render them more attractive; and are to be sent out for circulation among the natives, in the hope, as is said, 'of leading them on in the pursuit of literature, and thus encouraging the peaceful arts, and checking the slave trade.' The Vei district comprehends some 200,000 square miles; an ample field on which to commence the spread of enlightenment.

The centre of Leicester Square no longer presents any appearance of that 'décadence' which afforded so voluminous a topic to a certain literary politician. Mr Wyld's circular building now rears its domed roof aloft in that spacious area; and judging from present indications, the 'Great Globe Exhibition' will not prove the least interesting of metropolitan sights for some time to come. There is to be a 'Gas Exhibition' too at the Polytechnic; the proprietors of that institution having afforded the necessary space, as fire and flame are to be excluded from the Crystal Palace. And, talking of gas, a firm at Carlisle have contrived an illuminated turret clock, which, being regulated every six months, will light itself up at sunset, and 'go out' at sunrise, during the half year, adapting itself all the time to the increase and decrease of daylight. Rather a clever clock this! Then there is an enterprising farmer—I believe not in Essex—who is going to roof his barn with glass, so that after his wheat shall be cut, it may be hardened and dried in full sunlight under shelter. And architects are talking about the model labourers' cottages, to be built of hollow glazed bricks, near Knightsbridge Barracks, at Prince Albert's expense; and of a design for somewhat similar edifices by one of the sons of the Lord Chief Baron.

One or two more, and then I shall have come to the end of what Lord Duberly would call 'promiscuous' items. A lively debate is going on among engineers as to the best form of steamers' paddle-floats, heightened perhaps by the rivalry in ocean steam navigation. If increased speed, without diminution of safety, is to come out of it, we shall wish success to the gentlemen's talk. Another subject is telegraph extension, with a view to establish a line between London and Liverpool, which shall be independent of the present monopoly. The Americans have lately begun to employ their telegraphs for a purpose of great importance to maritime communities, and indeed to all who are dependent on weather. They give notice of storms: 'For example, the telegraph at Chicago and Toledo notifies shipmasters at Cleveland and Buffalo, and also on Lake Ontario, of the approach of a north-west storm. The result is practically of great importance. A hurricane storm traverses the atmosphere at the rate of a carrier-pigeon—namely, sixty miles an hour. A vessel in the port of New York, about to sail for New Orleans, may be telegraphed, twenty hours in advance, that a south-west storm is advancing along the coast from the Gulf of Mexico.' We here in the southern counties might thus have been forewarned against the extraordinary rain-storm of March 15, when there fell in London nearly two inches of rain in fifteen hours—a quantity unexampled (that is, in the same space of time) in the annals of meteorology. It is worthy of notice that no rain fell on the same day at Nottingham or York, and scarcely any at Liverpool.

There, I think, you ought to be satisfied. It is not every editor who has a correspondent capable of producing any amount of what geologists call 'conglomerate.' So, farewell till the Exhibition opens.

THE SMUGGLER MALGRÉ LUI.

THERE is perhaps no more singular anomaly in the history of the human mind than the very different light in which a fraud is viewed according to the circumstances in which it is practised. The singular revelations made to the Chancellor of the Exchequer by a late deputation will probably be fresh in the remembrance of most of our readers. Even the learned gentleman himself could hardly maintain his professional gravity when informed of the ingenious contrivances adopted for defrauding the revenue. Advertisements floating through the air attached to balloons, French gloves making their way into the kingdom in separate detachments of right and left hands, mutilated clocks travelling without their wheels—such were some of the divers modes by which the law was declared to be evaded, and the custom-house officers baffled. We are by no means disposed either to think or speak with levity of this system of things. However much a man may succeed in reconciling any fraud to his own conscience, or however leniently it may be viewed by his fellow-men, it will yet assuredly help to degrade his moral nature, and its repetition will slowly, but surely, deaden the silent monitor within his breast. All we affirm is the well-known fact, that laws are in most cases ineffective, except in so far as they harmonise with the innate moral convictions of mankind; and that many a man who would not for worlds cheat his next-door neighbour of a penny, will own without a blush, and perhaps even with a smile of triumph, that he has cheated the government of thousands! It is not often, however, that so daring and successful a stroke of this nature is effected as that which we find related of a celebrated Swiss jeweller, who actually succeeded in making the French director-general of the customs act the part of a smuggler!

Geneva, as must be well known to all our readers, supplies half Europe with her watches and her jewellery. Three thousand workmen are kept in continual employment by her master goldsmiths; while seventy-five thousand ounces of gold, and fifty thousand marks of silver, annually change their form, and multiply their value beneath their skilful hands! The most fashionable jeweller's shop in Geneva is unquestionably that of Beautte: his trinkets are those which beyond all others excite the longing of the Parisian ladies. A high duty is charged upon these in crossing the French frontier; but, in consideration of a brokerage of 5 per cent., M. Beautte undertakes to forward them safely to their destination through contraband channels; and the bargain between the buyer and seller is concluded with this condition as openly appended and avowed as if there were no such personages as custom-house officers in the world.

All this went on smoothly for some years with M. Beautte; but at length it so happened that M. le Comte de Saint-Cricq, a gentleman of much ability and vigilance, was appointed director-general of the customs. He heard so much of the skill evinced by M. Beautte in eluding the vigilance of his agents, that he resolved personally to investigate the matter, and prove for himself the truth of the reports. He consequently repaired to Geneva, presented himself at M. Beautte's shop, and purchased 30,000 francs' worth of jewellery, on the express condition that they should be transmitted to him free of duty on his return to Paris. M. Beautte accepted the proposed condition with the air of a man who was perfectly accustomed to arrangements of this description. He, however, presented for signature to M. de Saint-Cricq a private deed, by which the purchaser pledged himself to pay the customary 5 per cent. *smuggling dues*, in addition to the 30,000 francs' purchase-money.

M. de Saint-Cricq smiled, and taking the pen from the jeweller's hand, affixed to the deed the following

signature—'L. de Saint-Cricq, Director-General of the Customs in France.' He then handed the document back to M. Beautte, who merely glanced at the signature, and replied, with a courteous bow—

'*Monsieur le Directeur des Douanes*, I shall take care that the articles which you have done me the honour of purchasing shall be handed to you in Paris directly after your arrival.' M. de Saint-Cricq, piqued by the man's cool daring and apparent defiance of his authority and professional skill, immediately ordered post-horses, and without the delay of a single hour set out with all speed on the road to Paris.

On reaching the frontier, the Director-General made himself known to the *employés* who came forward to examine his carriage—informed the chief officer of the incident which had just occurred, and begged of him to keep up the strictest surveillance along the whole of the frontier line, as he felt it to be a matter of the utmost importance to place some check upon the wholesale system of fraud which had for some years past been practised upon the revenue by the Geneva jewellers. He also promised a gratuity of fifty louis-d'ors to whichever of the *employés* should be so fortunate as to seize the prohibited jewels—a promise which had the effect of keeping every officer on the line wide awake, and in a state of full activity, during the three succeeding days.

In the meanwhile M. de Saint-Cricq reached Paris, alighted at his own residence, and after having embraced his wife and children, and passed a few moments in their society, retired to his dressing-room, for the purpose of laying aside his travelling costume. The first thing which arrested his attention when he entered the apartment was a very elegant-looking casket, which stood upon the mantelpiece, and which he did not remember to have ever before seen. He approached to examine it; his name was on the lid; it was addressed in full to 'M. le Comte de Saint-Cricq, Director-General of Customs.' He accordingly opened it without hesitation, and his surprise and dismay may be conceived when, on examining the contents, he recognised at once the beautiful trinkets he had so recently purchased in Geneva!

The count rung for his valet, and inquired from him whether he could throw any light upon this mysterious occurrence. The valet looked surprised, and replied, that on opening his master's portmanteau, the casket in question was one of the first articles which presented itself to his sight, and its elegant form and elaborate workmanship having led him to suppose it contained articles of value, he had carefully laid it aside upon the mantelpiece. The count, who had full confidence in his valet, and felt assured that he was in no way concerned in the matter, derived but little satisfaction from this account, which only served to throw a fresh veil of mystery over the transaction; and it was only some time afterwards, and after long investigation, that he succeeded in discovering the real facts of the case.

Beautte the jeweller had a secret understanding with one of the servants of the hotel at which the Comte de Saint-Cricq lodged in Geneva. This man, taking advantage of the hurried preparations for the count's departure, contrived to slip the casket unperceived into one of his portmanteaus, and the ingenious jeweller had thus succeeded in making the Director-General of Customs one of the most successful *smugglers* in the kingdom!

HAIL-STORMS IN INDIA.

Colonel Sykes has described to the British Association several storms of hail which have occurred in India, the details collected from various sources by Dr Buist. The weight of some masses of ice was over 14 lbs. Many of them, under a rough external coat, contained clear ice within, and with that peculiar radiated structure which

he had elsewhere described. Immense aggregated masses of these great hail-stones were in some places brought down from the mountain ravines by the succeeding torrents, and in one of these conglomerations a snake was found frozen up, and apparently dead; but it soon thawed, and revived.

ON A WEDDING.

February 25, 1851.

You are to be married, Mary:

This hour, as I silent lie
In the dreamy light of the morning,
Your wedding-hour draws nigh.
Miles off, you are rising, dressing,
To stand amid bridal throng,
In the same old rooms we played in,
You and I—when we were young.

Your bridesmaids—they were our playmates;
Those old rooms, every wall,
Could speak of our childish frolics,
Love, jealousies, great and small.
Do you mind how pansies changed we,
And smiled at the word 'forget!'—
'Twas a girl's romance—yet somewhere
I have kept my pansy yet.

Do you mind our verses written
Together! our dreams of fame!—
Of love—how we'd share all secrets
When that sweet mystery came!
It is no mystery now, Mary;
It was unveiled year by year:
Till—this is your marriage-morning,
And I—I am lying here.

I cannot picture your face, Mary,
The face of the bride to-day:
You have outgrown my knowledge
In years that have slipped away:
I see but the girlish likeness,
Brown eyes, and brown falling hair:
God knows, I did love you dearly,
And was proud that you were fair!

Many speak my name, Mary,
While yours in home's silence lies:
The future I read in toil's guerdon,
You will read in your children's eyes.
The past—the same past with either—
Is to you a soft, pleasant scene:
But I cannot see it clearly,
For the graves that rise between.

I am glad you are happy, Mary!
These tears, did you see them fall,
Would shew, though you have forgotten,
I have remembered all.
And though my cup is left empty,
And yours with its joy runs o'er,
God keep you its sweetness, Mary,
Brimming for evermore!

MORBID IMPULSES.

'PLEASE, sir, it's seven o'clock, and here's your hot war.' I half awoke, reflected moodily on the unhappy destiny of early risers; and finally, after many turns and grunts, having decided upon defying all engagements and duties, I fell asleep once more. In an instant I was seated in the pit of Her Majesty's Theatre, gazing upon the curtain, and, in common with a large and brilliant audience, anxiously awaiting its arising, and the appearance of Duprez. The curtain does rise; the orchestra are active; Duprez has bowed her thanks to an applauding concourse; and the opera is half concluded: when, just as the theatre is hushed into death-like silence for the great aria which is to test Duprez's capacity and power, a mad impulse seizes hold of me. I have an intense desire to yell. I feel as if my life and my eternal happiness depend upon my emulating a wild Indian, or a London 'coster' boy. I look round on the audience; I see their solemn faces; I note the swelling bosom of the cantatrice, the rapt anxiety of the leader, and the dread silence of the whole assembly, and I speculate on the surprise and confusion a loud war-whoop yell would create; and though I foresee an ignominious expulsion, perhaps broken limbs and disgraceful exposure in the public prints, I cannot resist the strange impulse; and throwing myself back in my stall, I raise a wild cry, such as a circus clown gives when he vaults into the arena, and ties himself up into a knot by way of introduction. I had not under-calculated the confusion, but I had under-calculated the indignation. In an instant all eyes are upon me—from the little piccolo player in the corner of the orchestra to the diamonded duchess in the private box; cries of 'Shame! turn him out!' salute me on all sides; my neighbours seize me by the collar, and call for the police; and in five minutes, ashamed, bruised, and wretched, I am ejected into the Haymarket, and on my way to Bow Street.

'Please, sir, it's nine o'clock now; and Mr Biggs has been, sir; and he couldn't wait, sir; and he'll come again at two.'

I sit up in bed, rub my eyes, and awake to consciousness of two facts—namely, that I have not kept a very particular engagement, and that I have had a strange dream. I soon forget the former, but the latter remains with me for a long time very vividly. It *was* a dream, I know; but still it *was* so true to what might have occurred, that I half fancy I shall recognise myself among the police intelligence in my daily paper; and when I have read the 'Times' throughout, and find it *was* indeed a dream, the subject still haunts me, and I sit for a long time musing upon those singular morbid

desires and impulses which all men more or less experience.

What are they? Do they belong strictly to the domain of physics or of metaphysics? How nearly are they allied to insanity? May there not be a species of spiritual intoxication created by immaterial alcohol, producing, through the medium of the mind, the same bodily absurdities as your fluid alcohol produces through the directer agency of the body itself? How far can they be urged as extenuating or even defending misdeemeanours and crimes? To guide me in my speculations, I run over a few cases that I can call to mind at once.

There is the general fact, that no sooner have you mounted to a great eminence, than a mysterious impulse urges you to cast yourself over into space, and perish. Nearly all people feel this; nearly all conquer it in this particular; but some do not: and there may be a great doubt as to whether all who have perished from the tops of the monuments have been truly suicides. Then, again, with water: when you see the clear river sleeping beneath—when you see the green waves dancing round the prow—when you hear and see the roaring fury of a cataract—do you not as surely feel a desire to leap into it, and be absorbed in oblivion? What is that impulse but a perpetual calenture?—or may not the theory of calentures be all false, and the results they are reported to cause be in reality the results of morbid impulses? I have sat on the deck of a steamer, and looked upon the waters as they chafed under the perpetual scouring of the paddles; and I have been compelled to bind myself to the vessel by a rope, to prevent a victory to the morbid impulses that has come upon me. Are not Ulysses and the Syrens merely a poetic statement of this common feeling?

But one of the most singular instances of morbid impulses in connection with material things, exists in the case of a young man who not very long ago visited a large iron manufactory. He stood opposite a huge hammer, and watched with great interest its perfectly regular strokes. At first it was beating immense lumps of crimson metal into thin, black sheets; but the supply becoming exhausted, at last it only descended on the polished anvil. Still the young man gazed intently on its motion; then he followed its strokes with a corresponding motion of his head; then his left arm moved to the same tune; and finally, he deliberately placed his fist upon the anvil, and in a second it was smitten to a jelly. The only explanation he could afford was that he felt an impulse to do it; that he knew he should be disabled; that he saw all the consequences in a misty kind of manner; but that he still felt a power within, above sense and reason—a

morbid impulse, in fact, to which he succumbed, and by which he lost a good right hand. This incident suggests many things, besides proving the peculiar nature and power of morbid impulses: such things, for instance, as a law of sympathy on a scale hitherto undreamt of, as well as a musical tune pervading all things.

But the action of morbid impulses and desires is far from being confined to things material. Witness the occurrence of my dream, which, though a dream, was true in spirit. More speeches, writings, and actions of humanity have their result in morbid impulse than we have an idea of. Their territory stretches from the broadest farce to the deepest tragedy. I remember spending an evening at Mrs Cantaloupe's, and being seized with an impulse to say a very insolent thing. Mrs Cantaloupe is the daughter of a small pork butcher, who, having married the scapegrace younger son of a rich man, by a sudden sweeping away of elder brethren, found herself at the head of a mansion in Belgravia, and of an ancient family. This lady's pride of place, and contempt for all beneath her, exceeds any thing I have ever yet seen or heard of; and, one evening when she was canvassing the claims of a few *parvenu* families in her usual *tranchant* and haughty manner, an impulse urged me to cry, at the top of my voice: 'Madam, your father was a little pork-butcher—you know he was!'

In vain I tried to forget the fact; in vain I held my hands over my mouth to prevent my shouting out these words. The more I struggled against it, the more powerful was the impulse; and I only escaped it by rushing headlong from the room and from the house. When I gained my own chambers, I was so thankful that I had avoided this gross impertinence that I could not sleep.

This strange thralldom to a morbid prompting not unfrequently has its outlet in crimes of the deepest dye. When Lord Byron was sailing from Greece to Constantinople, he was observed to stand over the sleeping body of an Albanian, with a poniard in his hand; and, after a little time, to turn away muttering, 'I should like to know how a man feels who has committed a murder!' There can be no doubt that Lord Byron, urged by a morbid impulse, was on the very eve of knowing what he desired; and not a few crimes have their origin in a similar manner. The facts exist; the evidence is here in superabundance; but what to do with it? Can a *theory* be made out? I sit and reflect.

There are two contending parties in our constitution—mind and matter, spirit and body—which in their conflicts produce nearly all the ills that flesh is heir to. The body is the chief assailant, and generally gains the victory. Look how our writers are influenced by bile, by spleen, by indigestion; how families are ruined by a bodily ailment sapping the mental energy of their heads. But the spirit takes its revenge in a guerilla war, which is incessantly kept up by these morbid impulses—an ambuscade of them is ever lurking to betray the too-confident body. Let the body be unguarded for an instant, and the spirit shoots forth its morbid impulse; and if the body be not very alert, over it goes into the sea, into the house-tops, or into the streets and jails. In most wars the country where the fighting takes place suffers most: in this case man is the battleground; and he must and will suffer so long as mind and matter, spirit and body, do not co-operate amicably—so long as they fight together, and are foes. Fortunately, the remedy can be seen. If the body do not aggress, the spirit will not seek revenge. If you keep the body from irritating, and perturbing, and stultifying the mind through its bile, its spleen, its indigestion, its brain, the mind will most certainly never injure, stultify, or kill the body by its mischievous guerilla tactics, by its little, active, implike agents—morbid impulses. We thus find that there is a deep truth in utilitarianism after all—the rose-colour romancings of

chameleon writers. To make a man a clear-judging member of society, doing wise actions in the present moment, and saying wise and beautiful things for all time, a great indispensable is—to see that the house that his spirit has received to dwell in be worthy the wants and capabilities of its noble occupant. Hence—
Rat-tat-ta-tat!

'Please, sir, Mr Biggs!'

RECOLLECTIONS OF A POLICE-OFFICER.

MARY KINGSFORD.

TOWARDS the close of the year 1836, I was hurriedly despatched to Liverpool for the purpose of securing the person of one Charles James Marshall, a collecting clerk, who, it was suddenly discovered, had absconded with a considerable sum of money belonging to his employers. I was too late—Charles James Marshall having sailed in one of the American liners the day before my arrival in the northern commercial capital. This fact well ascertained, I immediately set out on my return to London. Winter had come upon us unusually early; the weather was bitterly cold; and a piercing wind caused the snow, which had been falling heavily for several hours, to gyrate in fierce, blinding eddies, and heaped it up here and there into large and dangerous drifts. The obstruction offered by the rapidly-congealing snow greatly delayed our progress between Liverpool and Birmingham; and at a few miles only distant from the latter city, the leading engine ran off the line. Fortunately, the rate at which we were travelling was a very slow one, and no accident of moment occurred. Having no luggage to care for, I walked on to Birmingham, where I found the parliamentary train just on the point of starting, and with some hesitation, on account of the severity of the weather, I took my seat in one of the then very much exposed and uncomfortable carriages. We travelled steadily and safely, though slowly along, and reached Rugby Station in the afternoon, where we were to remain, the guard told us, till a fast down-train had passed. All of us hurried as quickly as we could to the large room at this station, where blazing fires and other appliances soon thawed the half-frozen bodies, and loosened the tongues of the numerous and motley passengers. After recovering the use of my benumbed limbs and faculties, I had leisure to look around and survey the miscellaneous assemblage about me.

Two persons had travelled in the same compartment with me from Birmingham, whose exterior, as disclosed by the dim light of the railway carriage, created some surprise that such finely-attired, fashionable gentlemen should stoop to journey by the plebeian penny-a-mile train. I could now observe them in a clearer light, and surprise at their apparent condescension vanished at once. To an eye less experienced than mine in the artifices and expedients familiar to a certain class of 'swells,' they might perhaps have passed muster for what they assumed to be, especially amidst the varied crowd of a 'parliamentary,' but their copper finery could not for a moment impose upon me. The watch-chains were, I saw, mosaic; the watches, so frequently displayed, gilt; eye-glasses the same; the coats, fur-collared and cuffed, were ill-fitting and second-hand; ditto of the varnished boots and renovated velvet waist-coats; while the luxuriant moustaches and whiskers, and flowing wigs, were unmistakably mere *pièces d'occasion*—assumed and diversified at pleasure. They were both apparently about fifty years of age; one of them perhaps one or two years less than that. I watched them narrowly, the more so from their making themselves ostentatiously attentive to a young woman—girl rather she seemed—of a remarkably graceful figure, but whose face I had not yet obtained a glimpse of. They made boisterous way for her to the fire, and were profuse and noisy in their offers of refreshment—all of

which, I observed, were peremptorily declined. She was dressed in deep, unexpensive mourning; and from her timid gestures and averted head, whenever either of the fellows addressed her, was, it was evident, terrified as well as annoyed by their rude and insolent notice. I quietly drew near to the side of the fireplace at which she stood, and with some difficulty obtained a sight of her features. I was struck with extreme surprise—not so much at her singular beauty, as from an instantaneous conviction that she was known to me, or at least that I had seen her frequently before, but where or when I could not at all call to mind. Again I looked, and my first impression was confirmed. At this moment the elder of the two men I have partially described placed his hand, with a rude familiarity, upon the girl's shoulder, proffering at the same time a glass of hot brandy and water for her acceptance. She turned sharply and indignantly away from the fellow; and looking round as if for protection, caught my eagerly-fixed gaze.

'Mr Waters!' she impulsively ejaculated. 'Oh I am so glad!'

'Yes, I answered, 'that is certainly my name; but I scarcely remember— Stand back, fellow!' I angrily continued, as her tormentor, emboldened by the spirits he had drank, pressed with a jeering grin upon his face towards her, still tendering the brandy and water. 'Stand back!' He replied by a curse and a threat. The next moment his flowing wig was whirling across the room, and he standing with his bullet-head here but for a few locks of iron-gray, in an attitude of speechless rage and confusion, increased by the peals of laughter which greeted his ludicrous, unwigged aspect. He quickly put himself in a fighting attitude, and, backed by his companion, challenged me to battle. This was quite out of the question; and I was somewhat at a loss how to proceed, when the bell announcing the instant departure of the train rang out, my furious antagonist gathered up and adjusted his wig, and we all sallied forth to take our places—the young woman holding fast by my arm, and in a low, nervous voice, begging me not to leave her. I watched the two fellows take their seats, and then led her to the hindmost carriage, which we had to ourselves as far as the next station.

'Are Mrs Waters and Emily quite well?' said the young woman colouring, and lowering her eyes beneath my earnest gaze, which she seemed for a moment to misinterpret.

'Quite—entirely so,' I almost stammered. 'You know us then?'

'Surely I do,' she replied, reassured by my manner. 'But you, it seems,' she presently added with a winning smile, 'have quite forgotten little Mary Kingsford.'

'Mary Kingsford!' I exclaimed almost with a shout. 'Why, so it is! But what a transformation a few years have effected!'

'Do you think so? Not pretty Mary Kingsford now then, I suppose?' she added with a light, pleasant laugh.

'You know what I mean, you vain puss you!' I rejoined quite gleefully; for I was overjoyed at meeting with the gentle, well-remembered playmate of my own eldest girl. We were old familiar friends—almost father and daughter—in an instant.

Little Mary Kingsford, I should state, was, when I left Yorkshire, one of the prettiest, most engaging children I had ever seen; and a petted favourite not only with us, but of every other family in the neighbourhood. She was the only child of Philip and Mary Kingsford—a humble, worthy, and much-respected couple. The father was gardener to Sir Pyott Dalzell, and her mother eked out his wages to a respectable maintenance by keeping a cheap children's school. The change which a few years had wrought in the beautiful child was quite sufficient to account for my

imperfect recognition of her; but the instant her name was mentioned, I at once recognised the rare comeliness which had charmed us all in her childhood. The soft brown eyes were the same, though now revealing profounder depths, and emitting a more pensive expression; the hair, though deepened in colour, was still golden; her complexion, lit up as it now was by a sweet blush, was brilliant as ever; whilst her child-person had become matured and developed into womanly symmetry and grace. The brilliancy of colour vanished from her cheek as I glanced meaningly at her mourning dress.

'Yes,' she murmured in a sad quivering voice—'yes, father is gone! It will be six months come next Thursday that he died! Mother is well,' she continued more cheerfully after a pause, 'in health, but poorly off; and I—and I,' she added with a faint effort at a smile, 'am going to London to seek my fortune!'

'To seek your fortune!'

'Yes; you know my cousin, Sophy Clarke? In one of her letters, she said she often saw you.'

I nodded without speaking. I knew little of Sophia Clarke, except that she was the somewhat gay, coquettish shopwoman of a highly-respectable confectioner in the Strand, whom I shall call by the name of Morris.

'I am to be Sophy's fellow shop-assistant,' continued Mary Kingsford; 'not of course at first at such good wages as she gets. So lucky for me, is it not, since I must go to service? And so kind, too, of Sophy to interest herself for me!'

'Well, it may be so. But surely I have heard—my wife at least has—that you and Richard Westlake were engaged?—Excuse me, Mary, I was not aware the subject was a painful or unpleasant one.'

'Richard's father,' she replied with some spirit, 'has higher views for his son. It is all off between us now,' she added; 'and perhaps it is for the best that it should be so.'

I could have rightly interpreted these words without the aid of the partially-expressed sigh which followed them. The perilous position of so attractive, so inexperienced, so guileless a young creature, amidst the temptations and vanities of London, so painfully impressed and preoccupied me, that I scarcely uttered another word till the rapidly-diminishing rate of the train announced that we neared a station, after which it was probable we should have no farther opportunity for private converse.

'Those men—those fellows at Rugby—where did you meet with them?' I inquired.

'About thirty or forty miles below Birmingham, where they entered the carriage in which I was seated. At Birmingham I managed to avoid them.'

Little more passed between us till we reached London. Sophia Clarke received her cousin at the Euston station, and was profuse of felicitations and compliments upon her arrival and personal appearance. After receiving a promise from Mary Kingsford to call and take tea with my wife and her old playmate on the following Sunday, I handed the two young women into a cab in waiting, and they drove off. I had not moved away from the spot when a voice a few paces behind me, which I thought I recognised, called out: 'Quick, coachee, or you'll lose sight of them!' As I turned quickly round, another cab drove smartly off, which I followed at a run. I found, on reaching Lower Seymour Street, that I was not mistaken as to the owner of the voice, nor of his purpose. The fellow I had unwigged at Rugby thrust his body half out of the cab window, and pointing to the vehicle which contained the two girls, called out to the driver 'to mind and make no mistake.' The man nodded intelligence, and lashed his horse into a faster pace. Nothing that I might do could prevent the fellows from ascertaining Mary Kingsford's place of abode; and as that was all that, for the present at least, need be appre-

hended, I desisted from pursuit, and bent my steps homewards.

Mary Kingsford kept her appointment on the Sunday, and in reply to our questioning, said she liked her situation very well. Mr and Mrs Morris were exceedingly kind to her; so was Sophia. 'Her cousin,' she added in reply to a look which I could not repress, 'was perhaps a little gay and free of manner, but the best-hearted creature in the world.' The two fellows who had followed them had, I found, already twice visited the shop; but their attentions appeared now to be exclusively directed towards Sophia Clarke, whose vanity they not a little gratified. The names they gave were Hartley and Simpson. So entirely guileless and unsophisticated was the gentle country maiden, that I saw she scarcely comprehended the hints and warnings which I threw out. At parting, however, she made me a serious promise that she would instantly apply to me should any difficulty or perplexity overtake her.

I often called in at the confectioner's, and was gratified to find that Mary's modest propriety of behaviour, in a somewhat difficult position, had gained her the goodwill of her employers, who invariably spoke of her with kindness and respect. Nevertheless, the cark and care of a London life, with its incessant employment and late hours, soon, I perceived, began to tell upon her health and spirits; and it was consequently with a strong emotion of pleasure I heard from my wife that she had seen a passage in a letter from Mary's mother, to the effect that the elder Westlake was betraying symptoms of yielding to the angry and passionate expostulations of his only son, relative to the enforced breaking off of his engagement with Mary Kingsford. The blush with which she presented the letter was, I was told, very eloquent.

One evening, on passing Morris's shop, I observed Hartley and Simpson there. They were swallowing custards and other confectionary with much gusto; and, from their new and costly habiliments, seemed to be in surprisingly good case. They were smirking and smiling at the cousins with rude confidence; and Sophia Clarke, I was grieved to see, repaid their insulting impertinence by her most elaborate smiles and graces. I passed on; and presently meeting with a brother-detective, who, it struck me, might know something of the two gentlemen, I turned back with him, and pointed them out. A glance sufficed him.

'Hartley and Simpson you say?' he remarked after we had walked away to some distance: 'those are only two of their numerous *aliases*. I cannot, however, say that I am as yet on very familiar terms with them; but as I am especially directed to cultivate their acquaintance, there is no doubt we shall be more intimate with each other before long. Gamblers, blacklegs, swindlers, I already know them to be; and I would take odds they are not unfrequently something more, especially when fortune and the bones run cross with them.' 'They appear to be in high feather just now,' I remarked.

'Yes: they are connected, I suspect, with the gang who cleaned out young Garslade last week in Jermyn Street. I'd lay a trifle,' added my friend, as I turned to leave him, 'that one or both of them will wear the Queen's livery, gray turned up with yellow, before many weeks are past. Good-by.'

About a fortnight after this conversation, I and my wife paid a visit to Astley's, for the gratification of our youngsters, who had long been promised a sight of the equestrian marvels exhibited at that celebrated amphitheatre. It was the latter end of February; and when we came out of the theatre, we found the weather had changed to dark and sleety, with a sharp, nipping wind. I had to call at Scotland-Yard; my wife and children consequently proceeded home in a cab without me; and after assisting to quell a slight disturbance originating in a gin-palace close by, I went on my way

over Westminster Bridge. The inclement weather had cleared the streets and thoroughfares in a surprisingly short time; so that, excepting myself, no foot-passenger was visible on the bridge till I had about half-crossed it, when a female figure, closely muffled up about the head, and sobbing bitterly, passed rapidly by on the opposite side. I turned and gazed after the retreating figure: it was a youthful, symmetrical one; and after a few moments' hesitation, I determined to follow at a distance, and as unobservedly as I could. On the woman sped, without pause or hesitation, till she reached Astley's, where I observed her stop suddenly, and toss her arms in the air with a gesture of desperation. I quickened my steps, which she observing, uttered a slight scream, and darted swiftly off again, moaning and sobbing as she ran. The slight momentary glimpse I had obtained of her features beneath the gas-lamp opposite Astley's, suggested a frightful apprehension, and I followed at my utmost speed. She turned at the first cross-street, and I should soon have overtaken her, but that in darting round the corner where she disappeared, I ran full butt against a stout, elderly gentleman, who was hurrying smartly along out of the weather. What with the suddenness of the shock and the slipperiness of the pavement, down we both reeled; and by the time we had regained our feet, and growled savagely at each other, the young woman, whoever she was, had disappeared, and more than half an hour's eager search after her proved fruitless. At last I bethought me of hiding at one corner of Westminster Bridge. I had watched impatiently for about twenty minutes, when I observed the object of my pursuit stealing timidly and furtively towards the bridge on the opposite side of the way. As she came nearly abreast of where I stood, I darted forward; she saw, without recognising me, and uttering an exclamation of terror, flew down towards the river, where a number of pieces of balk and other timber were fastened together, forming a kind of loose raft. I followed with desperate haste, for I saw that it was indeed Mary Kingsford, and loudly calling to her by name to stop. She did not appear to hear me, and in a few moments the unhappy girl had gained the end of the timber-raft. One instant she paused with clasped hands upon the brink, and in another had thrown herself into the dark and moaning river. On reaching the spot where she had disappeared, I could not at first see her in consequence of the dark mourning dress she had on. Presently I caught sight of her, still upborne by her spread clothes, but already carried by the swift current beyond my reach. The only chance was to crawl along a piece of round timber which projected farther into the river, and by the end of which she must pass. This I effected with some difficulty; and laying myself out at full length, vainly endeavoured, with outstretched, straining arms, to grasp her dress. There was nothing left for it but to plunge in after her. I will confess that I hesitated to do so. I was encumbered with a heavy dress, which there was no time to put off, and moreover, like most inland men, I was but an indifferent swimmer. My indecision quickly vanished. The wretched girl, though gradually sinking, had not yet uttered a cry, or appeared to struggle; but when the chilling waters reached her lips, she seemed to suddenly revive to a consciousness of the horror of her fate: she fought wildly with the engulfing tide, and shrieked piteously for help. Before one could count ten, I had grasped her by the arm, and lifted her head above the surface of the river. As I did so, I felt as if suddenly encased and weighed down by leaden garments, so quickly had my thick clothing and high boots sucked in the water. Vainly, thus burdened and impeded, did I endeavour to regain the raft; the strong tide bore us outwards, and I glared round, in inexpressible dismay, for some means of extrication from the frightful peril in which I found myself involved. Happily, right in the direction the tide was

drifting us, a large barge lay moored by a chain-cable. Eagerly I seized and twined one arm firmly round it, and thus partially secure, hallooed with renewed power for assistance. It soon came: a passer-by had witnessed the flight of the girl and my pursuit, and was already hastening with others to our assistance. A wherry was unmoved: guided by my voice, they soon reached us; and but a brief interval elapsed before we were safely housed in an adjoining tavern.

A change of dress, with which the landlord kindly supplied me, a blazing fire, and a couple of glasses of hot brandy and water, soon restored warmth and vigour to my chilled and partially-benumbed limbs; but more than two hours elapsed before Mary, who had swallowed a good deal of water, was in a condition to be removed. I had just sent for a cab, when two police-officers, well known to me, entered the room with official briskness. Mary screamed, staggered towards me, and clinging to my arm, besought me with frantic earnestness to save her.

'What is the meaning of this?' I exclaimed, addressing one of the police-officers.

'Merely,' said he, 'that the young woman that's clinging so tight to you has been committing an audacious robbery.'

'No—no—no!' broke in the terrified girl.

'Oh! of course you'll say so,' continued the officer. 'All I know is, that the diamond brooch was found snugly hid away in her own box. But come, we have been after you for the last three hours; so you had better come along at once.'

'Save me!—save me!' sobbed poor Mary, as she tightened her grasp upon my arm and looked with beseeching agony in my face.

'Be comforted,' I whispered; 'you shall go home with me. Calm yourself, Miss Kingsford,' I added in a louder tone: 'I no more believe you have stolen a diamond brooch than that I have.'

'Bless you!—bless you!' she gasped in the intervals of her convulsive sobs.

'There is some wretched misapprehension in this business, I am quite sure,' I continued; 'but at all events I shall bail her—for this night at least.'

'Bail her! That is hardly regular.'

'No; but you will tell the superintendent that Mary Kingsford is in my custody, and that I answer for her appearance to-morrow.'

The men hesitated, but I stood too well at headquarters for them to do more than hesitate; and the cab I had ordered being just then announced, I passed with Mary out of the room as quickly as I could, for I feared her senses were again leaving her. The air revived her somewhat, and I lifted her into the cab, placing myself beside her. She appeared to listen in fearful doubt whether I should be allowed to take her with me; and it was not till the wheels had made a score of revolutions that her fears vanished; then throwing herself upon my neck in an ecstasy of gratitude, she burst into a flood of tears, and continued till we reached home sobbing on my bosom like a broken-hearted child. She had, I found, been there about ten o'clock to seek me, and being told that I was gone to Astley's, had started off to find me there.

Mary still slept, or at least she had not risen, when I left home the following morning to endeavour to get at the bottom of the strange accusation preferred against her. I first saw the superintendent, who, after hearing what I had to say, quite approved of all that I had done, and intrusted the case entirely to my care. I next saw Mr and Mrs Morris and Sophia Clarke, and then waited upon the prosecutor, a youngish gentleman of the name of Saville, lodging in Essex Street, Strand. One or two things I heard necessitated a visit to other officers of police, incidentally, as I found, mixed up with the affair. By the time all this was done, and an effectual watch had been placed upon Mr Augustus

Saville's movements, evening had fallen, and I wended my way homewards, both to obtain a little rest, and hear Mary Kingsford's version of the strange story.

The result of my inquiries may be thus briefly summed up. Ten days before, Sophia Clarke told her cousin that she had orders for Covent-Garden Theatre; and as it was not one of their busy nights, she thought they might obtain leave to go. Mary expressed her doubt of this, as both Mr and Mrs Morris, who were strict, and somewhat fanatical Dissenters, disapproved of playgoing, especially for young women. Nevertheless Sophia asked, informed Mary that the required permission had been readily accorded, and off they went in high spirits; Mary especially, who had never been to a theatre in her life before. When there they were joined by Hartley and Simpson, much to Mary's annoyance and vexation, especially as she saw that her cousin expected them. She had, in fact, accepted the orders from them. At the conclusion of the entertainments, they all four came out together, when suddenly there arose a hustling and confusion, accompanied with loud outcries, and a violent swaying to and fro of the crowd. The disturbance was, however, soon quelled; and Mary and her cousin had reached the outer door, when two police-officers seized Hartley and his friend, and insisted upon their going with them. A scuffle ensued; but other officers being at hand, the two men were secured, and carried off. The cousins, terribly frightened, called a coach, and were very glad to find themselves safe at home again. And now it came out that Mr and Mrs Morris had been told that they were going to spend the evening at my house, and had no idea they were going to the play! Vexed as Mary was at the deception, she was too kindly-tempered to refuse to keep her cousin's secret; especially knowing as she did that the discovery of the deceit Sophia had practised would in all probability be followed by her immediate discharge. Hartley and his friend swaggered on the following afternoon into the shop, and whispered Sophia that their arrest by the police had arisen from a strange mistake, for which the most ample apologies had been offered and accepted. After this matters went on as usual, except that Mary perceived a growing insolence and familiarity in Hartley's manner towards her. His language was frequently quite unintelligible, and once he asked her plainly 'if she did not mean that he should go shares in the prize she had lately found?' Upon Mary replying that she did not comprehend him, his look became absolutely ferocious, and he exclaimed: 'Oh, that's your game, is it? But don't try it on with me, my good girl, I advise you.' So violent did he become, that Mr Morris was attracted by the noise, and ultimately bundled him, neck and heels, out of the shop. She had not seen either him or his companion since.

On the evening of the previous day, a gentleman whom she never remembered to have seen before, entered the shop, took a seat, and helped himself to a tart. She observed that after a while he looked at her very earnestly, and at length approaching quite close, said, 'You were at Covent-Garden Theatre last Tuesday evening week?' Mary was struck, as she said, all of a heap, for both Mr and Mrs Morris were in the shop, and heard the question.

'Oh no, no! you mistake,' she said hurriedly, and feeling at the same time her cheeks kindle into flame.

'Nay, but you were though,' rejoined the gentleman. And then lowering his voice to a whisper, he said, 'And let me advise you, if you would avoid exposure and condign punishment, to restore me the diamond brooch you robbed me of on that evening.'

Mary screamed with terror, and a regular scene ensued. She was obliged to confess she had told a falsehood in denying she was at the theatre on the night in question, and Mr Morris after that seemed inclined to believe anything of her. The gentleman persisted in

his charge; but at the same time vehemently iterating his assurance that all he wanted was his property; and it was ultimately decided that Mary's boxes, as well as her person, should be searched. This was done; and to her utter consternation the brooch was found concealed, they said, in a black-silk reticule. Denials, asseverations, were vain. Mr Saville identified the brooch, but once more offered to be content with its restoration. This Mr Morris, a just, stern man, would not consent to, and he went out to summon a police-officer. Before he returned, Mary, by the advice of both her cousin and Mrs Morris, had fled the house, and hurried in a state of distraction to find me, with what result the reader already knows.

'It is a wretched business,' I observed to my wife, as soon as Mary Kingsford had retired to rest, at about nine o'clock in the evening. 'Like you, I have no doubt of the poor girl's perfect innocence; but how to establish it by satisfactory evidence is another matter. I must take her to Bow Street the day after to-morrow.'

'Good God, how dreadful! Can nothing be done? What does the prosecutor say the brooch is worth?'

'His uncle,' he says, 'gave a hundred and twenty guineas for it. But that signifies little; for were its worth only a hundred and twenty farthings, compromise is, you know, out of the question.'

'I did not mean that. Can you shew it me? I am a pretty good judge of the value of jewels.'

'Yes, you can see it.' I took it out of the desk in which I had locked it up, and placed it before her. It was a splendid emerald, encircled by large brilliants.

My wife twisted and turned it about, holding it in all sorts of lights, and at last said—'I do not believe that either the emerald or the brilliants are real—that the brooch is, in fact, worth twenty shillings intrinsically.'

'Do you say so?' I exclaimed as I jumped up from my chair, for my wife's words gave colour and consistency to a dim and faint suspicion which had crossed my mind. 'Then this Saville is a manifest liar; and perhaps confederate with—— But give me my hat: I will ascertain this point at once.'

I hurried to a jeweller's shop, and found that my wife's opinion was correct: apart from the workmanship, which was very fine, the brooch was valueless. Conjectures, suspicions, hopes, fears, chased each other with bewildering rapidity through my brain; and in order to collect and arrange my thoughts, I stepped out of the whirl of the streets into Dolly's Chop-house, and decided, over a quiet glass of negus, upon my plan of operations.

The next morning there appeared at the top of the second column of the 'Times' an earnest appeal, worded with careful obscurity, so that only the person to whom it was addressed should easily understand it, to the individual who had lost or been robbed of a false stone and brilliants at the theatre, to communicate with a certain person—whose address I gave—without delay, in order to save the reputation, perhaps the life, of an innocent person.

I was at the address I had given by nine o'clock. Several hours passed without bringing any one, and I was beginning to despair, when a gentleman of the name of Bagshawe was announced: I fairly leaped for joy, for this was beyond my hopes.

A gentleman presently entered, of about thirty years of age, of a distinguished, though somewhat dissipated aspect.

'This brooch is yours?' said I, exhibiting it without delay or preface.

'It is; and I am here to know what your singular advertisement means?'

I briefly explained the situation of affairs.

'The rascals!' he broke in almost before I had finished: 'I will briefly explain it all. A fellow of the name of Hartley, at least that was the name he gave,

robbed me, I was pretty sure, of this brooch. I pointed him out to the police, and he was taken into custody; but nothing being found upon him, he was discharged.'

'Not entirely, Mr Bagshawe, on that account. You refused, when arrived at the station-house, to state what you had been robbed of; and you, moreover, said, in presence of the culprit, that you were to embark with your regiment for India the next day. That regiment, I have ascertained, did embark, as you said it would.'

'True; but I had leave of absence, and shall take the Overland route. The truth is, that during the walk to the station-house, I had leisure to reflect that if I made a formal charge, it would lead to awkward disclosures. This brooch is an imitation of one presented me by a valued relative. Losses at play—since, for this unfortunate young woman's sake, I must out with it—obliged me to part with the original; and I wore this, in order to conceal the fact from my relative's knowledge.'

'This will, sir,' I replied, 'prove, with a little management, quite sufficient for all purposes. You have no objection to accompany me to the superintendent?'

'Not in the least: only I wish the devil had the brooch as well as the fellow that stole it.'

About half-past five o'clock on the same evening, the street door was quietly opened by the landlord of the house in which Mr Saville lodged, and I walked into the front room on the first floor, where I found the gentleman I sought languidly reclining on a sofa. He gathered himself smartly up at my appearance, and looked keenly in my face. He did not appear to like what he read there.

'I did not expect to see you to-day,' he said at last.

'No, perhaps not: but I have news for you. Mr Bagshawe, the owner of the hundred-and-twenty guinea brooch your deceased uncle gave you, did not sail for India, and—'

The wretched cur, before I could conclude, was on his knees begging for mercy with disgusting abjectness. I could have spurned the scoundrel where he crawled.

'Come, sir!' I cried, 'let us have no snivelling or humbug: mercy is not in my power, as you ought to know. Strive to deserve it. We want Hartley and Simpson, and cannot find them: you must aid us.'

'Oh yes; to be sure I will!' eagerly rejoined the rascal. 'I will go for them at once,' he added with a kind of hesitating assurance.

'Nonsense! Send for them, you mean. Do so, and I will wait their arrival.'

His note was despatched by a sure hand; and meanwhile I arranged the details of the expected meeting. I, and a friend, whom I momentarily expected, would ensconce ourselves behind a large screen in the room, whilst Mr Augustus Saville would run playfully over the charming plot with his two friends, so that we might be able to fully appreciate its merits. Mr Saville agreed. I rang the bell, an officer appeared, and we took our posts in readiness. We had scarcely done so, when the street-bell rang, and Saville announced the arrival of his confederates. There was a twinkle in the fellow's green eyes which I thought I understood. 'Do not try that on, Mr Augustus Saville,' I quietly remarked: 'we are but two here certainly, but there are half-a-dozen in waiting below.'

No more was said, and in another minute the friends met. It was a boisterously-jolly meeting, as far as shaking hands and mutual felicitations on each other's good looks and health went. Saville was, I thought, the most obstreperously gay of all three.

'And yet now I look at you, Saville, closely,' said Hartley, 'you don't look quite the thing. Have you seen a ghost?'

'No; but this cursed brooch affair worries me.'

'Nonsense!—humbug!—it's all right: we are all embarked in the same boat. It's a regular three-

handed game. I priggid it; Simmy here whipped it into pretty Mary's reticule, which she, I suppose, never looked into till the row came; and you claimed it—a regular merry-go-round, aint it, eh? Ha! ha! ha!—Ha!

'Quite so, Mr Hartley,' said I, suddenly facing him, and at the same time stamping on the floor; 'as you say, a delightful merry-go-round; and here, you perceive,' I added, as the officers crowded into the room, 'are more gentlemen to join in it.'

I must not stain the paper with the curses, imprecations, blasphemies, which for a brief space resounded through the apartment. The rascals were safely and separately locked up a quarter of an hour afterwards; and before a month had passed away, all three were transported. It is scarcely necessary to remark, that they believed the brooch to be genuine, and of great value.

Mary Kingsford did not need to return to her employ. Westlake the elder withdrew his veto upon his son's choice, and the wedding was celebrated in the following May with great rejoicing; Mary's old playmate officiating as bridesmaid, and I as bride's-father. The still young couple have now a rather numerous family, and a home blessed with affection, peace, and competence. It was some time, however, before Mary recovered from the shock of her London adventure; and I am pretty sure that the disagreeable reminiscences inseparably connected in her mind with the metropolis will prevent at least one person from being present at the World's Great Fair.

JOHNSTON'S TOUR IN AMERICA.

PROFESSOR JOHNSTON, well known for his acquirements as a lecturer on agricultural chemistry and geology, has just given to the world the result of his observations during a recent excursion in North America, which he visited under authoritative auspices.* The work so composed, bearing reference chiefly to the agricultural qualities of the districts visited, will not be expected to resemble ordinary works of travel, nor to consist of what is called amusing reading; nevertheless, the writer, by the originality of his views, has produced a work of no small interest, certainly one which presents much useful information not only to the general reader, but to the intending agricultural emigrant.

Among the Americans themselves, whether settlers in the British possessions or in the United States, Mr Johnston's account of their country ought to awaken deep and anxious attention. Travelling from place to place in the constant investigation of the geological structure of the country—the nature of soils depending more or less on that structure—and also bringing his experience to bear on circumstances of a political and social nature, he is enabled to present a true picture of American husbandry as it presently exists, and to sugar from appearances its prospective condition. The explorations of the author were confined principally to New Brunswick, the western part of the state of New York, and certain districts of Canada, where settlers are still busied in the excavation of farms from the primeval forest. In making his examinations, Mr Johnston appears to have borne in mind the controversy still raging in England respecting the free import of foreign corn; and it was a special object with him to learn, from personal observation, how far the British farmer had reason to be alarmed with the

progress of a rival agriculture beyond the Atlantic. On this subject, therefore, the book before us may possibly do some useful service. Referring our readers to the work itself as a mine of valuable truths on this prevailing topic, we can hope only to glance at a few of the author's more pointed remarks. According to him, there is no likelihood of the price of British produce being permanently depressed by the free importation of American wheat and flour. For a time there will be a certain though not great import, but by and by it will fall down to a point scarcely worth speaking of. Vast as are the wheat-producing regions of America, they are not inexhaustible; nor are they greater than the native demands will continue to warrant. What the broad American continent will be, when its surface is subjected to skill, capital, and labour, like the highly-titled lands of Norfolk, is not matter of immediate concern. At present, but one principle of farming, with trifling exceptions, prevails. This consists in exhausting the natural soil with a scourging succession of grain crops; then deserting the land, and going on to fresh territories, which are exhausted and deserted in turn. Nothing like proper restorative culture is known, and never will be till the enterprise of the settler is stopped in its western progress by the Rocky Mountains or the Pacific. In short, it is cheaper to buy new land than to manure the old; and only when there is no more fresh land to purchase, will the art of farming in America be properly known and practised.

Speaking of a fertile part of New Brunswick which he visited, Mr Johnston observes, that 'in clearing land in this district, it is calculated that the first three crops, which are merely harrowed in, will pay all the expense of cutting the timber, burning, and cultivating. If the settler then abandon it, he is no loser: everything he cuts off it afterwards is gain, or any sum for which he can sell his cleared land. This is a great inducement to the exhausting system, which clears annually new land for grain, cuts for hay all which the old cropped land will yield, till it is again overrun with a young growth of wood, and neither saves, collects, nor values manure.' Of this system he goes on to say, 'it is barbarous, reprehensible, and wasteful to the country—and yet it is probably the method which yields a ready sustenance to the settler's family at the smallest expense of mental and bodily labour. Our condemnation of the pioneers of civilisation in a new country ought not, therefore, to be severe or indiscriminate. With all our skill, we English farmers and teachers of agricultural science should, in the same circumstances, probably do just the same, so long as land was plenty, labour scarce and dear, markets few and distant, and prices of produce low. As population increases, a higher class will come in; will purchase the exhausted farms; and by their skill and manure will obtain from the soil new returns as large, and perhaps as profitable, as those which rewarded the men who first penetrated the bush.'

In New Brunswick it is not an unusual practice for settlers to rent instead of buying lands. They pay of annual rent from 6s. to 9s. per acre for farms, without being under any obligation as to routine of cropping. The plan is ruinous to the land, but works admirably for the farmer. 'He takes the cream off the land, and leaves it; and as tenants are in request, he can easily shift to another farm, or can take any good opportunity which may present itself of buying land for himself.'

Earnest industry will, in New Brunswick as elsewhere, meet with its reward; farming is profitable to a man with a grown-up family to assist him; but in the midst of prosperity there are serious discomforts

* Notes on North America, Agricultural, Economical, and Social. By James F. W. Johnston. 2 vols. Blackwood and Sons. 1855.

and drawbacks; at least we should think them so. Insects are a terrible affliction. One day Mr Johnston saw a farmer toiling in the fields with what seemed a smoking quiver at his back. On a nearer inspection, the supposed quiver was seen to be a roll of cedar bark suspended from the shoulders, and lighted at one end, so that the smoke might float about the head of the wearer, and keep off the flies. In another place, he observed 'fires kindled in the open air for the benefit of the cattle, which are happy to come in the evening and hold their heads in the smoke, with a view of escaping to some extent their tormentors. As the country becomes cleared, the flies may be expected to diminish.'

Latterly, with the view of opening up lines of thoroughfare through the forests, the legislature of New Brunswick has made an offer which will suit the convenience of those who have not money to buy, or even to rent land. A certain section for settlement is divided into lots of eighty acres each. Any person may get a grant of one of these lots on payment of no more than 1s. per acre, to defray the expense of the grant and survey; at the same time engaging to give labour on the roads, at a fixed price per rood, to the amount of L.12—thus making the entire price of his land L.16. This sum, however, is in currency: in money sterling, the amount is about one-fourth less. In speaking of this advantageous opening for settlers with limited means, Mr Johnston mentions—'That a body of emigrants arriving in June would be able to open the road, cut down four acres on each of these lots for crops on the following spring, and build a log-house before the winter sets in. Of course they must have means to maintain themselves and families during the winter, and until the crops on their new lands are ripe. Bodies of emigrants from the same county or neighbourhood, going out as a single party, would work pleasantly together, and be good company and agreeable neighbours to each other.' Before starting, it must be recollected that the winter of New Brunswick is very severe; and that, during this season, little or no outdoor labour can be performed. Old settlers, however, seem to relish these hard winters, which are by no means unpleasant or unhealthy—they are only economically troublesome.

Nowhere do men with large capital engage in agricultural operations, because 7 per cent. can be obtained for money on mortgage; and it is more profitable, besides being more pleasant, to lend capital than to employ it in husbandry. This circumstance alone must long operate detrimentally on American farming. We are told that 'tillage farms are cultivated by persons who do not usually possess more than L.1 per acre of capital.' American farming, indeed, seems to be little better than the labour of a peasant, undirected by science, and almost unaided by machinery. 'The land itself, and the labour of their families, is nearly all the capital which most of the farmers possess. And if any of them save a hundred dollars, they generally prefer to lend it on mortgage at high interest, or to embark it in some other pursuit which they think will pay better than farming, than to lay it out in bettering their farms, or in establishing a more generous husbandry.'

Proceeding from Nova Scotia through New Brunswick to New York, and thence to the Genesee country near Lake Ontario, one of the finest wheat-producing districts in the States, the author there has similar observations to make. This fertile western region is pretty well cultivated, and yields large crops; yet such is the growth of population in New York, that there is no surplus of wheat for exportation. Production, in fact, does not keep pace here with the native demand for food, and there is a regular import from Canada, although under a restrictive duty of 20 per cent. No doubt the demand will urge forward improved methods of culture;

but 'even when such better agricultural times arrive in this region, the English farmer will still, in my opinion, have little to fear from this quarter of the American continent.'

Through this western part of the State of New York pours a ceaseless stream of emigration. Every day railway cars and canal boats are seen travelling along westward, with vast numbers of men, women, and children, of all ages, and of various European countries—Irish, English, Scotch, and Germans; the Irish usually outnumbering all the others. Comparatively few stop in Canada, where the colonial office has contrived to make the terms of purchasing land almost unintelligible. On they go, like a stream of people bound for a fair; and they know no rest till they find a home in Michigan, or some other State in the Far West. The breaking up of these western lands beyond the lakes has, within a recent period, turned the tide of import and export of bread-stuffs. In 1838, flour was shipped from 'Buffalo on Lake Erie for the west; and the wheat-region of New York, with that of Upper Canada, were the main sources of its supply. Now, after only twelve years, an enormous supply of wheat and flour is brought from the West, along Lake Erie.' In 1849, the wheat and flour thus arriving at Buffalo amounted to 250,000 tons, valued at ten millions of dollars—a large sum to be produced by the scraping industry of emigrant settlers, with little or no money capital.

After examining the western districts geologically, Mr Johnston comes to the conclusion, that much of the soil is not of first-rate quality naturally; and that its productiveness is to be ascribed principally to its freshness. The reckless draughting of corn crops will inevitably bring out its true character. Meanwhile, nearly the whole population being employed in agricultural pursuits, the produce is considerable. But, observes our author, 'a question of great importance to the British and New England wheat-growers here suggests itself—Will the large export of wheat from these new states continue to increase, or are there any reasons why it should by and by begin to decrease? So far as I have been able to collect information bearing upon this question, I am decidedly of opinion that, though the quantity of wheat and flour exported from these north-western states may continue to increase for a certain limited number of years, it will by and by begin to diminish, and will finally, in a great measure, cease.'

Considerable tracts of land appear to be best adapted, in point of soil and climate, for Indian corn—an article, however, for which there is comparatively little foreign demand. On this account it is employed in feeding hogs; and the *hog crop*, therefore, is an important element in the calculations of the settler. Missouri, Tennessee, Kentucky, Illinois, Indiana, and Ohio, are the principal hog-producing states. There the swine 'are allowed to run in the woods, and feed on the acorns, till five or six weeks before killing-time; and are then turned into the Indian corn-fields to fatten them, and harden their flesh.' In 1846 there were killed in the above states, with some other places, as many as 1,087,862 hogs. A great trade has correspondingly sprung up at Cincinnati in the salting and packing of pork, the manufacture of lard, lard-oil, stearine, and other articles. In other port towns on the great rivers, the same kind of trade is attaining importance. The number of hogs in the whole United States is estimated at upwards of forty millions. Lard-oil, rivalling that from the olive, is beginning to be exported in large quantities to England, where it answers the purpose of the best lamp oils, at a considerably lower price. Few things are more surprising than the large export of grain, pork, and other articles, from places which, twenty years ago or less, had no name on the map. For example, there is in the state of Wisconsin, on Lake Michigan, a place called Milwaukee, which,

though starting into existence only fifteen years ago, now numbers 16,000 inhabitants, and is the centre of a thriving neighbourhood. It is calculated that the arrival of emigrants adds every year to the state in which they settle, capital to the extent of £1,000,000, which is reckoning the produce of the labour of each at only £5. Referring to this fact, Mr Johnston justly remarks, that 'it is Europe, not America, that is the cause of the rapid growth of the United States—European capital, European hands, and European energy. If all the native-born Americans—not being the sons or grandsons of Europeans—were to sit down and fold their hands and go to sleep, the progress of the country would scarcely be a whit less rapid so long as peace between America and Europe is maintained.' It might be added, that the loss in population and wealth to Great Britain by the stream of emigration going past the colonies is only a natural consequence of a settlement on lands being rendered more available in the States. It is remarked, as a circumstance not a little curious, that whether the emigrant settlers in the new western states be English, Irish, Scotch, or German, the aggregate character shortly assumes the American type. This strange result is, it seems, owing to the busy interference of New Englanders, who, intruding themselves on the new settlements, do the *thinking*, while the foreign immigrants confine themselves to the more humble *working* departments of the social economy. 'The emigrants,' observes Mr Johnston, 'who go out from Europe—the raw bricks for the new state buildings—are generally poor, and for the most part indifferently educated. Being strangers to the institutions of the country, and to their mode of working, and, above all, being occupied in establishing themselves, the rural settlers have little leisure or inclination to meddle with the direct regulation of public affairs for some years after they have first begun to hew their farms out of the solitary wilderness. The New Englanders come in to do this. The west is an outlet for their superfluous lawyers, their doctors, their ministers of various persuasions, their newspaper editors, their bankers, their merchants, and their pedlars. All the professions and influential positions are filled up by them. They are the movers in all the public measures that are taken in the organisation of state governments, and the establishment of county institutions; and they occupy most of the legislative, executive, and other official situations, by means of which the state affairs are at first carried on. Thus the west presents an inviting field to the ambitious spirits of the east; and through their means the genius and institutions of the New England states are transplanted and diffused, and determine in a great measure those of the more westerly portions of the Union.' No kind of handy occupation at which a penny can be turned comes amiss to these New Englanders. An acquaintance of the author, who had business which took him frequently into Georgia, related the following anecdote in illustration of this versatility of talent:—'When on his way to Boston, on one occasion, with a friend, who had also been with him in Georgia, they dined at a hotel, where they saw opposite to them at table two New Englanders, whom they had last seen peddling in Georgia. "Well," says his friend to one of them, "when did you quit your peddling in Georgia?" The questioned made no reply, but swallowing his dinner expeditiously, as a New Englander can, he went out of the room, and waiting for my friend and his companion, accosted them with, "For any sake say nothing about the peddling. We have been up to Maine, and as our wares were out, we took to the lecturing. It's not a bad trade; we have made sixteen dollars a day since we began. I take astronomy, and he does the phrenology. We have been lecturing in Bangor, and we have promised to go back. We had an invitation to go down to Bucksport, but we heard of some people there who knew quite as much as our-

selves, so we declined. Now, you won't say anything about the peddling!"'

To proceed with the observations of the writer on the subject of his inquiries: he looks more hopefully on the progress of Canada in material prosperity than other tourists have been inclined to do. Arriving at Kingston, he attended a show of stock and agricultural implements, got up under the auspices of a local society: it was not so extensive or so crowded as one which he previously attended at Syracuse, state of New York; but this was 'more numerously attended by well-dressed and well-behaved people, and rendered attractive by a greater quantity of excellent stock and implements than he had at all anticipated.' A repetition of the remark here occurs respecting the method of cropping lands, which is rapidly deteriorating the soil. In one place mentioned, 'wheat has been taken from the land for fifty years in succession.' Diminishing and precarious crops are the consequence. Latterly, the crop of wheat on these exhausted and ill-used lands has suffered from diseases incidental to plants of weakly growth. Occasionally the crop entirely fails, and the farmer finds to his cost that nature is not to be outraged with impunity. Still, few think of restoratives. A usual plan is to change the crop; and potatoes, peas, and oats are therefore coming more into use. Already Lower Canada, and some other old settled parts, are under the necessity of importing wheat; and, says Mr Johnston very emphatically, 'the same consummation is preparing for the more newly-settled parts, unless a change of system take place. The new wheat-exporting—so called—granary districts and states will by and by gradually lessen in number and extent, and probably lose altogether the ability to export, unless when unusual harvests occur. And if the population of North America continue to advance at its present rapid rate—especially in the older states of the Union—if large mining and manufacturing populations spring up, the ability to export wheat to Europe will lessen still more rapidly. This diminution may be delayed for a time by the rapid settling of new western states, which from their virgin soils will draw easy returns of grain; but every step westward adds to the cost of transporting produce to the Atlantic border, while it brings it nearer to that far western California, which, as some predict, will in a few years afford an ample market for all the corn and cattle which the western states can send it.' He adds, 'in their relation to English markets, therefore, and the prospects and profits of the British farmer, my persuasion is, that, year by year, our transatlantic cousins will become less and less able—except in extraordinary seasons—to send large supplies of wheat to our island ports; and that, when the virgin freshness shall have been rubbed off their new lands, they will be unable, with their present knowledge and methods, to send wheat to the British market so cheap as the more skilful farmers of Great Britain and Ireland can do. If any one less familiar with practical agriculture doubts that such must be the final effect of the exhausting system now followed on all the lands of North America, I need only inform him that the celebrated Lothian farmers, in the immediate neighbourhood of Edinburgh, who carry all their crops off the land—as the North American farmers now do—return, on an average, ten tons of well-rotted manure every year to every acre, while the American farmer returns nothing. If the Edinburgh farmer finds this quantity necessary to keep his land in condition, that of the American farmer must go out of condition, and produce inferior crops in a time which will bear a relation to the original richness of the soil, and to the weight of crop it has been in the habit of producing. And when this exhaustion has come, a more costly system of generous husbandry must be introduced, if the crops are to be kept up; and in this more generous system my belief is that the British

farmers will have the victory.' Surely the agricultural interest will thank this acute and intelligent author for the comforting reflections which in these few words are gratefully inspired.

GLASGOW IN THE LAST CENTURY.

THIRD ARTICLE.

[BEFORE allowing our veteran contributor to proceed with his reminiscences, we may include a little anecdote of the celebrated Francis Hutcheson, who, it will be recollected, laid the foundations of what has been called the Scotch school of metaphysics, while professor of moral philosophy in the Glasgow University. Hutcheson, who, by the way, came from Ireland, was a man of commanding figure and energetic movements, and altogether of a different cast from the usual quiet and somewhat hum-drum materials of a Scotch professor of those days. It also appears that some of his doctrines were not less discrepant with those which had been accustomed to nestle in such sheltered nooks of thought. There was an examination of the divinity class one day, conducted by the little, tame, old-fashioned professor of that faculty; Hutcheson swept backwards and forwards in his long gown through the hall; and some other professors were in attendance. A youth, having stated something that did not sound quite accordant with old use and wont in the ears of his theological instructor, was stopped and interrogated. 'Sic docet Franciscus Hutchesonus' ('So does Professor Hutcheson teach'), said the student. The Irish metaphysician immediately stopped, and exclaimed in a powerful voice—'Sic doceo, et id defendebo' ('Yes, that I teach, and that I will defend.') The poor little professor shrunk under his eagle glance, saying, 'Weel, weel,' and went on in the examination without farther comment.]

Dr Macleod, professor of church history—an original in his way—had given up teaching his class when I went to college, his increasing infirmities having made it necessary for him to get an assistant. He was a little, old, crabbed-looking man, wearing a round wig and small cocked-hat—the very picture of ill-nature and peevishness, probably the result of bad health. His assistant meeting him one day in the college court, said—'I am glad to see you looking so well, sir.' 'No, sir; you are not glad to see me looking well!' was the cynical reply. The doctor, an old Highlander, had the peculiar intonation of the far north in reading or speaking. He was a great admirer of Sterne, and particularly of Yorick's celebrated sermon on the text—'It is better to go to the house of mourning than to the house of feasting,' beginning with, 'That I deny,' &c. Dr Macleod, in imitation of his model, preaching once from the text—'The fool hath said in his heart there is no God!' commenced—'And a very great fool he was!' but from the peculiar tone of voice and appearance of the speaker, the effect on the audience was anything but sublime.

Dr Macleod, before he received his appointment as professor in Glasgow College, had been an usher at Eton, where King George III. got acquainted with him in his walks, and was much amused with his singularities. When any one from Glasgow was presented to the king, it is said that he always asked after 'old Macleod.'

Dr Findlay, long professor of divinity in the university, who died at the age of ninety-seven or ninety-eight, and taught his class till within two years of his death, was still on the field when I was at college, and had all the appearance of a vigorous old age. He wore a bushy wig and cocked-hat, like Dr Macleod; and, like him, was a little man in point of stature, but would have made two of him in bulk. Well do I recollect the cheerful smile which played on his features as he came stumping through the court, and returned the salu-

tations which were readily given him by the younger students. Like many men who have attained to great longevity, he was a very early riser in the morning; and at a very advanced period of life has been heard to complain that old age was getting the better of him, as, instead of getting up at six o'clock in the winter mornings, he had fallen into the bad habit of lying till seven. Dr Findlay was considered a very learned man; but his printed works were calculated for the few, not the million. Hence they sometimes experienced the fate of being sent '*in vicem vendentem thus et odore.*' A worthy tobacconist in the High Street was complaining one day of a certain work of the doctor's being a very bad book. 'How?' said his friend; 'I always thought Dr Findlay had been a worthy, good man.' 'It's the warst book I ken,' said the shopkeeper: 'it's oure big for a pennyworth o' snuff—and it's no big enough for three bawbees' worth!'

Dr Reid was a little before my time, but, as might have been expected of so celebrated a character, several anecdotes respecting him still lingered in Alma. The readers of Professor Dugald Stewart's very interesting memoir of Reid will recollect that the latter had married a cousin of his own—'Aberdeenawa' as well as himself. This good lady had got up on a chair or table one day in order to dust an engraving; but as the attitude did not appear to the moralist to be very becoming, he was expressing his opinion to his spouse in terms more plain than pleasant. The lady heard him for an instant; but as the doctor seemed to be encroaching on a province which did not belong to him, she interrupted him with, 'Fu's the meen the day, doctor? fu's the meen?' ('How is the moon?') Stewart says that Dr Reid, at the age of fifty-five, attended the lectures of Black with a juvenile curiosity and enthusiasm. The following anecdote will shew that the principle of curiosity was not quenched in this good man at a much later period of life. When the famous Dr Graham was in Glasgow, his lectures—which, as is well known, were far from decorous—were once or twice honoured by the attendance of Dr Reid. A friend expressing his surprise on meeting the professor of moral philosophy at such a place, the doctor, now a very old man, good-humouredly replied: 'Why it is only such as I that should be seen in such a place!'

When Dr Parr visited Glasgow many years since, one of the first places that he requested he might be taken to was Dr Reid's grave in the cathedral burying-ground. A young student of divinity, who accompanied Dr Parr, stated, that when the grave was shewn to him, he seemed to be lost in thought for a few minutes. At last he said, 'A great man, sir!—a very great man!' High praise from an English divine. Scotch metaphysics were never very popular at the English universities.

When I commenced my academical curriculum, the most eminent man of the circle which I have been describing was John Millar, the professor of law. His lectures were attended by students from all quarters, and I never heard any of them speak of him but in terms of unqualified admiration.

Mr Millar, like the other professors, was accustomed to have a certain number of boarders in his house, several of them men of high rank, who were afterwards to make a figure in life. Among other pupils at this time were the late Lord Melbourne, and his brother the Honourable Mr Lamb. With these young men Mr Millar's deportment was exceedingly engaging. He was accustomed, in conversation with them, to start a variety of topics, literary or otherwise, for the purpose of eliciting their sentiments; and he then, in a simple and familiar manner, stated his own opinions, which, proceeding from a mind like his, richly stored with the treasures of antiquity, as well as thoroughly versant with contemporary history, must have been deeply interesting. Mr Millar, it is well known, was a steady

Whig; and at a time when party spirit ran very high in Glasgow, this was sufficient to exclude him from the general society of the city, the bias of which was decidedly Tory. When he did mix in convivial parties, his affable, pleasant manners, and flow of anecdote, made him a favourite for the moment with many who were ready to do battle with him for his politics.

Mr Millar had a strong, athletic frame of body; and it was said that he did not disdain to take lessons in *sparring* from Mendoza, then the great master of the 'noble science of self-defence.' Mendoza was a *protégé* of Douglas, Duke of Hamilton; and it must be recollected that the science was then infinitely more cultivated by the higher ranks of society than in these degenerate days. Mr Millar had a natural flow of wit, and sometimes condescended to make use of a pun. A late professor told me, that at the Literary Society one evening a learned Hebrew scholar delivered some observations on the book of Job, which, contrary to the approved method, he pronounced as if the letter *o* were short. When the reader commenced, Millar, turning to his neighbour, said, loud enough to be heard, 'I knew he would make a *job* of it.'

Mr Richardson, professor of humanity, was as different from Mr Millar in his exterior appearance as he was in his politics. He was originally intended for the church, but the situation of tutor to Lord Cathcart's two sons having been offered to him, he accepted this employment; and when his lordship was appointed ambassador to Russia, Mr Richardson accompanied him to St Petersburg, where he remained four years. At this period he acted as Lord Cathcart's secretary, and here, most likely, he acquired that finished polish of manner for which he was remarkable.

As a teacher of youth, Mr Richardson has been seldom excelled. Although of course many of his pupils were further advanced, the greater proportion of his first year's students were boys from the grammar school, of twelve or thirteen years of age; and Mr Richardson endeavoured to instil a love of literature at this critical period of life, by making the lessons as easy and attractive as possible. He generally commenced with a book of Caesar's Commentaries; and he contrived to pre-engage the affections of his young hearers for the simple but beautiful narration of the renowned writer, by a brief but lucid account of the contents of the different books into which the work is divided. He then by degrees introduced his class to an acquaintance with the more difficult classics; constantly testing the progress it was making by frequent examinations. He delighted to bring forward modest talent by suitable encouragement; and as his praise was given judiciously, it was duly appreciated by his scholars. The 'old side,' or boys of the second year, had tasks of greater magnitude prescribed to them; and it was for their use chiefly that the professor held his private class, in which he lectured on Roman antiquities, and on the laws of fine writing, exemplified from classical authors.

Mr Richardson, at this period, was very methodical in the arrangement of his dress, as well as in his other habits. In the morning hours all was in dishabille—even the white neckcloth being exchanged for the *cosy* handkerchief. At eleven o'clock, a change appeared for the better; and it was evident that the learned professor had been under the hands of the tonsor, who had improved his outward man considerably. The wig, however, if exchanged, was still unpowdered. But at two o'clock—the *private* hour—the professor appeared in full gala, with powdered wig, lace ruffles, often silk stockings; in short, all the appearance of a fine gentleman of about the middle of the eighteenth century, probably the dress that he had been accustomed to in his youth. I must not omit that at this hour a diamond ring was always carefully displayed, dazzling the eyes of the admiring students. You must recollect that all

this was fifty years since. Mr Richardson's company was always exceedingly acceptable to the merchants of Glasgow; and, being a bachelor, he was a frequent diner-out. He was a little of a *bon vivant*, and suffered the usual penalty of good-living by a periodical access of gout. Dining one day at a party, when the turtle-soup was *superbe*, the professor got his plate replenished more than once, always exclaiming: 'There is gout in every spoonful, but I can't resist it—I can't resist it!' In the performance of his collegiate duties, Mr Richardson was most assiduous; and when many of his colleagues gave up their classes on the 1st of May, he was always at his post till the 10th of June. This devotedness on his part was the more meritorious, as he had a pleasant country seat, near the Water of Endrick, in Dumbartonshire, to which he was much attached, and where he always spent the summer recess. Gout, his old enemy, proved too powerful at last for this highly-amiable and gentleman-like person; and I lament to say that he died in great agony from an attack of that complaint in the stomach. Foxglove had been recommended to him, and this powerful medicine was, after his decease, found in his desk; which added to the regret of his friends that it had not been administered.

Mr Young, the professor of Greek, succeeded Dr Moor, and by his abilities maintained the high position which this class had acquired. By his contemporaries, Mr Young was considered to be a man of original genius, an excellent classical scholar, an acute critic, a connoisseur in music, and perhaps in the fine arts generally. The ingenuity and eloquence with which he expounded a favourite author captivated the attention of those of his hearers who were designed for the learned professions; and even by many of his scholars who never opened the page of a Greek classic in after-life, the admirably quaint humour with which the professor translated an ode of Anacreon, or a dialogue of Lucian, or a scene of Aristophanes, was long remembered. With such qualifications, his friends sometimes regretted that he did not give to the world some fruits of his favourite studies. The high renown of Porson, Parr, and Burney, at that period probably prevented him from entering the lists against them in the fields of Greek literature; and as his annual income arising from the number of students attached to his class, as well as from private boarders, was constantly increasing, he may judiciously have preferred 'solid pudding' to 'empty praise.' In 1783, Mr Young published anonymously his 'Criticism on Gray's Elegy in a Country Churchyard,' meant as a burlesque of Dr Johnson's harsh, and, as they were generally considered, unjust strictures, on that excellent poet. This little work is too lengthy for a mere *jeu d'esprit*; and although the reader is reminded of the occasionally inflated peculiarities of Dr Johnson's style, the mind soon becomes fatigued with the endeavour, real or pretended, of the writer, to discover flaws in one of the finest poems in the English language.

Mr Young was a great admirer of histrionic talent. When Edmund Kean first made his appearance on the Glasgow boards, no one seemed more delighted than our professor with what it was then the fashion to call the 'new readings of Shakspeare,' by that clever but eccentric actor. On these occasions Mr Young's little *punchy* figure, perched in the stage-box, would have formed a subject worthy the pencil of a Hogarth. I think I see him applying an opera-glass to his eye with one hand, while with the other he kept vehemently thumping the wooden partition of the box, as any brilliant trait in the performance elicited his admiration—joining lustily at the same time the chorus of bravos which resounded from all parts of the house. Mr Young entertained a high opinion of the Rev. Dr Chalmers. A person who was present told me, that in the faculty room, some of his colleagues objecting to the peculiar

style of Dr Chalmers, Mr Young said: 'That may be all very true, gentlemen; but I know that I am a miserable sinner, and it is a style which speaks to my conscience.'

Mr Jardine, professor of logic, was one of the most useful teachers of youth in my time. Before his incumbency, it had been the established practice of the professor of logic to read Latin lectures on the Aristotelian logic, with little advantage to those of the students who were to be afterwards engaged in the active pursuits of life. The sagacity of Mr Jardine saw this defect, and how it could be remedied. As has been correctly stated in a biographical work—'After a simple analysis of the powers of the understanding, he devoted by far the greater part of the course to the original progress of language; the principles of general grammar; the elements of taste and criticism; and to the rules of composition, with a view to the promotion of a correct style, illustrated by examples.' The plan which he adopted of making the students give a written account of the lectures, and of occasionally handing these essays to be corrected by each other, under his own superintendence, had an admirable effect. It awakened genius, and stimulated mediocrity. A few critics and future reviewers were probably formed by this process; but, what was of infinitely more consequence, the youth who were afterwards to be engaged in trade or commerce were taught to think for themselves, and to express their thoughts, both in speaking and writing, in clear, intelligible language.

In politics, Mr Jardine was a Tory; but this did not prevent his being on the best terms with his colleagues, Mr Millar and Mr Young, who were equally attached to the opposite side. Mr Jardine's appearance was more like that of a bluff, healthy country gentleman, than the professor of a college; and his frank, open manners corresponded with his exterior. His time was too much occupied in the winter months to allow his going much into company; but when there, he was social and pleasant, and fond of a well-timed joke. He used to tell with great glee, that, when in France, he had been commissioned to procure a French cook for a Scotch nobleman. On his return, he had happened to meet his old acquaintance, Jaques, and asked him how he liked his new situation. 'Ah—ah,' said Jaques, with the peculiar shrug and grimace of his country—'*toujours de barley-brot!*'

GOLDEN ISLAND.

MOST of the islands which travellers meet with cleaving the strong current of the Nile, and dividing it into two majestic branches, are formed one year, to be eaten away and disappear the next. The rapidity with which they rise and become covered with a low vegetation, is only less marvellous than the rapidity with which they dissolve. They generally have a sand-bank for basis, and this is the true reason of their uncertain tenure of existence. Sometimes the Nile changes its course, almost abandons one of the branches into which it has divided, and allows the island time to establish itself slowly for years. It then capriciously returns, gnaws underneath the already lofty banks, washes violently over the surface, and in a few seasons the newly-created fields are carried away, and turbid eddies alone remain.

In some few instances, however, from circumstances which it would be difficult to explain, these alluvial islands acquire sufficient strength and solidity to profit by the periodical inundation, instead of being destroyed. They then increase rapidly in size and elevation; and, almost without the assistance of husbandry, yield a generous support to the colony which does not fail to

migrate to them. Geziret-ed-Dahab, or Golden Island, situated opposite Atfeh, on the Rosetta branch, is one of the most remarkable examples.

We quitted Shibrakit, some miles higher up, on a bright December morning. There had been a warm discussion as to whether or not we should return by the canal to Alexandria. The crew, who could not understand what pleasure we took in wandering about apparently without an object—tacking from one bank to another, coming to an anchor in places where there were neither curiosities nor coffeehouses, taking strolls over the stubble-covered fields, sitting for hours under a thin canopy of acacia-trees, gun in hand, looking at half-a-dozen crows making mysterious evolutions around a neighbouring grove, and never thinking of taking a shot. This kind of life perplexed the crew exceedingly, and they voted unanimously in favour of returning to the dusty purlieus of Miniet-el-Bassal, or the Port of Onions.

We objected—for the idle life of the Nile boat had charmed us—and when we got into the glittering Fouah Reach, ordered the steersman to take the right branch, and put Golden Island between us and the steamer funnels, the cluster of masts and yards, and the mud storehouses of Atfeh. In a few minutes, driven down by the current, and aided by a light wind that came along in puffs, and now filled our huge sail, and let it flap lazily over head, we were once more out of sight of all habitations, with nothing but blue waters, blue air, and almost blue vegetation around. Despite the time of year, it was a tremendously hot day, and all objects seemed to tremble dizzily in the sunshine. Now and then, as it were, a shower of pigeons was shaken down from their cool look-outs in the palm-trees upon the torrid surface of the stream. They fell like shining flakes of silver, as if about to melt in the waters; but suddenly their wings flapped vigorously, there was a moment of hurry-scurry, and then the whole flight swooped away in an ascending semi-curve, and went fluttering into a date-grove on the opposite bank. Some warm-backed, bright aquatic birds, with their sharp beaks, from time to time scratched the burnished mirror along which we were sliding, or dashed up a vapour of glass-dust with their pinions. White ibises settled down in majestic flights towards the fields which we could not see; and that aerial pirate, the hawk, cruised about far up in the sparkling air, or lay-to overhead in sight of a prize. Upon a distant dike, I remember, we could distinguish two or three camels moving slowly along, amidst a cloud of hot-looking dust; and as we left the Delta bank, two or three huge breathless buffaloes came and dropped themselves with a lazy splash into the stream.

We ran up alongside Golden Island, and made fast a rope to a tree; for we had determined to lunch ashore. In a few minutes the industrious Ahmed, by us duly assisted, had spread the cloth beneath the twinkling leaves of some acacias, that afforded a kind of mitigated shade; and we were deep in the mysteries of cold beef, ham, and bottled porter. When we had lounged a befitting time, in order to give our powers of digestion fair play, we proceeded to explore the island.

Its size is considerable; but I know not how many acres or how many groves it contains. Towards the northern extremity, the trees became more thickly planted, and the cultivation more regular. We followed a kind of footpath along the bank—no doubt made by the tracking crews of boats—and at length came in sight of a white sheikh's tomb, with a small dome, and an enclosure. As we approached, an old man, who had been sleeping under a blanket, started up so lightly and actively, that his Bedouin origin would have been at once apparent, even if the motion of his hand towards the place where the dagger usually

hangs had not revealed the fact. He smiled to notice that we observed this circumstance; and sat down again quietly, after saluting us. We returned his salute cheerfully, and took up our position close at hand, with a palm-trunk for a sofa-back. This was a fair beginning of an acquaintance; and our offer of a pipe concluded the business.

'I drink tobacco,' said the old gentleman, handing back the tube after two or three whiffs; 'but smelling tobacco is better.'

This was equivalent to saying, 'Have you any snuff?' We regretted not being able to gratify him. He said it was no matter, for that smoking and snuffing were no longer habits with him. When he was young, he used to empty a box a day (a second Napoleon), but those times were past. (It was difficult to say which he regretted most—his youth or his snuff.) Everything was very much changed now: he heard talk of only new things and new men. He could not understand what it meant; feared very much that all was wrong; but, after all, Allah was great, and Effendina (our lord—the pasha, namely) was —. Here came an indescribable gesture, by which the Arabs express might and power. The excellent Conservative Bedouin seemed disposed to accept established facts.

We asked him how he came there, where he came from, and what he did. The impertinence of these questions was not at all apparent to him. He replied with random good faith (quietly retaining one of our pipes, the first time we offered it, when he found that the move for snuff had been disconcerted), and we at length acquired a tolerable idea of his history. As his tongue got untied, indeed, the garrulity of it became excessive; and how this happened is worth mentioning. My friend L—, who professed to be subject to cramp in the stomach, always went about with what he called a *monkey* (the poet calls it a *cruze*, I believe) full of rather strong brandy-and-water, and our interlocutor's eyes were directed towards it very often. At length he asked casually if it was medicine. L— replied that it was a draught calculated to raise the dead; to which the Bedouin responded that he was very ill.

'You do look deuced pale,' quoth L—, without offering his bottle.

'Yeh!' exclaimed the old fellow, quite surprised at this confirmation of his assertion.

'And I would recommend you to be bled. My friend here is a *hakim*.'

'Let me try the medicine first,' said the patient, whose hand had been clutching towards the unlabelled phial for some time, and who now edged nimbly along the ground, patted L— coaxingly on the back, and, after having glanced around to ascertain that none but infidel eyes beheld the deed, took a draught that no prescription would have authorised. 'Bu-ono; tayib; ver good; az-im!' exclaimed he, shewing the skill in foreign languages which he had acquired during his visits to Atfeh. The effect was magical; and some of the old gentleman's confidential communications became even too intimate.

Salah Ibn Gaud, or Salah Son of the Camel, was formerly a sheikh of the tribe of Waled Ali. According to his own representation, he enjoyed considerable influence at one time among his people, having been indeed of sufficient importance to have been selected by the pasha as one of the hostages taken from the turbulent tribe to which he belonged, when, in 1820, its headquarters were removed from Mudar to the neighbourhood of Damanhour. We do not repeat the hyperbolic accounts he gave of his exploits in the Bedouin wars: how, for example, his skill as a shot was so great, that at 500 paces, when on a horse going at full speed, he could 'break the head,' as he expressed it, of another cavalier moving in an opposite direction. But a curious tradition with respect to Golden Island interested us much. He said that he was one day sitting

at the door of his tent, near the confines of the cultivated land of Egypt, reflecting on the fall of his fortunes, and on the half-servitude in which he lived, when a stranger came up and asked him for hospitality. The request was of course complied with; but was accompanied, as is often the case in these degenerate times, with bitter reflections about diminished means, desires limited by power, and so forth, which are merely hints that some kind of payment would not be disagreeable. The stranger explained that he was a poor pilgrim; and as both professed poverty, the conversation naturally turned upon riches. A variety of stories, in which gold and jewels played a great part, were related. Among other things, the pilgrim said that, according to tradition, in the time of the early caliphs, Berimbal was a great city, having a governor invested with mighty privileges, and enjoying the especial favour of his master. This governor, named Ali the Splendid, distinguished himself by his exactions, although not by his cruelties, unless he was violently opposed. Among other means of amassing wealth, he levied a fixed contribution on every boat that passed down on its way to Rosetta with produce of the country, or returned with foreign merchandise. The abuse was tolerated, because Ali the Splendid always accompanied the taxes he sent to the public treasury with presents to the great men of Cairo, and even to the caliph himself. In this way he became immensely rich, and was supposed to enjoy perfect felicity. But in heart he was unhappy, because, although he had wives and slaves, Heaven had not blessed him with any offspring. He used often to look forth between the gorgeous curtains of his palace windows, and behold the women going down to the river-side with their laughing children on their shoulders, and his eyes would fill with tears, and he would groan, and turn away in sorrow and despair. Of what use to him was his wealth in silver and in gold, in jewels and in precious stones, if he had not a son to cling to his knees, or play with his slippers? At length an adviser told him to consult a magician; and the magician, after having made his calculations, told him that he must divorce one of his wives, and substitute in her place, by force or cunning, the wife of a cobbler named Mustafa. Ali the Splendid believed; and he called Mustafa before him, and coaxed him to divorce his wife Fatimah. But the cobbler replied that he loved his wife, and would not part with her. So Ali caused him secretly to be slain, and took the woman into his harem. The magician had prophesied correctly. A son was born; and Ali, forgetting the crime that he had committed, was happy for many years. But it is decreed that those who do evil deeds shall in the end suffer; for when Murad grew up to be a youth, he caused his father more trouble and sorrow by his disobedience and his vicious character than he had caused him joy in the early time of his childhood. The old man became peevish and irritable; and in order to occupy his time and attention, increased his exactions upon the people, and became generally hated as a tyrant.

Murad delighted in crossing him, and bringing him into trouble. It happened one day that a large Dahabieh, magnificently decorated, was seen coming down the Nile, and passed, without paying any attention to the officers that hailed it to come along ashore and pay the tribute. So several boats, filled with soldiers commanded by Murad, went forth and surrounded it with cries and menaces. The crew ordered them off, saying that the youngest daughter of the caliph was on board, and that dire vengeance would be inflicted on those who interrupted her progress. But Murad laughed, and said that he had heard that Nefeca, the youngest daughter of the pasha, was dead, and that he was not to be deceived. So he went on board, beat the crew and the eunuchs, and forced his way into the cabin, where the girl was reclining with her slaves. He became enamoured of her at once, and determined to

possess her; so he ordered the crew to be slain to a man, sank the boat, and carried away Nefessa and her women to a country-house which his father had given him for his pleasures. The soldiers, whose affection he had gained by largesses and indulgence, and who knew the dreadful punishment that would be inflicted on them if they spoke of what had happened, kept the secret; and it was some weeks before it began to be asked in the cities and bazars of Egypt—'What has become of the daughter of the caliph?' Orders were sent to all the governors of the provinces to make inquiries; and torture and death were promised to the guilty, whilst hopes of magnificent rewards were held out to those who should give information; but for a long time nothing was learned of the truth.

Murad passed the whole of his time shut up in his country-house, and never appeared before his father in the divan. Ali the Splendid became at length uneasy, and sent to request him to come; but he was disobeyed. He then despatched a positive order; but was again disobeyed. Upon this he called before him the magician, and in the anguish of his heart asked him to read the truth in his numbers, and to tell why his son neglected him. The magician smiled with a wicked expression, went through the prescribed form, and then said, 'Murad is now with the Princess Nefessa in his pavilion.' Upon this Ali the Splendid fell down upon his face, and exclaimed, 'Wo is me, I am an unfortunate and a ruined man!' He then rose, called his guards, and hastened forth to the pavilion. But when he arrived, he found his son lying upon a couch, with the princess by his side—both dead—and the women weeping around; and he was told that the two had loved each other in spite of the cruelty and violence of Murad, and that a messenger had arrived, saying, 'Ali the Splendid has heard the truth, and is coming in anger;' and that they had taken poison, and had died. Never did poor man feel the despair that this rich man felt when he heard this news. He tore his beard, rent his garments, rolled in the dust; and then, clinging to his position and his vile gold—now that all his better hopes were prostrated—hastened back to his palace, collected all his wealth, filled numerous large chests, and set out for Cairo, in order to avert the vengeance of the caliph by bribes and presents. But there was a line written in the book of fate. Before he reached Fouah, a gust of wind upset his boat in the middle of the Nile, and he was drowned with all his people and all his riches. A bank of mud soon formed over the spot, and then an island, which was called, in memory of this story, Geziret-ed-Dahab, or Golden Island.

'And how comes it that you are settled here?' inquired we of the Bedouin, after offering him another strengthening draught—not the second, nor the third.

His eyes twinkled, and his voice trembled as he replied—'The pilgrim told me that there was a story current amongst the learned about times past, that after the lapse of three hundred years, these trunks of gold would be uncovered by the plough of a husbandman. So when I found that misery pressed still more upon me, I took all that I had, and became a fellow of the land of Egypt, and reached this place, and was named inspector of the island for the siraskir; and the day of good fortune may at length arrive.'

A few minutes afterwards the old gentleman dropped off asleep, and we left him to continue our voyage to Rosetta. On returning, we espied him driving a donkey along the tracking-path, and endeavoured to renew the acquaintance; but when we talked of the money of the governor of Berrinbal, he looked uneasy and perplexed, and professed not to understand.

'It is my opinion,' quoth I—, 'that the old villain sucked in the whole of that story from my monkey. He must have supposed you to be a shair (story-teller), and thought himself bound to pay for his medicine.'

'Possibly,' replied I; 'but it may be that he regrets his communicativeness, and seeing us here again, imagines that we too are on the look-out for the riches of Golden Island.'

SMOKINESS OF MANUFACTURING TOWNS.

NOTWITHSTANDING all the legislation of late years against the smoke of factories, we observe from time to time that prosecutions are still necessary at Manchester, Glasgow, and other cities of industry, in order to enforce the proper regulations. Magistrates in such towns must in general feel a disposition to press as lightly on the convenience of manufacturers as the letter of the law will admit of, and many doubtless are under an impression that manufacturers have not the matter entirely in their power. We suspect that the leniency is to a great extent misdirected; for experience and close observation have convinced us that, in ordinary circumstances, the smoke of a factory furnace may be reduced to an amount scarcely appreciable.

The cause of voluminous smoke from a large furnace is the abruptness of the deposition of fresh fuel. A furnace-man knows well that, by a judicious mode of shovelling in his coal, he can lessen the amount of smoke considerably. Much more can it be lessened when the furnace is fed slowly by an appropriate mechanism. It cannot be too strongly impressed on magistrates that there is a mechanism by which the requisite fuel can be applied at precisely the rate in which it is required, and so as to cause the smoke to be consumed in the furnace, leaving at the utmost some impalpable fumes to pass off by the chimney. There is the less need to be scrupulous in acting upon this fact, that, by such a mode of feeding furnaces, a very considerable saving of coal is effected.

At the hazard of offending by repetition, we shall relate what is done at our own furnace for the consumption of smoke. The engine, be it understood, is one of ten-horse power, employed to drive ten printing machines. The smoke-consuming apparatus under Jukes's patent was applied to the furnace in 1848, at an expense of £105. It consists essentially of a set of chain bars revolving on blocks, and carrying in the coal with a slow, regulated motion, under the check of a hopper placed at the furnace-mouth. Power for the movement is obtained from the engine. The effect is, that a frontier of fresh coal is always passing onward into the glow of the fire, producing only the smallest quantity of smoke possible in the circumstances, and this smoke is completely burnt before it can pass along the length of the furnace. At putting on the fires, and in reviving them after meal hours, smoke is produced in greater quantity, and forms a volume in the chimney for a few minutes; but this passes away, and the chimney in general emits nothing but a quantity of waste steam. Of the numerous domestic chimneys by which ours is surrounded, there is not one which does not act more as a nuisance to its neighbourhood than our ten-horse power engine flue.

During the twelvemonth previous to the application of the apparatus, the quantity of coal consumed was 284 tons. During the ensuing year and a half it has been 395 tons, although there was one more machine in operation during that time, and a much greater amount of work at over-hours. The quantity of work in the year ending Sep. 2, 1849, may be expressed by the sum of paper used, which was 7,200,000 sheets; that of the year and a half ending March 2, 1851, was 12,720,000 sheets, a ratio of about 13 to 11. Had the same quantity of coal for each thousand sheets been used during the second period, the total quantity required would have been at the rate of about 340 tons per annum. It appears that there would thus have been a relative saving of 78 tons of coal per annum. We are sensible, however, that the quantity of work may

have exercised no influence in the case, and therefore would ask attention to no more than the positive or absolute saving, which may be reckoned at not less than 80 tons per annum—an amount much more than commensurate to the outlay for the mechanism. There is also a saving of labour to the extent of about half a man—the engine-man being so much relieved from attendance at the furnace, that he is enabled to attend to a number of other duties. On the other hand, the brickwork of the furnace requires somewhat more frequent repair—a proof, however, merely of the superior efficiency of the fire under the new system. The outlay on this account cannot materially affect the money part of the question.

As far as a furnace under such circumstances is a criterion, we certainly can now entertain no doubt that factory smoke is a remediable evil. There may be instances where sudden accesses of strength are occasionally required—as where a steamer is to be put to unusual speed; but bating such, we can see no difficulty in applying Jukes's, or some other equivalent plan (if there be such), and thus at once effecting a saving to the user, and relieving the public from a nuisance. We may add that the party to whom application should be made for a licence to use Jukes's patent, is Messrs Surmon & Co., Canal Bridge, New North Road, London. This company also supplies the apparatus, and superintends its erection.

THE FORTY-SECOND REGIMENT BEFORE AND AFTER WATERLOO.

DECIDEDLY the most vivid, and, even after this lapse of time, thrilling of my schoolboy-day reminiscences, is one connected with the return of the 42d Regiment to Edinburgh, after the hard-fought field of Waterloo. I had joined the crowd that, a short time previous, had escorted that gallant corps to Leith from Edinburgh Castle, *en route* for the continent, to join the allied army under its illustrious leader. It was then upwards of eight hundred strong, and a finer body of men could not have been seen. They were arrayed and marshalled in all the pomp and circumstance of military bearing; every appliance was in its place, and in perfect order; and the graceful waving of the beautiful dark plumes with which the bonnets of our Highland regiments are crowned, together with the glittering of the rays of a bright summer sun on their polished firearms and accoutrements, produced altogether one of those imposing results of which the profession of arms can alone furnish the elements. The numbers which on that occasion accompanied this distinguished and always popular regiment were immense—a great proportion being females, many of whom stood to the men in the ordinary relationships of wives or sweethearts, mothers or sisters; and these clung as closely to the dear objects of their affection as the movements and discipline of a body of troops would permit, that not a moment which could be spent in their society might be lost.

The band was playing, as is customary on such occasions, the favourite air of 'Dinna think, bonnie lassie, I'm gawn to leave ye,' with the intention, no doubt, of keeping up the spirits of all, but actually producing the opposite effect, as too many on that occasion felt that they were gazing in all probability for the last time on each other. At length the port of Leith was reached; and as the vessel which took the troops aboard, to convey them to the transport in the roadstead, cast off her moorings, the deafening huzzas from the assembled multitudes produced one of the most sublimely saddening effects I ever witnessed. Such scenes and feelings the present generation luckily can hardly sympathise with or appreciate, as no native of this country (who has remained at home) under

forty years of age has ever been influenced by similar ones.

Our gallant friends arrived in time to take an active and brilliant, but to them most fatal, part in the crowning engagements which resulted in hurling Napoleon from his throne and political existence.

It was in the month of March 1816 that the intelligence reached Edinburgh that the remainder of that once noble regiment, the 42d, were to pass the night at Musselburgh (six miles distant), and were next day to enter the city. The news spread rapidly, and next morning every schoolboy was aware of the fact. I was then attending a classical academy in the New Town; and as we assembled in the neighbourhood of the school on that eventful morning, we congregated into groups, and earnestly discussed our hopes and fears of the chance of being permitted to join the crowds that were even then pouring in the direction of Musselburgh to welcome our gallant countrymen. These discussions were, however, suddenly, and to most of us somewhat harshly brought to a close by the sound of the well-known shrill whistle (equal almost to that of a railway) with which our worthy preceptor, with his head and shoulders projecting over one of the windows of the schoolroom, was wont to assemble his *élèves*. Many took French leave on the impulse of the moment; while the rest, among whom I was included, ascended the stairs with most unwilling and snail-like steps, and took their accustomed places on the benches. Our feelings were, however, not allowed to remain long in a state of suspense; for our master almost immediately, amidst our breathless silence, informed us that he also had heard of the approach of our brave countrymen, and of the intention of going to meet and welcome them on their approach to the city, and that he highly approved of such intention. Then, with one of his usual cautions to take care of ourselves, he at once dismissed us. Ere the clouds of dust which were raised by our tumultuous jubilation had cleared away, we had burst from the school, and joined the living stream which was then pouring from every avenue of the city in the direction of Musselburgh. The morning was unusually mild for the season, and was one of those lovely spring days which even in our northern clime occasionally chequer our vernal experiences, and make us feel that the mere living, or animalism of our existence, is a great boon and privilege.

The party to which I had attached myself met the objects of our solicitude about the Maitland Bridge; and never shall I forget the impression which the first glance at all that remained of the so lately gallant array made upon my mind—the time seemed so short since I had seen them in all their gorgeous panoply and glory of numbers, that the contrast was most startling which the handful (not much above two hundred) of worn-out, travel-stained looking men presented. Their once bright scarlet uniforms exhibited all the shades of depression which that colour is capable of assuming; while very few retained any remnant even of the plume which distinguishes the Highland soldier's head-dress. Most had plain bonnets, and a great many had not even their grand national characteristic article of dress—the kilt—trousers and trews having been substituted. No one who has not actually witnessed a similar exhibition of the sad and desolating effects of war can fully conceive what our feelings were on the first appearance of our poor countrymen. Still these were the men who had stood undaunted against the Polish lances and cuirassiers' sabres at Quatre Bras, and remained unshaken and victorious amidst the annihilating thunders of Waterloo; and every other sensation was for the moment buried in the burst of enthusiasm with which we added our welcome to the general chorus. As the procession

reached the suburbs, the crowd became so dense that the order of march could hardly be observed; and those serried ranks which had withstood unbroken all the attempts of Napoleon's cavalry and artillery, gave way on all sides before the irruption of their fair countrywomen.

On entering the Canongate, some truly touching episodes took place: here and there a female might be seen rushing wildly amongst the ranks of the soldiery, and anxiously inquiring whether such a one was alive, and with them. When, as in too many instances, an answer in the sad negative had to be given, the agonised look and suppressed scream with which it was received was truly heartrending, and brought tears to the eyes of all who were witnesses of it. Occasionally, in strong and pleasing contrast to such scenes, a lover, brother, or husband was found. When it was the latter, and he was also a father, his firelock was seized by one of his eldest boys; while, leaning on the arm of his partner in life, and having his youngest child perched on his shoulder, he proudly ascended the High Street. As the procession approached the Canongate Jail, a Lochaber axe (belonging to the Town-Guard soldier on duty there, and borrowed from him for the occasion) was seen projecting from one of its windows, to which was attached, as a flag, a pocket-handkerchief, on which was pinned a sheet of paper, having written on it in ink, in large characters, the words—'Welcome, gallant heroes!' shewing in a most touching manner that the enthusiasm which was so ecstatic on the outside had even penetrated the gloomy recesses of a prison, and made its inmates for the time forget their woes in the all-absorbing feelings of the moment.

As they advanced up the High Street, where it becomes wider and the houses loftier, the masses became so dense that it was almost impossible to proceed; and from the windows of many of the houses of that most picturesque street were seen hundreds of smiling female faces, and many fair arms waving handkerchiefs, while the loud and continued huzzas which burst forth on all sides, and re-echoed by the imposing edifices around, were perfectly deafening. And thus escorted, and thus welcomed, all that remained of the gallant 42d re-entered the Castle of Edinburgh.

It has been my lot in life to witness many splendid processions of various kinds; but all were tame and commonplace in comparison with that which I have attempted to describe. I have already said, that luckily with such scenes the present generation, at least the younger portion of it, are unacquainted. I have often thought that in such ignorance there is a danger. Let me impress on my juniors, that it requires but a very little experience of the desolating effects of war to wean a humane and conscientious mind from the idea of its vaunted glories. Let them read in even such imperfect recitals as the present the misery which comes from these unholy contentions, and resolve never to admit for a moment that peace may be broken, except for the most grave and onerous causes.

REPRODUCTION OF LIMBS IN THE HUMAN SUBJECT.

Dr Simpson, in a paper read to the British Association, has shewn that the power of reproducing and repairing lost parts is greatest in the lowest class of animals, and decreases as we ascend higher and higher in the scale of animal life. He then points out that the embryo approaches in this, as in other respects, the physiological life and powers of the lower animals; and, consequently, when the arm or leg is amputated during embryonic existence, as not unfrequently happens from bands of coagulable lymph, and the results of disease, the stump structures reproduce a small rudimentary hand or foot, as the crab or lizard does. He shewed various casts and drawings of cases of hands thus reproduced; and two living examples were exhibited.

TO MY GODCHILD, ALICE.

Alice, Alice, little Alice,
My new-christened baby Alice!
Can there ever rhyme be found
To express my wishes for thee
In a silvery flowing, worthy
Of that silvery sound!
Bonnie Alice, Lady Alice!
Sure that sweetest name must be
A true omen to thee, Alice,
Of a life's long melody.

Alice, Alice, little Alice,
Mayst thou prove a golden chalice
Filled with holiness, like wine;
With rich blessings running o'er,
Yet replenished evermore
From a fount divine!
Alice, Alice, little Alice,
When this future comes to thee,
In thy young life's brimming chalice
Keep some drops of balm for me!

Alice, Alice, little Alice,
Mayst thou grow up a fair palace,
Fittingly framed from roof to floor,
Pure unto the very centre,
While high thoughts like angels enter
At the open door.
Alice, Alice, little Alice,
When this goodly sight I see,
In thy woman-heart's rich palace
Keep one nook of love for me!

Alice, Alice, little Alice,
Sure the verse fails out of malice
To the thoughts it feebly bears;
And thy name's sweet echoes, ranging
From quaint rhyme to rhyme, are changing
Unto voiceless prayers.
God be with thee, little Alice!
Of His bounteousness, may He
Fill the chalice, build the palace,
Here—unto eternity!

November 25, 1850.

CAPTURE OF A SEA-COW.

Messrs Clark and Burnham lately succeeded in capturing a sea-cow, near Jupiter Inlet, Florida. The animal was caught in a net, was a male, and nine feet three inches in length. They succeeded in taking it alive, and shipped it to Charleston for exhibiting it. It was very wild when first captured, but soon became quite tame, and ate freely of grass, &c. Its tail is in the shape of a fan, and is two feet five inches broad. It has no hind-feet; its fore-feet are similar to those of a turtle, and it has nails like those of the human hand, but no claws. Its mouth and nose resemble those of a cow; it has teeth on the lower jaw, but none on the upper. A female was also taken; but it was so large, and becoming entangled in the net, made such desperate exertions to escape, that the captors were compelled to shoot it. They preserved the skin, however, which is fifteen feet long. This is the second instance (says the 'Havannah News') within our knowledge that the sea-cow has been captured. Some years ago, during the Florida war, Colonel Harney shot two of them in the Everglades. He preserved the hides, and they were exhibited in St Augustine as a great curiosity. We saw a rib of one of the animals yesterday in possession of a gentleman of this city, to whom it was presented by Colonel Harney. He informed us that he had partaken of the flesh, and pronounced it remarkably tender and palatable, and far superior to beef.

SUCCESS.

THE aims of the age are remarked to have a prevailing reference to material achievements and acquisitions. To succeed in amassing wealth, to advance in social status and respectability, to realise the dreams and projects of ambition, to attain, in one or another way, to a position of personal brilliancy or importance, is the leading and accredited tendency of the intelligence and enterprise of the nineteenth century. The railway is constructed, not immediately with a view to the service of man in travelling, but for the purpose of obtaining a profitable investment for industry and capital; the houses of legislation are assembled, not to deliberate solemnly on the needs and requirements of society, but to defend and assert the interests of separate and contending classes of the community; education is not a noble and exalted training of the gifts and faculties of youth, to the end that they may become persons of worth and intellectual vigour, but is restricted to such disciplines and courses of cultivation as are thought to be calculated to promote a secular prosperity: the whole structure and economy of our life is infected with a taint of gross and acknowledged selfishness, and has no higher contemplation than that of a realised acquisitiveness, pointing only to such substantial or splendid acquisitions as confer upon the successful a material and personal dignity. To be the rich man or the brilliant man, the powerful and ascendant party, is the end and recognised design of the diversified activity which is displayed by all the aspiring men and parties of the age. This is the *success* which almost every man contemplates, and pursues according to his energies and opportunity.

It seems to us that devotion to materialities is a necessary stage in the progress of humanity. Before a man can properly attain to such a position of ease and freedom as is needed for the free and perfect manifestation of his character, it is essential that his bodily requirements should be secured to him, either in the shape of some actual possession, or by some recognisable means which he may employ for the purpose. The basis of his wellbeing is some available domestic and social satisfaction, an actual and sufficing measure of worldly means and comforts, or, at the lowest, the possibility of living by his honourable exertions. Unless this can be obtained, the generality of mankind will necessarily be the victims of their circumstances; whatever is manly and noble in their natures will more and more degenerate, or remain utterly undeveloped and unknown to the possessor—will be, in fact, a tragical waste of faculty, and like the gift of insight to one who is imprisoned in perpetual darkness. Hopelessness hangs for ever, like a thick impenetrable curtain, over the entire aims and prospects

of him that cannot work out his way to some endurable independency. He must be a man in his own right, and have at least such a command over his own energies, as to be able to realise, by means of them, such a condition of being as he can inwardly respect, and be in some sort contented with—a condition which shall not oppress him by any sense of degradation, or wrench the working of his faculties from the natural sphere of their operation. It is a sense of the value of this individual independency—whether for purposes of culture or for some lower satisfaction is of no present importance to the consideration—it is, we say, a sense of the need of being established in honourable and fixed relations with the world, which so forcibly constrains mankind to surround themselves with the manifold appliances of material advantage. The same feelings prevail with societies of men, or nations; and in their case, likewise, such action is natural and justifiable to a certain extent. It is most important, however, for both to know and observe the limits within which the pursuit of materialities is allowable. It is very evident that in our society, as yet, men in general rest satisfied with the attainment of wealth as an *end*, and in no other light is it regarded by the great mass of those who are struggling more or less hopelessly for its attainment.

Rightly viewed, that worldly success or stability which we speak of is but the platform from which a man may announce his manhood—the practical foundation whereon he is to build up and give visible reality to his being. The place he occupies in the social arrangements, the position he takes as an individual of the human race, is one which can never rightly supersede the original relations that connect him with a higher destiny, and a grander and profounder duty than any that belongs to his merely secular occasions. For it is to be remembered that man is distinguishable in the world as a being endowed with immortal and spiritual capacities, and that in the culture and perfection of these consists his highest notability. This is a truth which, in different dialects, and under different forms of representation, has been proclaimed by all the thoughtful and inspired teachers that have ever appeared among mankind; and it is even now verbally accepted in all cultivated communities as a commonplace and obvious proposition. Tacitly, and by public confession, it stands emblazoned in history and in contemporary opinion as a truth of the loftiest and most significant concernment. It obtains at least a formal recognition wheresoever man has become in any degree enlightened. Temples and goodly institutions for its promulgation and enforcement stand prominently in every land; poets, and thinkers, and persuasive orators, have been born in all ages to reveal and elucidate its applications;

and by the universal acknowledgment of human reason and belief it ranks as the sublimest fact in the mystical constitution of humanity. We stand under the dome of immensity, amid the populous dissonances and commotions that throng the visible aisles of time; but sounding beyond them and above them, if we will but listen, we may hear the lofty harmonies and solemn anthems that are pealing from the temple of eternity! The old voices of the past, the slumbering dust of the dead and buried generations of mankind, the memories of the wise and faithful that have cast the shadows of their greatness across the paths of men, the aspirations that arise in every heart to prophesy of wonder and hopeful expectations—these all speak to us with eloquent and touching admonitions, and remind us of the vast and lasting consequences which proceed from the purposes and motives that determine our daily deeds and resolutions.

If, then, a man would properly fulfil his destiny, he must regard the advancement of his reasonable and moral interests as constituting by far the most significant, and, in fact, his only veritable success. In our dealings with external nature, it is undoubtedly an authentic aim to subject its varied elements and combinations to our natural uses and occasions; but inasmuch as all these perish in the using, it is manifest that they are designed to be subordinate and subservient to some higher end than any which is apprehended by the senses. The wealth and bounty of the world are not to be despised, nor are any of the advantages which have been secured to us by the intelligent and laborious device of our fellow-beings to be indolently neglected, or spurned aside with a supercilious indifference or disdain; for they are true and substantial parts of the beneficent provision which a bountiful Creator has ordained for our necessities, and are plainly intended to sustain us in those conditions which are requisite to the development of our rational capacities. This noble earth whereon we dwell—this splendid environment of air and ocean—this gorgeous firmament of space wherein the sun goeth forth in power, and stars shed down their radiance—these wide-spread realms of plain and valley, the caves and storehouses of the globe which yield their rich contents to human ingenuity and exertion—the whole visible economy and adaptations of the world have a practical relation to the wants and conveniences of man, and were evidently designed for his service and delight. But yet the worth of the world as a commodity for human uses cannot be rightfully regarded as otherwise than secondary, and instrumental to the spiritual progression of the intelligent beings whom it supports.

Yes, the attainment of a spiritual wellbeing is the true success of life. The most stupendous realisations of earthly benefit and splendour cannot avail to render a man intrinsically great or noble: they are but as a gaudy and tinsel vesture for his worthlessness, if the soul within him be not shining with intelligence and goodness. This is the most lamentable poverty in the world—that a man be base and mean in spirit; that he understand not the things which make the lustre of humanity. To dwell proudly or meekly among sumptuous externalities, and to count the acquisition of these as the utmost aim and purpose of existence, is an abdication of a man's lordliest prerogatives—a virtual surrendering of whatsoever is best and highest in his nature, an unintelligent relinquishment of his noblest estate. For what—after filling himself to repletion with all sensuous enjoyments, after gathering up the fulness of delight which opportunity and opulence can yield—what true and indestructible advantage has he realised? It is well to think of this—well to understand and lay to heart that only a temporary and no permanent or sufficing good can be derived from them. It was known long ago, but it is never sufficiently remembered, that a man's

blessedness consists not in the multitude of his possessions, nor in any of the gratifications of sense or appetite, but in a well-ordered mind and disposition, in a reverent recognition of his spiritual and immortal interests, in a wise obedience to the laws of his moral nature. That which constitutes his pre-eminent distinction, is the intellectual and moral power which is centred in his being. No wealth of external means can supply the want or loss of insight or of purity in the soul. A man's first vocation is his call to be a man—a truthful, reasonable being, working in unison with the Supreme Intelligence for ends answerable to the aims of the creation. He should know the end for which he is alive: that the thing which most intimately concerns him is the maintenance of a discerning and upright spirit. Not in pleasure, not in ease, not in any outward appliances of affluence or conventional repute, not in the ranks of public glory or advantage—not in any of these things will he find his welfare; but only in a free and perfect development of his natural and especial character. Thus alone can he fulfil his proper destiny, and adequately justify his appearance in the world.

The highest consideration, then, for every man, is the cultivation of his faculties for the ends of personal virtue. It is that the soul may grow in strength and moral beauty—that the man may ascend with his days to loftier and nobler stages of spiritual perfection—that he may outlive his weaknesses and errors, and grow more and more into likeness and relation with the bright design prefigured to his hopes as the attainable destination of his humanity. It is for this that his life was given him; for this was he exalted in form and in capacity above all other shapes of sentient being in the world—that he might live and act in the world as an incarnate testimony of the presence of the great Divinity which rules for ever at the heart of things. 'The foundations of man,' it has been said, 'are not in matter, but in spirit; and the element of spirit is eternity.' When his powers are trained and disciplined for large and universal objects, instead of for the production of a private and selfish benefit—when he discerns the high celestial ancestry of the attributes embodied in his personality, and aims to give effect to all the clear commands of conscience—then shall he witness the full triumph of his energies. Hereby shall he attain to a true and permanent success, the elements whereof shall never perish, but be borne forwards, in the march of progress, to remotest generations, and combine and harmonise with the eternal workings of the universe.

THE DESERTED HOUSE.

HAVING been detained by the illness of a relative at the small town of Beziers, when travelling a few years since in the south of France, and finding time hang somewhat heavily on my hands during the slow progress of my companion's convalescence, I took to wandering about the neighbourhood within a circle of four or five miles, inspecting the proceedings of the agriculturists, and making acquaintance with the country people. On one of these excursions, seeing a high wall and an iron gate, I turned out of my road to take a peep at the interior through the rails; but I found them so overgrown with creepers of one sort or another, that it was not easy to distinguish anything but a house which stood about a hundred yards from the entrance. Finding, however, that the gate was not quite closed, I gave it a push; and although it moved very stiffly on its hinges, and grated along the ground as it went, I contrived to force an aperture wide enough to put in my head. What a scene of desolation was there! The house, which was built of

dark-coloured bricks, looked as if it had not been inhabited for a century. The roof was much decayed, the paint black with age, the stone-steps green with moss, and the windows all concealed by discoloured and dilapidated Venetian blinds. The garden was a wilderness of weeds and overgrown rose-bushes; and except one broad one, in a right line with the main-door of the house, the paths were no longer distinguishable. After surveying this dismal scene for some time, I came away with a strange feeling of curiosity. 'Why should this place be so entirely deserted and neglected?' thought I. It was not like a fortress, a castle, or an abbey, allowed to fall into ruins from extreme age, because no longer appropriate to the habits of the period. On the contrary, the building I had seen was comparatively modern, and had fallen to decay merely for want of those timely repairs and defences from the weather that ordinary prudence prescribes. 'Perhaps there is some sad history attached to the spot,' I thought; 'or perhaps the race to whom it belonged have died out; or maybe the cause of its destruction is nothing more tragical than a lawsuit!'

As I returned, I inquired of a woman in the nearest village if she could tell me to whom that desolate spot belonged.

'To a Spaniard,' she answered; 'but he is dead!'

'But to whom does it belong now?' I asked. 'Why is it suffered to fall into ruin?'

'I don't know,' she said, shaking her head, and re-entering the hovel, at the door of which she had been standing.

During dinner that day I asked the host of the inn if he knew the place, and could satisfy my curiosity. He knew it well, he answered. The last inhabitant had been a Count Ruy Gonzalez, a Spaniard, whose wife had died there under some painful circumstances, of which nobody knew the particulars. He had been passionately fond of her, and immediately after her decease had gone to reside in Paris, where he had also died. As the place formed part of the lady's fortune, it had fallen into the hands of some distant relation of hers, who had let it; but the tenant, after a residence of a few months, left it, at some sacrifice of rent; and other parties who subsequently took it having all speedily vacated under one pretext or another, an evil reputation gathered round and clung to it so tenaciously, that all idea of occupation had been relinquished.

It may be conceived that this information did not diminish my interest in the deserted house; and on the following day I was quite eager to see my invalid settled for her mid-day slumber, in order that I might repeat my visit, and carry my investigations further. I found the gate ajar as before, and by exerting all my strength, I managed to force my way in. I had not gone three steps before a snake crossed my path, and the ground seemed actually alive with lizards; but being determined to obtain a nearer view of this mysterious house, I walked straight on towards it. A close inspection of the front, however, shewing me nothing but what I had described from a distance, I turned to the left, and passed round to the back of the building, where I found the remains of what had been a small flower-garden, with a grass-plot; and beyond it, divided by a wall, a court surrounded by mouldy-looking stabling: but, what was much more interesting, I discovered an open door leading into the

house. Somebody, therefore, must surely be within; so I knocked with my parasol against the panel, but nobody came; and having repeated my knock with no better success, I ventured in, and found myself in a stone passage, terminating in a door, which, by a feeble light emitted through it, I saw was partly of glass.

'Anybody here?' I said aloud, as I opened it and put in my head; but all was silent: so I went forward, not without some apprehension, I confess; but it was that sort of pleasing terror one feels when witnessing a good melodrama. I was now in a tolerably-sized hall, supported by four stone pillars, and on each side of it were two doors. I spoke again, and knocked against them, but nobody answered; then I turned the handles. The first two I tried were locked, but the third was not. When I saw it yield to my hand, I confess I felt so startled that I drew back for a moment; but curiosity conquered—I looked in. The dim light admitted by the Venetian blinds shewed me a small apartment, scantily furnished, which might have been a *salon* or an ante-room. Two small tables standing against the wall, a few chairs covered with yellow damask, and a pier-glass, were all it contained; but at the opposite end there was another open door: so, half-pleased and half-frightened, I walked forward, and found myself in what had formerly been a prettily-furnished boudoir. Marble slabs, settees covered with blue velvet, chairs and curtains of the same, and three or four round or oval mirrors in elaborately-carved gilt frames, designated this as the lady's apartment. A third door, which was also open, shewed me a bed in an alcove, with a blue velvet dais and a fringed counterpane of the same material. Here I found a toilet-table, also covered with what had once been white muslin, and on it stood several china boxes and bottles. In one of the former there were some remains of a red powder, which appeared to have been rouge; and on lifting the lid of another I became sensible of the odour of musk. The looking-glass that stood on the table had a drapery of muslin and blue bows round the frame; and the old-fashioned mahogany chest of drawers was richly gilt and ornamented. None of these rooms was papered; all appeared to be plastered or stuccoed, and were elaborately adorned with designs and gilt mouldings, except in one place, which seemed to have formerly been a door—the door of a closet probably; but it was now built up—the plaster, however, being quite coarse and unadorned, and not at all in keeping with anything else in the room. It was also broken, indented, and blackened in several places, as if it had been battered with some heavy weapon. Somehow or other, there was nothing that fixed my attention so much as this door! I examined it—I laid my hand upon it. Why should it have been so hastily built up to the disfigurement of the wall?—for the coarseness of the plaster and the rudeness of the work denoted haste. I was standing opposite to it, and asking myself this question, when I heard a heavy foot approaching; and before I had time to move, I saw the astonished face of an elderly man in clerical attire standing in the doorway. I believe he thought at first I was the ghost of the former inhabitant of this chamber, for he actually changed colour and stepped back.

'Pardon, mon père!' said I, smiling at his amazement: 'I found the door open; and I hope you will excuse the curiosity that has led me to intrude?'

'Une Anglaise!' said he bowing; 'a traveller, doubtless. You are the first person besides myself that has entered these apartments, madame, for many a long year, I assure you!'

After giving him an explanation of how I came to be there—an explanation which he listened to with much kindness and placidity—I added, that the appearance of the place, together with the little information I had gathered from the host of the inn, had interested me exceedingly. He looked grave as I spoke. I was about to

question him regarding the closed door, when he said—'I do not recommend you to remain long here: the house is very damp; and as the windows are never opened, the air is unwholesome.' I did not know whether this was an excuse to get rid of me; but the atmosphere was certainly far from refreshing, and at all events I thought it right to accept the intimation; so I accompanied him out, he locking the doors behind him. As we walked along, he told me that he visited the house every day, or nearly so; and that he had never thought of shutting the gate, since nobody in the neighbourhood would enter it on any account. This gave me an opportunity of inquiring into the history of the place, which, if it were not impertinent, I should be very glad to learn. He said he could not tell it me then, having a sick parishioner to visit; but that if I would come on the following day, at the same hour, he would satisfy my curiosity. I need not say that I kept the appointment; and as I approached the garden gate, I saw him coming out.

'A walk along the road would be more agreeable than that melancholy garden,' he said; 'and, if I pleased, he would escort me part of the way back.' So we returned, and after a few desultory observations, I claimed his promise.

'The house,' he said, 'has never been inhabited since I came to live in this neighbourhood, though that is now upwards of forty years since. It belonged to a family of the name of Beaugency, and the last members of it who resided here were a father and daughter. Henriette de Beaugency she was called; a beautiful creature, I have been informed, and the idol of her father, whose affection she amply returned. They led a very retired life, and seldom quitted the place, except to pay an annual visit to the other side of the Pyrenees, where she had an elder brother married to a Spanish lady of considerable fortune; but Mlle Henriette had two companions who seemed to make her amends for the absence of other society. One was a young girl called Rosina, who had been her foster-sister, and who now lived with her in the capacity of waiting-maid; the other was her cousin, Eugène de Beaugency, an orphan, and dependent on her father; his own having lost everything he possessed, in consequence of some political offence previous to the Revolution. It was even reported that the Beaugency family had been nigh suffering the same fate, and that some heavy fines which had been extracted from them had straitened their means, and obliged them to live in retirement. However this might be, Henriette appeared perfectly contented with her lot. Eugène studied with her, and played with her; and they grew up together with all the affection and familiarity of a brother and sister; whilst old M. de Beaugency never seems to have suspected that any other sentiment could possibly subsist between them: not that they took the slightest pains to disguise their feelings; and it was their very openness that had probably lulled the father's suspicions. Indeed, their lives flowed so smoothly, and their intercourse was so unrestrained, that nothing ever occurred to awaken even themselves to the nature of their sentiments; whilst the affection that united them had grown so gradually under the parent's eyes, that their innocent terms of endearment, and playful caresses, appeared to him but the natural manifestations of the relation in which they stood to each other. The first sorrow Henriette had was when Eugène was sent to Paris to study for the bar; but it was a consolation that her own regret scarcely exceeded that of her father; and when she used to be counting the weeks and days as the period of his return drew nigh, the old man was almost as pleased as she was to see their number diminish.

'All this harmony and happiness continued uninterrupted for several years; but at length an element of discord, at first slight, seemed to arise from the appear-

ance on the scene of a certain Count Ray Gonzalez, who came here with the father and daughter after one of their annual excursions into Catalonia. He was an extremely handsome, noble-looking Spaniard, of about thirty years of age, and said to be rich; but there was an air of haughty, inflexible sternness about him, that repelled most people, more than his good looks and polished manners attracted them. These unamiable characteristics, however, appeared to be much modified, if not to vanish altogether, in the presence of Mlle de Beaugency, to whom it soon became evident he was passionately attached; whilst it was equally clear that her father encouraged his addresses. Even the young lady, in spite of her love for her cousin, seems to have been not quite insensible to the glory of subduing this magnificent Catalonian, who walked the earth like an archangel in whom it was a condescension to set his foot on it. She did not, therefore, it is to be feared, repress his attentions in the clear and decided manner that would have relieved her of them—though, indeed, if she had done so, considering the character she had to deal with, the *dénouement* might not have been much less tragical than it was. In the meanwhile, pleased and flattered, and joyfully anticipating her cousin's return, she was happy enough; for the pride of the Spaniard rendering him cautious to avoid the possibility of refusal or even hesitation in accepting him, he forebore to make his proposal till the moment arrived when he should see it eagerly desired by her. All this was very well till Eugène came home; but then the affair assumed another colour. Love conquered vanity; and the Spaniard, finding himself neglected for the young advocate, began to exhibit the dark side of his character; whereupon the girl grew frightened, and fearing mischief, she tried to avert it by temporising—leading the count to believe that the affection betwixt herself and her cousin was merely one of early habit and relationship; whilst she secretly assured Eugène of her unalterable attachment. So great was her alarm, that she tacitly deceived her father as well as the Spaniard; and as the latter seemed resolved not to yield his rival the advantage his own absence would have given him, she was actually rejoiced when the period of her cousin's visit expired.

'The young man gone, Ray Gonzalez resumed his former suavity of manner; and as he possessed many qualities to recommend him in a lady's eyes, he might possibly have won her heart had it been free; but as the matter stood, she ardently desired to get rid of him, and waited anxiously for the moment when he would give her an opportunity of declining his hand, trusting that would be the signal for his final departure. But whether from caution, or because he had penetrated her feelings, the expected offer was not made, although he assiduously continued his attentions, and spent more of his time at her house than at his own in Catalonia. At length Mlle de Beaugency began to apprehend that he intended to wait the result of his observations at her cousin's next visit; and feeling quite assured that if the rivals met again, a quarrel would ensue, she persuaded her father to select that season for their own visit to her brother; whilst she wrote to Eugène, excusing their absence, and begging him not to come to see her at present. It is true, all this was but putting off the evil day; but she had a presentiment of mischief, and did not know what to do to avert it; the rather that she was aware both her father and brother wished to see her married to the count, and that neither of them would consent to her union with Eugène, who had no means of supporting her, nor was likely to have for some years to come. It was not to be expected that this arrangement should be agreeable to the young lover; it was now his turn to be jealous; and instead of staying away as he was desired, he set out post-haste with the fixed determination of following them from their residence to Catalonia, and

coming to an immediate explanation with the count. But his jealous pangs were appeased, and all thoughts of revenge postponed, by finding his uncle at the last extremity, his mistress in great distress, and Ruy Gonzalez not with them. Their journey had been prevented by the sudden seizure of M. de Beaugency, who, after a few days' suffering, expired in his daughter's arms, quite ignorant of her attachment to her cousin, and with his dying breath beseeching her to marry the count. When his affairs began to be looked into, the motive for this urgency became apparent. He had been living on the principal of what money he had; and nearly all that remained of his dilapidated fortunes was this house and the small piece of ground attached to it. This was a great disappointment to the young couple, who, previous to their discovery, had agreed to be married in six months—the lady believing her fortune would be sufficient to maintain them both. But now marriage was out of the question till Engène had some means of maintaining her. At present, he had nothing; he was an advocate without a brief, and had been hitherto living on the small stipend allowed by his uncle; starving himself three quarters of the year, in order that he might have the means of spending the other quarter at the Beaugency mansion. And what a long time might elapse before he could make anything by his profession! It was, as they both agreed, *désespérant*.

These events occurred in the early years of the French Republic, when France was at war with all the world, and soldiering the best trade going. "I'll enter the army," said Engène; "it is the profession I always preferred, and that for which I have most talent, and the only one in these times by which a man can hope to rise rapidly. At the bar I may wait for years without getting anything to do. Besides, I am intimate with a son of General Duhamel's; and I know he will speak a good word for me, and get his father to push me on." Of course there were objections to this plan on the part of Henriette, but her lover's arguments overcame them; and after repeated vows of fidelity, they parted, he to fulfil his intentions, and she to remain at home with Rosina and an elderly female relative who came to live with her—a plan she preferred to accepting her brother's invitation to reside with him in Catalonia, where she would have been exposed to the constant visits of the count: whereas, now that her father was dead, he could not with propriety visit her at her own house. It appeared afterwards that he had only been deferring his proposals till what he considered a decorous moment for making them; being meanwhile assured of the brother's support, and having little doubt of being accepted since the state of M. de Beaugency's affairs was disclosed. But before that moment came, a circumstance occurred to facilitate his views, in a manner he little expected; for, eager to distinguish himself under the eye of his commanding officer, Eugene de Beaugency, with the ardour and inexperience of youth, had rushed into needless danger, and fallen in the very first battle his regiment was engaged in.

By the time my companion had reached this point in his narration, we found ourselves at the entrance of the village, where the church stood, and beside it the small house occupied by the curé. It had a little garden in front, and under the porch sat a very ancient woman, basking in the sun. Her head shook with palsy, her form was bent, and she had a pair of long knitting-needles in her hands, from her manner of using which I perceived she was blind. The priest invited me to walk in, informing me that that was Rosina; and adding, that if I liked to rest myself for half an hour, he would ask her to tell me the rest of the story. Feeling assured that some strange catastrophe remained to be disclosed, I eagerly accepted the good man's offer; and having been introduced to Henriette's former companion, whose

memory, in spite of her great age, I found perfectly clear, I said I feared it might give her pain to recall circumstances that were doubtless of a distressing nature.

"Ah, madame," said she, "it is but putting into words the thoughts that are always in my head! I have never related the sad tale but twice; for I would not, for my dear mistress's sake, speak of such things to the people about her; but each time I slept better afterwards. I seemed to have lightened the heaviness of my burthen by imparting the secret to another."

"You were very much attached to Mlle de Beaugency?" said I.

"My mother was her nurse, madame, but we grew up like sisters," answered Rosina. "She never concealed a thought from me; and the Virgin knows her thoughts will never keep me an hour out of Paradise, for there was no more sin in them than a butterfly's wing might bear."

"I suppose she suffered a great deal when she heard of her cousin's death?" said I. "How long was it before she married the count? For she did marry him, I conclude, from what I have heard?"

"Ay, madame, she did, about a year after the—the news came, worse luck! Not that she was unhappy with him exactly. He did not treat her ill; far from it; for he was passionately fond of her. But he was jealous—heaven knows of whom, for he had nobody to be jealous of. But he loved like a hot-blooded Spaniard, as he was; and I suppose he felt that she did not return his love in the same way. How should she, when she had given her whole heart to her cousin? Still she liked the count, and I could not say they were unhappy together; but she did not like Spain, and the people she lived amongst there. The count's place was dreadfully gloomy certainly. For my part, I used to be afraid to go at night along the vaulted passages, and up those wide dark staircases, to my bed. But the count doted on it because it had belonged to the family time out of mind; and it was only to please her that he ever came to her family home at all."

"But surely this place is very dismal too?" said I.

"Dismal!" said she. "Ay, now, I daresay, because there's a curse on it; but not then. Oh, it was a pleasant place in old M. de Beaugency's time! Besides, my poor mistress loved it for the sake of the happy days she had seen there; and when the period approached that she was to be confined of her first child, she entreated her husband to bring her here. She wanted to have my mother with her, who had been like a mother to her; and as she told him she was sure she should die if he kept her in Catalonia, he yielded to her wishes, and we came. The doctor was spoken to, and everything arranged; and she was so pleased, poor thing, at the thoughts of having a baby, that as we used to sit together making the clothes for the little creature that was expected, she chatted away so gaily about what she would do with it, and how we should bring it up, that I saw she was now really beginning to forget that she was not married to the husband her young heart had chosen."

"Well, madame," continued Rosina, after wiping her sightless eyes with the corner of her white apron—"we were all, as you will understand, happy enough, and looking forward shortly to the birth of the child, when, one afternoon, whilst my master and mistress were out driving, and I was looking through the rails of the garden gate for the carriage—for they had already been gone longer than usual—I saw a figure coming hastily along the road towards where I stood, a figure which, as it drew near, brought my heart into my mouth, for I thought it was an apparition! I just took a second look, and then, overcome with terror, I turned and ran towards the house; but before I reached it, he had opened the gate, and was in the garden."

"Who was?" said I.

"M. Eugène, madame—Eugène de Beaugency, my lady's cousin," answered Rosina. "Rosina!" cried he, "Rosina! don't be frightened. I'm no ghost, I assure you. I suppose you heard I was killed? But I was not, you see; I was only taken prisoner, and here I am, alive and well, thank God! How's my cousin? Where is she?"

"I leave you to judge, madame, how I felt on hearing this," continued the old woman. "A black curtain seemed to fall before my eyes, on which I could read *Wo! wo! wo!* I could not tell what form it would take; I never could have guessed the form it did take; but I saw that behind the dark screen which veiled the future from my eyes there was nothing but *wo* on the face of the earth for those three creatures. The Lord have mercy upon them! thought I; and for the world to come, I hope my prayer may have been heard—but it was of no avail for this!

"Well, madame, my first fear was, that the count would return and find him there, for well I knew there would be bloodshed if they met; so without answering his questions, I entreated him to go away instantly to my mother's, promising that I would follow him presently, and tell him everything; but this very request, together with the agitation and terror he saw me in, made him suspect the truth at once; and seizing my arm with such violence that I bore the marks of his poor fingers for many a day afterwards, he asked me if she was married. "She is," said I: "she thought you were dead; she had no money left; and you know it was her father's dying injunction that"—"Married to the Spaniard—to Ruy Gonzalez?" said he, with such a face, the Lord deliver me!" (and the old woman paused for a moment, as if to recover from the pain of the recollection.) "Yes," said I, "to Ruy Gonzalez; and if he sees you here, he'll kill you!" "Let him!" said he, "But it will be her death," said I; "and she's—she's"—I hadn't the heart to go on. "What?" said he.

"In the family way—near her confinement," I answered. He clenched his two fists and clapped them on his forehead. "I must see her," said he. "Impossible!" I answered; "he never leaves her for a moment." "Where are they now?" he asked. "Out driving," said I. "In a dark-blue carriage?" "Yes; and I expect them every minute. Go, go, for the Lord's sake, go to my mother's!" "I saw the carriage," said he with a bitter smile. "It passed me just this side of Noirmoutier. Little I thought"—and his lip quivered for a moment, and his features were convulsed with agony. "I will, I must see her," continued he; "and you had better help me to do it, or it will be the worse for us all. Hide me in her room; he does not sleep there, I suppose?" "No," I replied; "but he goes there often to talk to her when she is dressing." "Put me in the closet," said he; "there's room enough for me to crouch down under the bookshelves. You can then tell her; and when he has left her for the night, you can let me out." "My God!" I cried, my knees beginning to shake under me, "I hear the carriage; they'll be here in an instant!" "Do as you like!" said he, seeing the advantage this gave him: "if you won't help me to see her, I'll see her without you. I shall stay where I am!" and he struck his cane into the ground with a violence that shewed his resolution to do what he threatened. "Come away, for the Lord's sake!" cried I, for the carriage was close at hand, and there was not a moment to spare; and seizing him by the arm, I dragged him into the house; for even now he was half inclined to wait for them, and I saw he was burning to quarrel with the count. Well, I had but just time to lock him into the closet, and put the key in my pocket, before they had alighted, and were walking up the garden.

"You may conceive, madame, the state I was in when I met the count and my lady; and my confusion was not diminished by finding that he observed it. "What

is the matter, Rosina?" said he; "has anything unusual happened?" and as he spoke he fixed his dark, piercing eyes upon me in such a way that I felt as if he was reading my very thoughts. I affected to be busy about my mistress, keeping my face away from him; but I knew he was watching me for all that. Generally, when they came home, he used to retire to his own apartment, and leave his wife with me; but now he came into the *salon*, took off his hat, and sat himself down; nor did he leave her for two minutes during the whole evening. This conduct was so unusual, that it was plain to me he suspected something; besides, I saw it in his countenance, though I did not know whether his suspicions had been roused by my paleness and agitation, or whether anything else had awakened them; but I felt certain afterwards that he had seen the poor young man when the carriage passed him; or, at least, been sufficiently struck with the resemblance to put the true interpretation on my confusion. Well, madame, you may imagine what an evening I spent. I saw clearly that he was determined not to leave me alone with his wife; but this was not of so much consequence, since I had resolved not to give her a hint of what had happened till the count had taken leave of her for the night, because I knew that her agitation would have betrayed the secret. In the meanwhile she suspected no mischief; for although she observed something was wrong with me, she supposed I was suffering in my mind about a young man I was engaged to marry, called Philippe, who had been lately ill of a fever, and was now said to be threatened with consumption.

"Whilst I pretended to be busy myself in my lady's room, they went out to take a stroll in the garden; and when I saw them safe at the other end, I put my lips to the keyhole, and conjured Eugène, for the sake of all that was good, to be still; for that I was certain it would not only be his death, but my mistress's too, if he were discovered; and he promised me he would. I had scarcely got upon my feet again, and turned to open a drawer, when I heard the count's foot in the *salon*. "The countess is oppressed with the heat," said he, "and wants the large green fan: she says you'll find it on one of the shelves in the closet."

"Only think, madame! only think!" said Rosina, turning her wrinkled face towards me, and actually shaking all over with the recollection of her terror. "I thought I should have sunk into the earth! I stood for a moment aghast, and then I began to fumble in my pocket. "Where can the key be?" said I, pretending to search for it; but my countenance betrayed me, and my voice shook so, that he read me like a book. I am sure he knew the truth from that moment. He looked hard at me, whilst his face became quite livid; and then he said in a calm deep voice: "For the fan, no matter; I'll take another; but I see you are ill: you have caught Philippe's fever; you must go to bed directly. Come with me, and I'll lead you to your room." "I am not ill, Monsieur le Conte," I stammered out; but taking no notice of what I said, he grasped my arm with his powerful hand, and dragged me away up stairs; I say dragged, for I had scarcely strength to move my feet, and it was rather dragging than leading. As soon as he had thrust me into the room, he said in a significant tone: "Remember you are in danger! Unless you are very prudent, this fever will be fatal. Go to bed, and keep quite still till I come to see you again, or you may not survive till morning!" With that he closed the door, and locked it; and I heard him take out the key, and descend the stairs. Then I suppose I swooned; for when I came to myself it was nearly dark; I was lying on the floor, and could not at first remember what had happened. When my recollection returned, I crawled to the bed, and burying my face in the pillows, I gave vent to my anguish in sobs and tears; for I loved my mistress, madame, and I

loved M. Eugène, and I knew there would be deadly mischief amongst them. I expected that the count would break open the closet, and that one or both would be killed; and considering the state she was in, I did not doubt that the grief and fright would kill the countess also. You may judge, madame, what a night I passed! sometimes weeping, sometimes listening; but I could hear nothing unusual; and at length I began to fancy that the conflict had occurred whilst I was lying in the swoon. But how had it terminated? I would have given worlds to know; but there I was, a prisoner, and I feared that if I tried to give any alarm, I might only make bad worse.

'Well, madame, I thought the morning would never break; but at length the sun rose, and I heard people stirring. It seemed, indeed, that there was an unusual bustle and running about; and by and by I heard the sound of wheels and horses' feet in the court, and I knew they were bringing out the carriage. Where could they be going? I could not imagine; but, on the whole, I was relieved, for I fancied that the meeting and explanation were over, and that now the count wished to leave the house, which, under the circumstances, I could not wonder at. He has spared Eugène for her sake, thought I. And this belief was strengthened by my master's entering my room presently afterwards, and saying, "Your mistress is gone away; I am afraid of her taking this fever. When I think it proper, you shall be removed: till then, remember that your life depends on your remaining quiet!" He placed a loaf of bread and a carafe of water on the table, and went away, locking the door as before. I confess now that much as I felt for M. Eugène, I could not help pitying the count also. What ravages the sufferings of that night had made on him! His cheeks looked hollow, his eyes sunken, his features all drawn and distorted, and his complexion like that of a corpse. It was a dreadful blow to him certainly, for I knew that he loved my mistress to madness.

'Well, madame, I passed the day more peacefully than I could have hoped; but my mind being somewhat relieved about my lady, I began to think a little of myself, and to wonder what the count meant to do with me. I felt certain he would never let me see her again if he could help it, and that alone was a heart-breaking grief to me; and then it came into my head that perhaps he would confine me somewhere for life—shut me up in a convent perhaps, or a madhouse! As soon as this idea possessed me, it grew and grew till I felt as if I really was going mad with the horror of it; and I resolved, though it was at the risk of breaking my neck, to try and make my escape by the window during the night. It looked to the side of the house, and was not very high up; besides, there were soft flower-beds underneath to break my fall; so I thought by tying the sheets together, and fastening them to an iron bar that divided the lattice, I might reach the ground in safety. I was a little creature, and though the space was not large, it sufficed for me to get through; and when all was quiet, and I thought everybody was in bed, I made the attempt, and succeeded. I had to jump the last few feet, and I was over my ankles in the soft mould; but that did not signify—I was free; and taking to my heels, I ran off to my mother's, who lived then in a cottage hard by, where we are now sitting; and after telling her what had happened, it was agreed that I should go to bed, and that if anybody came to inquire for me she should say I was ill of the fever, and could not be seen. I knew when morning came I should be missed, for doubtless the count would go to my room; and besides that, I had left the sheets hanging out of the window.

'For two days, however, to my great surprise, we heard nothing; but on the third, Philippe (the young man I was engaged to) hearing I was not at the Beaugency house, came to our cottage to inquire about me.

We had not met for some time, the countess having forbidden all communication between us, as she had a horrible dread of the fever, so that he could only hear of me through my mother. "Rosina is here, and unwell," said my mother: "we think she's got the fever;" for though we might have trusted Philippe with our lives, we thought it would be safer for him to be ignorant of what had happened. Upon this he begged leave to see me; and she brought him into my chamber. After asking about himself, and telling him I was very poorly, and so forth, he said: "This is a sad thing for the countess!" "What is?" I asked. "You're being ill at this time," said he, "when she must want you so much." "What do you mean?" said I; "the countess is not at the house?" "Don't you know she's come back," said he, "and that she's ill?" The doctor has been sent for, and they say she's very bad." "Gracious heavens!" I exclaimed; "is it possible? My poor dear mistress ill, and I not with her!" "Robert, the footman, says," continued Philippe—"but he bade me not mention it to anybody—that when they stopped at the inn at Montlouis, Rateau the landlord came to the carriage-door, and asked if she had seen M. Eugène de Beaugency; and that when the countess turned quite pale and said, 'Are you not aware my cousin was killed in battle, M. Rateau?' he assured her it was no such thing; for that M. Eugène had called there shortly before on his way to her house. Rateau must have taken somebody else for him of course; but I suppose she believed it, for she returned directly." "Rateau told her that he had seen M. Eugène?" said I. "So Robert says; but Didier the mason says she was ill before she went, and that it was the rats in the closet that frightened her." "Rats!" said I, sitting up in my bed and staring at him wildly. "What rats?—what closet?" "Some closet in her bedroom," said he. "The count sent for Didier to wall it up directly." "To wall it up?—wall up the closet?" I gasped out. "Yes, build and plaster it up. But what's the matter, Rosina? Oh, I shouldn't have told you the countess was ill!" he cried out, terrified at the agitation I was in. "Leave me in the name of God!" I screamed, "and send my mother to me!"

'I remember nothing after this, madame, for a long, long time. When my mother came, she found me in my night-clothes, tying the sheets together in order to get out of the window, though the door was wide open; but I was quite delirious. Weeks passed before I was in a state to remember or comprehend anything. Before I recovered my senses, my poor mistress and her baby were in the grave, my master gone away, nobody knew whither, the servants all discharged, and the accursed house shut up. Not long afterwards the news came that the count had died in Paris.'

'But, Rosina,' said I, 'are you sure that M. de Beaugency was in that closet? How do you know the count had not first released him?'

'Ah, madame,' she replied, ominously shaking her palsied head, 'you would not ask that question if you had known Ruy Gonzalez as I did. The moment the words were out of Philippe's mouth I saw it all. It was just like him—just the revenge for that stern and inflexible spirit to take. Besides, madame, when all was over, and he durst speak, Didier the mason told me that nothing should ever convince him that there was not some living thing in that closet at the time he walled it up, though who or what it could be he never could imagine.'

'And do you think, Rosina,' said I, 'do you think the countess ever suspected the secret of that dreadful closet?'

'Ay did she, madame,' answered she; 'and it was that which killed her; for when my mistress came back so unexpectedly, the count was closeted up stairs with his agent, making arrangements for quitting the place

for ever, and had given orders not to be disturbed. He had locked up her apartments, and had the key in his pocket; but he had forgotten that there was a spare key for every room in the house, which the housekeeper had the charge of; so my lady sent for her to open the doors. Now, though from putting this and that together—the count's agitation, my sudden disappearance, her own removal, and the innkeeper's story—she felt sure there was some mischief in the wind, she had no suspicion of what had really occurred; as indeed how should she, till her eyes fell upon the door of the closet. Then she comprehended it all. You may imagine the rest, madame! Words couldn't paint it! When they came into the room, she was battering madly at the wall with the poker. But a few hours terminated her sufferings. She was already dead when Philippe was telling me of her return.

'It's a fearful tragedy to have lived through!' said I. 'And Philippe: what became of him?'

'He died like the rest, madame, about six months after these sad events had occurred. When I recovered my health, I went into service, and for the last forty years I have been housekeeper to M. le Curé here.'

'And he is the only person that ever enters that melancholy house?'

'Yes, madame. I went there once—just once—to look at that fatal chamber, and the bed where my poor mistress died. When the place was let, those apartments were locked up; but—and she shook her head mournfully—'the tenants were glad to leave it.'

'And for what purpose does M. le curé go there so often?' I asked.

'To pray for the souls of the unfortunates!' said the old woman, devoutly crossing herself.

Deeply affected with her story, I took leave of this sole surviving witness of these long-buried sorrows; and I, too, accompanied by the curé, once more visited the awful chamber. 'Ah, madame!' said he, 'poor human nature! with its passions, and its follies, and its mad revenges! Is it not sad to think that so much love should prove the foundation of so much woe?'

THE LINEN MANUFACTURE.

A short time ago we spoke of the surprisingly rapid growth of the cotton manufacture, that has within a few years risen to be the great staple of British industry, and any temporary depression of which shakes the very fabric of society. The manufacture which has attained these gigantic dimensions is usually supposed to have prospered only by the undue depression of the more ancient trade in linen. Judging from various circumstances, it is perhaps not unreasonable to think so, and yet, when the subject comes to be examined, nothing is found to be further from the truth.

Cotton is a woolly substance produced in the pod of a tropical plant. Flax, on the other hand, is the finer portion of the fibres of flint; a vegetable which grows in almost any part of the world, and more particularly in high northern or southern latitudes. Russia, Prussia, and the Netherlands are the chief flint-producing countries in continental Europe, and the quantity raised in Ireland is very considerable, amounting this year to nearly 2500 tons. New Zealand appears to possess a soil and climate suitable for flax; and thence large supplies may ultimately be procured. Latterly, the growing scarcity and enhanced price of cotton, and the diminished price of grain, have induced an attempt to cultivate flint on an extended scale in England; but it may be doubted if the effort will prove so successful as is generally anticipated. Great labour and attention are required in the preparation of the crop, and consequently unless where labour is cheap, and time of comparatively small value, there will be a serious obstacle to its profitable culture.

No account being taken of the flax produced throughout the British islands, it is impossible to present an accurate view of the total quantity used in the linen manufacture. Whatever be the amount of home growth, it is inadequate to meet the demand of manufacturers. It appears that the quantity of foreign flax imported in 1849 was 90,340 tons, and in 1850 it was 91,097 tons—a quantity believed to be more than treble what is produced in Great Britain and Ireland. The consumption of so vast an amount of flax is owing not more to the demand for linen fabrics than the advanced state of mechanical appliances. So long as there were no other means of hackling—that is, separating the flax from the tow or coarse fibres of the lint—than by hand labour, no other method of spinning than by the small domestic wheel, and no other species of weaving than by the common loom, the linen manufacture remained on an insignificant scale. It may be added, that so long as bounties were given by government on the export of the manufactured article, little good was done, even with improved means. The policy of recent times, which throws every man on his own enterprise, along with the introduction of machinery in all departments, have revolutionised the linen trade; and now it assumes an exceedingly important place in the national economy.

Nothing is more curious in the history of industry than the manner in which a manufacture takes root in a particular locality. The seat of the cotton manufacture is on the west side of Great Britain, in the vicinity of ports on the Atlantic, by which the material is chiefly introduced; that of the linen trade is on the east, a ready access from the Baltic having probably determined the point. From the beginning of a small trade, carried on with the domestic loom, the manufacture of linen of various qualities has grown to huge proportions in Fife and Forfarshires, in the east of Scotland. The quantity of flax imported at Hull for the Yorkshire factories last year was 14,288 tons. At Dundee, the quantity was as much as 40,450 tons, including flax tow; and at Kirkcaldy, Arbroath, and Montrose, it was 17,395 tons. Dundee, therefore, has come to be the largest importer of the material; and what it receives it works up on the spot, about half for home consumption, and half for exportation. A few words respecting this branch of manufacture in Dundee may prove interesting.

So late as 1814, the whole of the flax imported into Dundee amounted to only 3000 tons; it has just been shewn to be now above 40,000 tons. The coarser qualities of goods—as sail-cloth, bagging, &c. also linen yarns—are chiefly produced here; and for the greater part in connection with extensive establishments provided with steam-power. These establishments are as imposing in appearance as the cotton factories of Manchester or the woollen mills of Leeds. At present, there are in Dundee 43 spinning-mills, with steam-engines of an aggregate of 2075 horse-power; and 8 power-loom factories, possessing 235 horse-power—altogether 51 establishments with machinery moved by steam. The spinning-mills employ much the greater number of hands; but including the whole 51 establishments, there are employed in various occupations 3240 males, and 8142 females, making a total of 11,382 persons. Of these, only 202 are under 13 years of age. We have ascertained that the money wages distributed among this large body of individuals amounts to about £3900 per week; the payment to the male operatives being on an average 9s. 6d., and to females 6s., weekly. Besides the power-loom factories, the town possesses 62 establishments of one kind or other using hand-labour, and in these there are 4200 looms. Add to these 10 establishments for finishing, calendering, and packing the cloth which is produced, and we may have an idea of the vigour with which the linen trade of Dundee is conducted. We are informed that

600 additional power-loom will be started in a few months.

Some of the spinning-mills are of vast dimensions, and are conducted at an enormous expense. The drain of money for wages, and also for tear and wear of mechanism, are perhaps of less account than the perpetual outlay for new machinery. In the conducting of such works, each proprietor must keep up with the improvements of the day, otherwise he works his mill at a ruinous disadvantage. The introduction, therefore, of every novelty, having for its object the expediting of the manufacture, becomes a necessity in the condition of these capitalists, who are ever dragged on from one stage of improvement to another at a cost of thousands of pounds. Yet what is it but this readiness to embrace new adaptations that has placed British factory-owners in their deservedly high and commanding position?

It seems to be a tendency in manufacturing industry first to divide, and then reunite, branches of labour. We have experienced this in our own limited concern. At first, we had no wish to do more than print, but were at length impelled to adopt all the other branches connected with the preparation of literature. There can be little doubt that textile manufactures will follow this course; spinners will not leave off till they become weavers; and being weavers, they will probably find it expedient to be their own calenderers and packers. It was certainly a great step in the linen manufacture when heckling by machinery was absorbed into the general preparatory process; for in conjunction with the spinning-frame and the power-loom, the whole routine of production, from a bag of flax to a web of cloth, could be effected in one establishment. Some years ago, when in Dundee, we observed that in the large works of Messrs Baxter, Brothers, & Co. a union of departments had been attained. In a series of buildings connected with each other, heckling, spinning, weaving, calendering, and packing, by steam, were successfully combined; the whole of the branches in this single establishment giving employment to 1500 individuals.

In the article already referred to, we stated that as much cotton was now spun by machinery in the United Kingdom, as would require the labour, by hand, of many millions of persons. In the heckling, spinning, and weaving of linen, great results are also achieved by inanimate mechanism. In the spinning-mills of Dundee there are upwards of 170 heckling-machines, each doing as much work as eight men would accomplish by hand-labour—the work done by the whole being therefore equivalent to 1400 men. The 43 spinning-mills contain 98,156 spindles, and fully more yarn is spun by these than can, at a moderate calculation, be effected by 115,000 individuals using the old-fashioned spinning-wheel. With regard to weaving, there are 1420 power-loom in operation, each doing the work of three hand-loom—the whole manufacturing as much cloth as would require 4260 hand-loom weavers. To this number must be added about 2840, for the operations of warping, winding, &c.—making 7100 in all. We should, then, have the following as the probable amount of hand-labour required to perform the work of the Dundee factories:—For heckling, 1400; spinning, 115,000; weaving, 7100—total, 123,500 persons, instead of 11,382, as at present employed. It appears, by a return made to parliament in August last, that there were in England and Wales 135 linen-factories; in Scotland, 189; and in Ireland, 69—total, 393; containing 965,631 spindles and 3670 power-loom; and giving employment in spinning, weaving, and other branches, to 68,434 persons. Taking the calculation for Dundee as our data, it would appear that the work done by these establishments is equal to the hand-labour of 1,156,800 persons. It is believed that nearly two-thirds of all the linen manufactured in the United Kingdom is kept for

home consumption; and as the quantity of all kinds, both yarn and cloth, exported, amounted in 1850 to L.4,845,030, it would appear that the total value of the linen manufacture is fully twelve millions of pounds per annum.

In connection with the manufacture of articles of pure flax and hemp, a large trade has sprung up of late years in the preparation of jute. This remarkable material, the fibre of a species of reed, is peculiar, we believe, to the East Indies, where it grows in great profusion, especially on the vast plains around Calcutta, whence it is shipped in large quantities to this country. During 1850, the export of jute from Calcutta amounted to 22,933 tons. Of this quantity, it is calculated that about 15,000 tons per annum, or two-thirds of the whole, reach Dundee. The labour connected with the cultivation of jute is not great, but the charge for freight being high, its cost is considerable, although not exceeding half the price of average flax. On-reaching the manufacturer, jute is either cut in lengths, and spun in the same way as lint, or it is reduced by a powerful machine to the form of tow, and spun by itself, or in combination with flax-tow. Its fibres are fine and silky, but by no means strong, and where strength is not particularly an object it is well adapted—cloth composed of jute yarn, wholly or in part, having a smooth, glossy finish, and being produced at a cheaper rate than pure linen.

We shall conclude the present paper with a few remarks on a subject which has engaged considerable attention of late—the proposed substitution of flax for cotton. Considering the greatly-increased cost of cotton, the precarious nature of the supply from America, and the difficulty of establishing stations elsewhere, several extensive spinners began to inquire whether it would be practicable to remedy the deficient quantity and increased price of the article, by partially substituting flax—a material more immediately within their reach. Accordingly, experiments were instituted with a view of ascertaining whether means could be adopted whereby flax might be spun by cotton machinery. The result was hailed with acclamation by many, and a Frenchman, an Englishman, and a Scotchman, have been disputing for the merit of priority in what is termed the invention. By being subjected to a process—mechanical or chemical, or partly both—it was found that flax *could* be spun on cotton machinery, and that yarn of nearly average quality was thereby produced. This is all very well so far as it goes; but one or two considerations convince us that the proposed innovation cannot be productive of either present or ultimate benefit. In the first place, the flax must be greatly weakened. In its natural state it consists of fibres fifteen to twenty-five inches long; and were these shortened to one or two inches, as they would require to be, it is manifest that the strength of yarn spun therefrom would be materially diminished. Secondly, there would be no advantage on the score of economy, because flax can scarcely be called cheaper than cotton: by weight it is; but when we bear in mind its greater specific gravity and heavier waste, as well as the cost attending the proposed method of preparation, we should find that ultimately it is not cheaper, but the reverse. Lastly, were the system to become general, as has been aptly observed, 'the demand for flax thence resulting would necessarily advance the already high price of that article, and in the same proportion cotton, being less in demand, would fall; so that at the very outset the substitution would checkmate itself, and consequently cease.' It is our belief, then, that no permanent good can result from these experiments, and we think the evil complained of can only be effectually remedied by taking decisive steps for extending the culture of cotton on a large scale to other lands, and more especially to the British possessions in the East.

Enough has now been said to point out the growing importance of the linen manufacture to this country, and the skill and enterprise which it engages. Comparing the large product of sail-cloth in Dundee alone—an article which finds a market in every maritime region of the globe—with the feeble bounty-supported hand-loom manufacture of last century, we have the most instructive example of what may be done by simply allowing trade to develop its own capacities and find its own reward.

THREE PICTURES.

AFTER OUR OLD INDIAN.

HERE comes our Old Indian again, with a whole basketful (not the waste basket) of offerings, breathing unmistakably of the perfumed East. With poetry in her heart, and music in her ear, this old Indian—we wonder whether she is *very* old!—does not appear to have regarded the land of the sun as a place of temporary exile, but as a home of humanity like our own, where the beautiful things of nature, both moral and material, attain a warmer and richer, if more fantastic, colouring. On the present occasion we have put together, in our own way, 'like orient pearls at random strung,' some of her sketches of Superstitions, which will be entirely new to most of our readers.

VOTIVE LAMPS OF THE GANGES.

It was in the beautiful month of February, one of the lovely spring months in the lower provinces of Hindoostan, that I was pacing up and down a veranda of considerable length, in the hospitable mansion of one of my friends. My object was not merely to inhale the fresh air wafted over the bosom of Gunga, but more specially to enjoy a *private* walk—walking in public being reckoned derogatory to a person in the station of a gentlewoman. I walked and stopped; then walked and stopped again. I could not withdraw myself from that calm and lovely scene; but continued to look and listen, feeling as if some cool sweet breath were stealing over my spirit as well as my senses, and acknowledging in my inner being that, to the thoughtful heart, 'the tongue of nature has a power divine.' It struck six; twilight was past; and we all know how fleeting is the twilight of the East. It soon grew dark; and everything became shadowy and indistinct; and at length faded away in obscurity, all save the fragrant camomly tree in the garden below, with its tufts of white blossoms, and the toilet-flower, with its roots strewn with a profusion of the loveliest flowers,—white petals on an orange tube. These lay like driven snow, and shone forth amid the closing darkness like the good deeds of departed souls.

The stars now began to peer out one by one, and gazing over the balustrade, I saw another bright firmament in the undisturbed waters below. Each luminary glowed there, with a lengthened reflection, giving it the appearance of a comet, while the gentle ripple of the river imparted to it likewise the scintillating flicker of a fixed star. Such nights as these are seen only in the East—where, also, as a set off, the rays of the sun are like scorpions' stings. But presently my meditations were disturbed; some voices seemed to approach from the water side; and in a little while I could see a shadowy object moving along, which turned out to be a passage boat that came to an anchor on the stream. I looked on at the operation, and listened to the muffled sounds that seemed to float up from the vessel.

Three men made their appearance: one descended on the rudder, and seated himself on a bar of wood which appeared to be nailed to it for the purpose; while another remained on the taffrail, and the third disappeared behind the gunwale. A short pause ensued, but anon a light flashed up from the boat, and I

saw a dark arm handing a bright blazing earthen pot, about the size of a dessert plate but greatly deeper, to the man on the taffrail; he again delivered it to him on the rudder, and he in turn committed the lighted pot to the river. While I looked in surprise at this phenomenon gliding down the stream, another followed, and another, and another, till I had counted breathlessly one hundred and twenty! As the current seized them, each in turn twirled gently round, and as if in obedience to some law of attraction, glided close after its predecessor, till they formed in the whole a snakelike line of flame—their rising and sinking with the undulating waters adding to the illusion. As this luminous serpent glided noiselessly away, my elevated position enabled me to follow it with my gaze a considerable distance down the Ganges, till at last it disappeared like the trooping stars above when swallowed up by a cloud.

It may be supposed that my curiosity was strongly roused by this curious spectacle, and being a European, I could take the liberty of demanding its meaning without ceremony. I called to one of the chuprassies to hail the boat, and the reply to my questions was as follows:—'Maharaj, this is done because the brother of Baboo Sirrenauth is gone to Benares to bathe in the river for the recovery of his health—a pilgrimage to that holy place, it is well known, washing away five of the deadly sins. In case the brother should be dead, this offering is for his manes. The baboo himself is at Callie Ghaut sacrificing a goat, and several of us, his servants, are stationed to-night at various places watching, as we set afloat the votive lights, for a sign from Gunga.'

I knew before that solitary lamps were occasionally offered to Gunga, and had frequently watched with great interest the graceful Hindoo female, with veiled countenance and noiseless step, stealing with one to the river side. Before committing it to the waters, she poured out a simple offering of rice and pulse from a brass plate, and murmuring an inaudible prayer, flung upon the liquid bosom of the goddess a wreath of sweet-smelling flowers. Then the little lamp was launched, with its small flickering flame, and in a few minutes the answer of Gunga was vouchsafed to this humble message of love and devotion. If the lamp sunk into the deep—if it was extinguished by the wind—if it voyaged safely down the undulating stream—these were omens by which the devotee ascertained the fate of the beloved, or the fidelity or falsehood of the wandering object of her affections. When this simple votaress is poor, her lamp is fed with a little mustard-oil; but in the case of the magnificent offering I witnessed from the veranda, the pots were filled with cakes of dried cow-dung—the most sacred of substances—and rosin and oil, which together give a bright and lasting light.

THE VOICE IN THE STORM.

No rain had fallen since Christmas. The weather had been cold, and a clear ultramarine sky had renovated the European constitution, and delighted the white man's eye, for several months. Now, however, the 10th of March, the weather was too dry, and every heart longed for the coming rain. The wind began to blow with a mighty breath, and the clouds careered before it like wild horses galloping across the sky. Dry leaves, grass, dust, and stubble swirled round and round, and here and there rose up in columns from the earth, as if to bring down the lagging water. Pedestrians passed on, rubbing their half-shut eyes, and everybody seemed to shrink from crossing the path of the 'devil,' the name given to these pillars of dust.

Soon the clouds were completely packed and piled up into a dense black mass, and now there came a flash of lightning, and a low rumbling sound of distant thunder; then all again was still. The water of the

Ganges, though shrunken and reduced, began to ruffle and blacken, and the boatman, recognising the sign, plied lustily his oars, or worked along the shore with his bamboo poles to reach the ghaut. The ferry-boat, too, with its living load—oh how it strained with might and main to make the opposite shore before the storm broke loose! Pull, brave hearts!—pull for dear life, for the tokens thicken, and man feels what is coming with more senses than philosophy has named! Smaller clouds are now seen sinking lower and lower, like masses of black wool, detached here and there from the mother darkness. The atmosphere is so thick we can scarcely breathe; midges hover in myriads over our faces; the crows and minas chattering, screaming, and scolding, take to the covert of the old bœul tree which overshadows our hammam or bath; and only the white buglah, or ou-ack,* scuds along the black cloud, as if to form a contrast by its snowy plumage.

Now come a few large drops of rain, tap, tap, tapping on the terrace as they fall, with a sound like the ticking of some huge clock, but almost instantly evaporating in the sultry air. Now again the chill wind is rising, and, borne on its wings, the welcome shower at last comes sizzling along, and bringing with it the fresh fragrance of vegetation. There!—there again is another flash! The north-wester is at hand; and now it comes, 'like a cloud-king,' as the natives say, 'sitting on a cloud-elephant, drunken mad, with the lightning for his flag, and the thunder for his kettle-drum.'

It was no time now for out-of-doors observations; and escaping from the first burst of the rush and the roar, I took refuge in our snug parlour, through the ample glass doors and windows of which I could have a full view of the pelting storm. The waterspouts were by this time all running like cascades, and making a deafening noise, for in India they allow the torrent to come down from a height of ten or twelve feet, to rise again from the ground in spray, and foam, and bubbles. The thunder in the meantime kept bursting in louder and louder peals as the storm advanced, till one terrific clap hurried me off to the nursery to see what was going on there. I found the ayah squatted on the durræ, a cotton striped rug, with her paun-box at her side, and enveloped in white muslin and silk petticoat; while my four youngsters sat cross-legged, like little tailors, around her. There was some dispute going on, and the ayah was speaking angrily, but in a subdued voice, to the children, who seemed half-frightened and half-amused.

'How can I hear it, mamma,' cried one, 'when the rain and thunder are making such a noise?'

'Hear what, my dear?'

'The voice in the storm.'

'What voice is it, ayah? Perhaps my ears are better than Mary's.'

'Ma'am,' replied the ayah, 'it is the voice of Lokman Hakeem.'

'Oh, the wise physician, who lived to be so very old?'

'Yes, ma'am; and since you know of him, you are doubtless aware that he is always heard lamenting in a tempest like this.'

My knowledge of Lokman did not extend so far, but the ayah was not loath to enlighten me, which she did to the following effect:—

Lokman, by his knowledge of drugs, had prolonged his life far beyond the allotted span; but he had likewise discovered a powder, by means of which his youth could be restored. As this could only be applied after death, an assistant was necessary, and for this purpose he brought up a youth in every respect as his own son (for Lokman was childless), indoctrinating him in all his knowledge, and confiding to him every

secret of his science—save one. This one—the composition of the powder of immortality, or of perpetual renovation—was to be the final price of his service, to be paid after the apprentice-sage, by applying the drug according to the directions of his master, had restored him to life and youth.

The operation was to be performed in the midst of a tempest from the north-west, and all things were prepared accordingly. A vast caldron was kept perpetually boiling in the laboratory; and a casket containing the precious powder was ready for use. The storm at length came; and when the elemental din was at its highest, Lokman placed this casket in one hand of his apprentice, and an hour-glass in the other.

'Remember what I have told thee,' he said. 'Hurry not, delay not; yet woe unto thee if thou fling not the powder into the caldron to the last grain, before these sands be run!' While yet speaking, he seated himself on the edge of the caldron; and with his eyes fixed, with a deep-searching gaze, on the young man's face, he allowed himself to fall backwards. There was a splash—a suffocated voice—a jet of steam—and the bubbling waters closed over the wisest man of his age.

The apprentice, startled and terror-stricken, stood gazing for some moments at the caldron, almost fancying that he saw the eyes of his master gleaming through the steam. But there was no hurry—the sands of the hour-glass were slow. He was to fling into these waters the powder of immortality; and then—would Lokman keep his word? Why should the philosopher, after he was secure in unfading youth, give away what was more valuable than all the treasures of the universe? That priceless powder was now his; Lokman was no more—why should he disturb an arrangement which seemed to have been brought about by destiny? Mingling with these thoughts, and warring against them, there came grateful recollections, and generous shame, and human pity; but who could tell which should have the mastery? He opened the casket; he held it above the caldron; and he then turned his eyes hesitatingly upon the sand glass. That delay of an instant was decisive: the last grains ran; and at the same moment the subtle powder in the casket, exposed to the heat and steam, evaporated and fled. A wild lament rose from the caldron, and out-shrieked the tempest, piercing the traitor's ear, and maddening his brain; till, with a frantic cry, half of remorse, half of rage, he sprang into the hissing waters.

But the sacrifice did not console the spirit of Lokman, for his lament has been heard ever since in the Indian storm; and that night, as the north-wester swept in unappeased passion over the house, I felt that it would take no great stretch of fancy to syllable amid its roar an articulate cry.

SINGULAR MOCK MARRIAGE.

It was a short time after daybreak, and the whole neighbourhood were either performing their usual ablutions at the ghaut, or returning from doing so. The women, who are the water-carriers for the household, took the opportunity of filling their ghurras; and many a trim figure might be seen mounting with bare feet the steps from the river, balancing one of the vessels on her head, and carrying another on her hip, while a neatly-shaped arm clasped the latter round the neck. One of the females was on this occasion in a greater hurry than usual, and her gossip, who wanted to speak to her, could not keep up with her.

'Oh, Conmol,' cried Secta, 'what in the world is the hurry? I see you are like myself, just after your purification and poojah: let us go quietly home and have a talk together, for I have something to say to you.' Conmol slackened her steps a little, and the two

* A small heron.

women, at length turning into a gullee or close, entered a hut. This was Connol's habitation; and placing her water-pots on the little platform in the corner, she covered them with a cocoa-nut shell. She then took off her wet sárrie, replacing it with a dry one, and spreading the former on the thatch of the house.

'Now, Seeta,' said she, 'I am ready for you; what is it you want?'

'I want a dog,' replied Seeta; 'and as you know Sewah Sing Havildar's wife very well, will you ask her for her Elatchie (cardamum, a favourite name for pet-dogs)? He is a pretty black and tan terrier, with four eyes.'

'The havildar's wife's Elatchie! Have you not months enough to eat your dahl and rice, that you want a dog? and will no dog please you but the havildar's (the feminine for havildar)?'

'How silly you are, sister!' said Seeta. 'What I want is the *lean* of the black dog for a little while. I have had eight children, though only three are alive now, and I cannot keep a dog, that is sure enough. My last, Couranie, has, you know, been always a puny child, a seven months' babe; so at her birth her father would have the Brahmin to cast her nativity, and although her horoscope cost us five rupees, it contained nothing favourable. I was told to call my babe Couranie (Cinderella), a name of humiliation, as I had lost several before her; but her *real* name is Rottoon, and it was chosen by the Brahmin, by placing two lighted lamps upon two different names, and as the lamp blazed up at once upon Rottoon, it became her real name, and Couranie only her by-name. Well, the holy man told us also to beware both of the eighth month and eighth year. Now, sister, I was just feeling her gums this morning, and there I found a tooth!'

'A tooth at the eighth month!—nothing is more unlucky! Now I see why you want the black dog with four eyes: we are to have a make-believe marriage, to propitiate the evil stars. Well, then, come along; the havildar will lend Elatchie very willingly, especially when she hears he is to come in for a share of the jellabies and luddoes. But oh, Connol! is not your child's fate written on her forehead? Was not the Bedattah-Pooroo (a form of Brahma) with her?'

'I remember nothing about that visit.'

'And I shall never forget it. But, come; I can tell you my adventure on our way to the havildar's:—I was scarcely thirteen, when my Kirstno-mohun was born, and I had heard so much of spirits and daynah's in my village, that I was afraid of my own shadow. So, on the sixth day after my confinement, the day on which the Spirit Bedattah-Pooroo visits the young infant, my master went out, but my poor mother lingered till it was dark. Then she pressed me to her breast, and told me that Bedattah-Pooroo would come before the end of that day to write my child's fate on its forehead. She gave me a thousand directions about keeping the house quiet; and so the lamp was shaded, and pen and ink placed on a stool before my bed, and I was left all alone with my first-born. I clasped him firmly to my bosom, and fell into a disturbed feverish sleep, when the dreaded spirit was, you may well conceive, the subject of my dreams. At last I thought the bed shook, and I awoke in terror. "Oh! spare my boy, good lord," cried I. "Oh! be merciful!" and I grasped—the cat, which had leapt up, as it was morning! But, see, we are now at the havildar's.'

Their mission was successful; and Elatchie, an overfed little blackamoor cur (for this colour is essential), with two yellow spots over his eyes, was yielded to their request to perform his part in the ceremony. Seeta then, while returning homeward, bought, for a few pice, several pretty sweet-scented wreaths of champas, bailahs, and jasmynes, and some bouquets; and two pounds of various sweetmeats, which cost her no more than three annas. She now invited to the marriage a

few of the neighbouring gossips, and all betook themselves to her hut.

Couranie was asleep, and awoke feverish and out of humour; but she was speedily washed, and dressed in a nice little suit, and the brief and simple rites of a Hindoo marriage went on. The wreaths were divided between the dog and the babe. Some kheer, rice and milk, which had been cooked for the purpose, was taken out of the pot, and Elatchie and Couranie were fed by the same hand, and with the same shell spoon; and they partook of the sweetmeats in the same manner. Their wreaths were now exchanged—the closing and significant part of the ceremony; and thus was completed a marriage, which was to last for seven years. At the end of this period, if Couranie lived, the union would be dissolved with a similar ceremony, and a marriage contracted with a human bridegroom of her own caste.

This singular marriage is by no means performed as a joke; but, on the contrary, is connected with strong religious feelings. So likewise is the naming of children, who are frequently called after a god or goddess. The dog, if chosen for the bridegroom on nuptial occasions, is not a sacred animal with the Hindoos, although they seem favourably disposed towards the species. Dogs abound in their villages, where, without being the property of any individual, they receive a small portion of every one's food, left for them upon a plantain leaf outside the door or at the corner of the house. The Pariah is, notwithstanding, generally speaking, a ghost-like, famished being, but hunger and misery teach him intelligence.

The Mohammedan population, on the contrary, especially those who are devout, hate dogs with a religious hatred, which is founded on the following legend:—Adam they say was made of clay, and the image laid out in the sunshine to dry, previous to having the spirit breathed into it by the Most High. In that state the angel Gabriel usually kept watch over the inanimate dust; but he discovered that, when despatched on another holy mission, the evil one, Eblis, had taken advantage of his absence, and to signify his hatred, spat upon the future lord of creation. From this unholy saliva Gabriel formed a dog, to stop the dark fiend in his mischief; and thus is the dog to this day an unclean creature, and wherever his hair is shed no guardian angel keeps watch.

RAMBLES IN SEARCH OF WILD FLOWERS.

MANY, very many years had elapsed since I had been free to ramble unshackled over hill and dale—years during which my time had been occupied, and my health shaken, by attendance on the sick-beds of those dearest to me; and when an interval of entire freedom from such duties occurred, I gladly hailed the opportunity it offered me of carrying a long-cherished scheme into execution—no less than that of thoroughly exploring the neighbourhood in which I had for some time resided, with a view to discover its botanical and floral treasures, and to collect specimens for my herbal. I hoped that my health might be benefited by the pleasant sort of *far niente* life I proposed, so I resolved not to regard the clamour of 'the world's large tongue,' but to roam freely at will over cliff and heath, salt marsh and bog, and to bring home as many basketfuls and handfuls of flowers and roots, and mosses and fungi, as I chose—hoping that the enjoyment thus derived, and the benefit to mind and body which was likely to arise from such excursions, would amply compensate to me for any mortification I might experience from seeing the eyes of the gay sea-side visitors engaged in scanning my shabby dress, or the soiled shoes with which I frequently returned home, and wondering what I could be going to do with such huge bunches of flowers as I usually bore away from the scenes of my triumph.

Botanical research was certainly one of my main objects, but by no means the only one I had in view; for a love of form and colour—a delight in flowers for their own sakes, for their perfume, their beauty, and their poetical associations—matters wholly irrespective of science, led to a craving desire to possess them, to collect not merely specimens to dry, but clusters of fresh blossoms which I might group in my vases, and with which I might decorate my rooms. I have always delighted in viewing nature in all her different aspects, and this year especially I longed to ramble where

'Along the crisped shades and bowers,
Revels the spruce and jocund spring;'

and great indeed was the enjoyment with which I carried out my design; and often since, when precluded by illness from similar pleasures during weeks and months of solitude and suffering, great has been the joy with which my mind has recurred to the remembrance of those varied and cheerful scenes, and unfeignedly have been the refreshment and delight so received.

And now, if my readers will allow themselves to be put *en rapport* with me, we will travel together through some of the sweet sylvan tracts through which I rambled. It was a day of unrivalled beauty, that sweet, sunny, April day on which I started from my home. The scene of my exploits was the neighbourhood of the pretty little village of Budleigh-Salterton, situated on the south coast of Devon, at about three miles to the east of Exmouth—a locality which I would strongly recommend to the botanist as most prolific, comprising as it does a greater variety of soil, and presenting more varied habitats for plants than any other part of the coast with which I am acquainted. Within a mile and a half of the village may be found bogs, salt and fresh-water marshes, cliffs, rocks, woods, fields, and lanes, together with high and low pasture-lands and heaths, intersected by a multitude of clear brooks and streamlets, whose banks are always fertile places for the collector. There are, besides, little thickets lying on the face of the lofty cliffs, and sloping to the sea, which produce a great variety of plants; so that it may altogether be considered as an excellent botanising district. The broad and open sea danced gaily under the influence of a light breeze, and its waves glittered in the sunbeams, which, as the day advanced, warmed the atmosphere almost to summer heat, when, taking some luncheon with me, I proceeded up the village street, along by the rustling little brook which runs through it, and after turning aside for a minute to seek for and find the pretty little upright peasewort (*Mönchia erecta*), which grows in a by-lane just off the road, I pursued my course up the hill to the open heath, gathering as I passed specimens of the gray-cup moss and white curled Lapland moss, which there cover the ground, and inhaling the rich fragrance of the golden-blossomed gorse (*Ulex Europæus*), that gorgeous flower, before which the great naturalist Linnaeus knelt in wonder and in worship—not of the flower, but of Him who had provided such a splendid ornament to deck the commons and the hills for man's delight!

It is always pleasant to have a definite object before one—a reason for turning one way instead of another—a something to attain; it is good and pleasant in the greater concerns of life, and so it is in flower-gathering. My object, then, on this occasion was to find the fertile spike of the wood horse-tail (*Equisetum sylvaticum*) in its perfection. I knew where to seek it, for in the preceding summer I had been the happy discoverer of a whole forest of the graceful sterile spikes, so like little fir-trees of some ten or twelve inches in height; and I now set forward with great glee to seek it in fruit. So descending the hill, I pass on between steep banks crowned with shining holly and ivy, from amongst the roots of which spring many fair spring-flowers, mixed with ferns, whose young fronds, at this season of the

year, present a most singular appearance, being curled up so as almost to deceive one into the idea that the hedge is covered with brown hairy caterpillars. The appearance of some of the large shield-ferns in the spring is indeed most curious, and, on examination, most beautiful; the closely-compact cinctate form into which the young leaflets are compressed, and the strong, vigorous upright of the rachis, or stalk, which supports them all, densely covered with shining light-brown chaff, is very striking; and when, after a few days, the apex, or point, droops, and they assume the exact form of a shepherd's crook, it becomes even more remarkable, until by degrees the leaflets expand, and the common observer recognises the fern-leaf fully developed, and in its usual state.

But what is that which slips from under my hand as I stoop to gather one of them? There it glides up the hedge, its glittering, many-coloured skin and zig-zag motion leaving no doubt that it is a common snake, roused from basking in the sunshine, and much more afraid of me than I of it. It is a common notion that these snakes bite; but it is not so: they have no power to injure, and may be handled with impunity—the viper, frequently called the adder, being the only kind of English snake which has venomous properties. The sight of this reptile reminds me of an occasion when, stooping to gather a flower on the edge of a cliff, my fingers rested on one of that less harmless kind, whose dark skin, and the yellow crescent-like mark on its head, marked that it was indeed a viper. It darted rapidly down the precipice, leaving me, by the preserving mercy of God, unharmed. I had, however, once the honour of holding one in my hand, the *pet* of a medical friend; but although he had succeeded in extracting its fangs, he had not in eradicating a most detestable fetid odour which exhaled from its skin, and rendered it so offensive, that I was glad speedily to resign the honour of being its nurse.—But to return to my walk.

The hedge and bank on either side, and the trees above, are all 'instinct with life,' and full of bright living creatures—bees, and many-coloured flies, and butterflies without end; and there is one of the large giant dragon-flies darting arrow-like through the air, probably in pursuit of some poor little insect destined to become its prey; and from time to time I see a little newt (*Anguis fragilis*), commonly called the blind-worm (though not in reality blind), pursuing its sport among the tufted roots below; whilst the jabbering of the young chaffinches and hedge-sparrows above, and the more tuneful notes of the thrush and the lark, and of the multitude of other choristers which salute the day, remind me that it is not man alone who has the sense of enjoyment, or for man alone that the great Creator cares, but that He 'all his works with mercy does embrace.' But on—on for the *equisetum* over that broken stile, with the old hollow tree to the right, and down the sloping meadow, I hasten; yet though now near the object of my search, I must linger a little to examine that bit of bog, so rich in botanical treasures, and so bright with flowers; and here I find clusters of the pretty bog violet (*Viola palustris*) lining the hedge, and nestling on every bit of sunny hillock and rising bank, selecting just such situations in the bog as the sweet violet (*Viola odorata*) would appropriate to itself in dryer pastures: and the growth and general character of the two plants are similar; but the petals of the bog species are shorter and rounder, the leaves more kidney-shaped, and the whole plant of a more succulent and transparent appearance than any other species of violet. It is pretty and delicate; the lilac variety is of a paler hue than the purple of the sweet violet, and slightly atriated with a deeper tint; and the white variety is of a most lustrous purity: but the sweet perfume which is found in their congener, the *viola odorata*, is wholly deficient in both, and with it

the pleasant and poetical associations which throng around the latter. I find here also the pretty pale butterwort (*Pinguicula Lusitanica*), its tiny-spurred blossom, of a pale lilac hue, raised on a slight flower-stalk, high above the miry earth whence it springs; and its cluster of root-leaves looking much as if they had been anointed with some unguent, so greasy do they appear. Sheets of cotton-grass (*Eriophorum angustifolium*)—‘the wool-bearer,’ as its name signifies—extend over the whole surface of the ground, their dense tufts of fibrous white cotton-like material dancing in the light breeze which wafts over them, and presenting a singular and beautiful appearance; whilst below the spikes of the yellow asphodel (*Narthecium ossifragum*) are beginning to spring in every direction from the beds of white bog-moss (*Sphagnum squarrosum*) which mat the ground. These beds of moss are varied in tints from white to a most delicate green, and everywhere inlaid with the brilliant scarlet of the leaves of the round-leaved sundew (*Drosera rotundifolia*), and the deeper red of the long-leaved variety (*Drosera longifolia*), which, though not yet in bloom, exhibit, as they, at all times do, that distinctive beauty from which they get their name. On every hair of the multitudes which stud the surface of the whole plant, hangs a drop of dew, which glitters like a diamond in the beams of the sun—and this carpet of moss and sundew will be in a little time more brilliantly beautiful than it is even now; for then the clear rose-pink of the bog pimpernel, now scarcely visible, with its delicate pinnate leaves of the tenderest green, will be spreading in every direction between and under the moss, and intersecting it everywhere. In June, the marsh arrow-grass (*Triglochin palustre*) may be found here, as may the sea arrow-grass (*T. maritimum*) in the salt marsh on the other side of the village.

The neighbourhood of this spot is in itself attractive, independent of its botanical stores, and possesses a charm in the exquisite untrodden freshness of all around, and the air of extreme seclusion which prevails: here

‘The birds their quire apply—airs, vernal airs
Breathing the smell of field and grove, attune
The trembling leaves?’

and a spirit of rustic tranquillity prevails, which, together with the mosaic under-foot, where flowers

‘Brodered the ground, more coloured than with stone
Of costliest emblem,’

would ravish and delight the surprised inhabitant of a city who should suddenly be transported to it, revealing to his astonished gaze a scene far different from those which meet his eye in the Exchange or crowded mart where the business of life usually finds him. It is a sweet spot. To the right lies a rising ground, richly wooded, through which rushes a noisy little brook, widening at its foot into a limpid stream, sweeping the meadow below. To the left lies the hamlet of Upper Knowle, with its pleasant farms and home-steads; and before you, beyond the strip of bog, is a sweet fair meadow, absolutely enamelled with flowers,

‘Which, not nice cut
In beds and curious shoots, but Nature boon
Poured forth profuse,’

and the clear-flowing brook before named coursing along the lower part, beneath oaks and beeches of lofty growth and exceeding beauty. It is a lovely scene, and my very heart gladdens as I think of its beauty; but alas! it is treacherous ground, for the meadow being composed of bog and marsh, presents most unstable footing; and often, as I pass from one gay group of flowers to another, I feel the cold, cold water gush over the foot which has too confidently rested on some safe-looking mound, teaching me another line of that lesson, that

the most lovely is not always the most trustworthy! Such milk-wort (*Polygala vulgaris*) as grows here I never before saw—sapphire, pearl, amethyst, pink, topaz, all might find their match in colour; here and there are intermixed with polentilla and tormentilla, primroses, orchises, and hyacinths, of such varied hues, and in such wealth and glory of blossoming, as I never before saw assembled on any one spot. On through the sweet scene I wend my way, selecting from its stores till my hands and my tin-case fill so fast, that I am glad to fix on a spot which lies high and dry under the shade of a spreading tree, and there to deposit my load to await my return, and then to proceed over the rugged stile to the right in search of the equisetum: but alas! alas! here, too, is delusive footing; for the moment I touch the ground, away go both feet sliding on the slippery mud; and, after two or three staggering efforts to save myself, in I go, both feet into such a bed of mire, as reaches well nigh to my ankles! But what do I mind that? There, close before me, stand armies of my expected treasures; and I have only to stagger out as I staggered in, and possess myself of the brilliant green spikes which spring up on all sides amidst the marshy ground.

The order equisetaceæ is allied to the filices or ferns; but it is in many respects quite dissimilar: it is very peculiar in its structure; and from the circumstance of the fertile stalk appearing at a different season from the sterile, and the former being in most species of a less striking appearance than the latter, it is so little generally known or noticed, that a slight sketch of its history and characteristics may not be out of place. There are many English species of this genus; the largest of them, the great water horsetail (*Equisetum fluviale*), may probably, in its sterile spike, have attracted the notice of many who have been much in the country. It abounds in moist places, growing to the height of from two to four feet, and throwing out from an upright rigid stem from ten to twelve whorls of bristle-like leaves, which spring from the articulations of the joints of the stem. These joints, which occur at regular intervals, are clothed with a sharply-toothed sheath, which is edged with intense black, the rest of the stem and sheath being of a tender green, and the leaves (or branches, as they are called) of a deeper hue. The whole plant is something like a bottle-brush, and very singular and noble-looking. This species forms a fair type of the whole tribe. The fertile stems in all the species appear, and in general perish, before the sterile rise above the ground; and the difference between them is very marked. The fertile stem is succulent and brittle; it springs very rapidly, and perfectly upright, from the earth; is leafless, and in general of a pale salmon or brownish hue, some of the species being more or less tinged with a soft green. It is striated and pointed like the barren stem, and the articulations clothed in the same manner with a sheath, the colouring and denticulation of which varies with the species. The summit of the stem is crowned with a dense spike or catkin, composed of many angular, stalked scales, which bear at the back from four to seven oblong cells, each containing many minute seeds, the height of the fertile spike being from four to ten inches, and that of the sterile from eight inches to four feet, according to the species. The cuticle of all the equisetaceæ contains a siliceous earth for polishing wood and metals, of which a large quantity is imported from Holland.

The order takes its name from *equus*, a horse, and *seta*, a bristle. Humboldt speaks of a species of tree common in Australia and Tasmania (the *casuarina*), the branches of which resemble the equisetum; but in England it is a genus standing alone, and without congeners, the ferns being the nearest of its allies. Should any of my readers, who have noticed the large brushlike spike which I have described, go in April to the spot where

in the preceding summer he has found it, he will be greatly surprised at the odd, naked, flesh-coloured things which he will see starting from the bare earth, without a leaf, and about the thickness of his finger at the top, and from four to six inches in height, which is all that he will find where he used to gather the noble stem, of which he will see nothing more than mere rudimentary beginnings. If the soil is not very wet, he will possibly find a smaller species (*Equisetum arvense*), the field horse-tail, domesticated with it. In July, the bog horse-tail (*E. palustre*) may be seen in most boggy ground, differing, however, from most other species in having both barren and fertile stems branched; so that the former are in all respects like the latter, except that the apex of the fertile is formed by a small dark-brown catkin, of which the sterile is devoid. The fertile spike of my elegant little favourite, *E. sylvestricum*, is also slightly branched; for as the catkin matures, a fringe arching over like a canopy, of a most vivid green, is thrown out from the joint next below it; and the rest of the plant being of a delicate semi-transparent flesh colour, tinged with a clear apple green, whilst the effect of the whole is increased by the contrast afforded by the dark-brown which edges the sheath, the plant forms altogether at this season a most lovely object, and one highly calculated to adorn a drawing-room table, and worthy of being placed in a lady's most elegant vase.

How many of God's wonderful works are unknown to and unappreciated by man because they are not 'sought out' by him! How rich are the regions of earth, and air, and sea, in varied wonders, all reflecting glory and honour on 'the great Workmaster,' and calculated to give delight to his creatures, but how comparatively few are there who really 'take pleasure therein!' I have often felt sorry to see how little effort is made to lead the minds of the young to an interest in such pursuits as tend to a knowledge and love of nature and natural objects. Much time is spent in learning music; whilst the rich harmony which God has obtained for man—the harmony of water, and birds, and insects, the deep music to be heard floating through the branches of the lofty trees, and breathing like the tones of harps amid the herbs and lowly bushes—is unheard, or fall unheeded on the untutored ear! The languages of foreign lands are painfully acquired, whilst the pure living language, full of poetry and instruction, which is uttered by the fields and groves, the flowers, and the dews which moisten them, is to many a dead and unknown tongue! Again, how many will travel half over the world, and spend life and fortune in studying amid the galleries of art, whilst nature (of which art can be at best but the shadow), with its depth of colouring and its perfect unity and keeping, is uncared for and unnoticed! There is nothing which opens the eyes to the beauties of nature so much as a love of the God of nature. The Christian feels with the Italian poet Filicaja—

'Thus if we see a hill, or vale, or mount,
Or shining river, or translucent fount,
On God the eye is fixed, although it seem
To rest but on that vale, or fount, or stream!
And the full sun utters in praise of Him
The ardent, eloquent language of its rays;
And the deep torrent, foaming to the brim,
And the wind's sighings, all are to His praise.
Each tree loves Him, and that harmonious bird,
Whose deep poetic warblings oft are heard,
Passing from branch to branch in praise away,
"I love thee, God—I love thee!" seems to say.'

I was now at leisure, having secured my prize, to examine the little enclosure in which I stood, and mark game for a future day, and also to gather a handful of the creamy primroses and sweet blue hyacinths which grew profusely around me; to watch the little fairy dragon-flies with their tiny bodies, some

azure-blue, some scarlet, which seemed to hang suspended on the air as if by some magic power, their wings being so exquisitely airy and fragile in their fabric as to be, when in motion, quite invisible; and the little thread-like bodies, sustained by their rapid vibrations, appear as if they were without wings. I now found in embryo that which a few weeks after I sought and found in fruit, the beautiful flowering ferns (*Osmunda regalis*); but as this paper has already stretched beyond the limits I had intended, I shall leave the description of that till a future time, when I hope to conduct my friends to another point, and shew them what the bogs are like in July.

A FACTORY FARM-STEADING.

An interesting account was lately given in the 'Times' newspaper of certain improvements which have been effected in a farm establishment at a place called Patrington, in the East Riding of Yorkshire; and we notice the subject in order to make more widely known what may be done to render the practice of agriculture conformable to an exact and economic, and, it may be added, profitable, manufacture:—'At Patrington the influence of capital and the energy of the manufacturers have converted the quiet of a retired rural town into a scene of bustling industry. Some three years ago, about 1000 acres of land here were purchased by Mr W. Marshall of Leeds. He instantly began the work of improvement, and nearly the whole estate has already been tile-drained under the superintendence of Mr Parkes. About eighteen months ago the foundation of a new and extensive suite of farm-buildings was laid. The whole is now completed, and occupied by stock, while the barn is flanked by a goodly row of large wheat-stacks, the produce of the farm. Straight lines of well-made roads lead to the different fields, and give easy access for getting home the crops and taking out the manure. A steam-engine of eight horse-power occupies the centre of the barn, within whose capacious roof are fitted (by Crosskill of Beverley), in different compartments, every imaginable machine for converting the corn and vegetable produce of the farm into food for the sustenance of man and beast. The thrashing-machine thrashes and dresses the corn, and then delivers it in the granary, where it is either stored or passed to the grinding-loft, whence it descends to the lower storey, after being ground and dressed, and is there received in sacks, and packed aside as flour ready for the baker. From the end of the thrashing-machine the straw is carried by an endless web to another loft, where it is passed through the chaff-cutter, and reappears below as chaff. Other machines, conveniently arranged, break beans and oats for the horses, oilcake for the cattle, and linseed for mixing with the cut chaff. The root-house is situated at one end of the under storey, opening by large doors to the farm road, through which the roots are stored. Elevators, moved by the steam-engine, lift these rapidly up to a turnip-cutter, placed at such a height that the cut turnips fall into a truck, whence they are conveyed on a railway throughout the whole of the feeding-houses. A different compartment contains the cooking apparatus, where, by steam from the boiler, cooked food of various kinds is prepared for the pigs and other farm stock. Underground is a great arched tank, into which all the rain water that falls on the buildings is conveyed by spouts and pipes. From this the engine feeds itself with water, and likewise pumps up water to a tank on the highest part of the barn, whence it supplies by pipes all the different divisions of the farm buildings; and, in case of fire, could be readily turned to good account. To another tank, in rather too close contiguity to this, the engine pumps the liquid manure of the farm, which can then, by applying a gutta-percha hose, be dispersed over the manure heap. The cattle-houses are situated in parallel lines, at right angles to the barn. Each animal has its comfortable box, 12 feet by 10, with a supply of fresh water in one corner, and a manger for its food in the other. Between

every double row of cattle a railway is placed, on which the trucks with their food are easily pushed along. A covered manure-pit receives the dung, when it is carried from the cattle, and protects it from the influence of rain and weather. The mode of cultivation to be hereafter adopted on the farm we did not learn, as, in the absence of the manager, there was no one to communicate such information; but as the same spirit and energy will no doubt be manifested in the field, it will soon be necessary to pack the animals more closely together in the cattle-houses, as the green crops of a farm of this extent, if principally consumed at home, will suffice for three times the number of animals for which accommodation is now provided. By converting the boxes into stalls, the room at present occupied by one will suffice for three; and, as all other arrangements may remain unchanged, the charge for interest will then fall lighter on each. At the entrance to the farm, Mr Arthur Marshall of Leeds has erected extensive works for the rotting and scutching of flax. In these he at present manufactures the crop of 300 acres, but the works are sufficient for 500. The farmers of Holderness, however, do not seem to go very readily into flax culture, and Mr Marshall is therefore obliged to hire the land, sow the seed, provide people to weed and pull the crop, and the farmer then carts it to the works, where it is stacked till required. For the use of the land Mr Marshall pays £8 an acre, the farmer undergoing no risk of failure of crop, and no outlay for seed or labour. The average yield of dressed flax per acre is five hundredweight, at present worth 70s. a hundredweight, besides two quarters of seed, worth 50s. a quarter. The employment given in these works, and in the extensive improvements at the farm, has raised the rate of wages for men, women, and children, in the parish of Patrington, from twelve to fifteen per cent. above that of the surrounding district.

THE OLD COUPLE'S NEW YEAR.

'A GLAD NEW YEAR to thee, my love, I am alive to say,
Though, husband, forty years ago this was our wedding-day;
And hope and purpose gave our lives, that day whereon
we look
As the illumined title-page of a most pleasant book.

'Oh, who could know the girlish bride or stately bride-
groom now,
With the travel-soil of forty years upon each withered
brow!
But to our eyes are beautiful grey hairs or wrinkles
either—
Time's notches wherewithal to mark how long we've been
together.

'So long! my finger shrinketh from the ring that sealed
the vow—
Maybe the heart hath sent it word it needs no symbol
now:
But the long swelling sum of years is pleasant in our
sight,
For they are but the witnesses to Love's exceeding might.

'Love taught our hearts the music first to which our days
went by,
And though to graver measure set, keeps up the melody.
From our fireside we backward look, and feel our hearts
the while
Still quiver to a merry thought—we're not too old to
smile.

'With Memory's moonlight streaming through the vista
of the past,
We see what pastures green were ours, what gardens on
the waste;
That time of struggling, too, when with his clouds of rose
and gold,
Love softened down, and warmly tinged what was itself
so cold.

'God gave our lifetime, like the year (still equal in His
ways),
Spring for its winter, dawn for night, and Sabbaths for
work-days:
Nay, *every* day its blessing had; and as we've older grown,
Love hath wellnigh filled up the years with epochs of its
own.

'For glad birthdays, and bridal-morns, the brightening
seasons strew,
And burial-days—Love's calendar hath its eclipses too,
Two baby-girls went back to God; and one fair son beside,
Who the tall heights of manhood reached, looked out on
life, and died.

'Their lot that seemed so gloomy once, seen through a
mist of tears,
As we come nearer in a clear and lovely light appears;
And to revive old joys again, our children's children rise:
How dear that sound of tiny feet, that flash of joyful
eyes!

'And even on the grave's low edge shall Love's sweet
flowers abide,
And with their richly-perfumed breath, its earthy savour
hide.
God turns another leaf of life; His hand thereon is placed,
And but a single line at once He suffers to be traced.

'Oh which is marked as *first* to fall! But when the call
is given,
Love's silver cord will stretch to earth, and draw the *last*
to heaven.
Our length of labour was the same, and so should be our
rest:
He will not keep us long apart who knows our natures
best.

'We turn on the receding years a calm and cheerful eye,
And looking forward—God be praised!—our hope is full
and high;
But *this* day comes as some old friend whose face we've
glad to see;
And so, dear love, with all my heart, "A Happy New
Year" to thee!' E. A. G.

CUNNING OYSTERS.

By a treaty made between England and France in 1838, it was agreed that the ocean within the coasts of both countries should be considered as belonging to both, with the exception of the coasts between Jersey and France, where a line had been drawn, beyond which, on either side, the fishermen of the respective nations were not to encroach. A multitude of cunning oysters, taking advantage of the neutral ground, have made their bed exactly upon the line; and as they are of excellent quality, the temptation is too strong for the fishermen on both sides. They are continually encroaching on each other's ground. The consequence has been that several French fishermen have been taken and fined by the English, and several English by the French.

TRANSFORMATION OF A NAME.

In Mr Crowe's work on Central America, a curious instance is given of the transformation of a name. 'Belize' derives its name from a Scotch buccaneer who first used the harbour as a hiding-place nearly a century ago; and, strange as it may appear, the word Belize is a corruption of Wallace, the name of this freebooter, which by English writers was written Wallis, and by the Spanish Vallis, and then Balis, which was finally modified by the English to Belize, pronounced Belleeze.

WHERE IS THE GERMAN FATHERLAND?

THE national song was never more gaily and hopefully sung than by a party of young lads, who, in the year 1813, sallied forth from the small Hanoverian town of Wunstorf, and took the road to Hamburg. They were all furnished with the knapsack and staff of the wandering handicraftsmen of Germany, and were respectably attired in frock-coat and cap, with a well-filled tobacco-pouch dangling from their necks, and a pipe of formidable dimensions in their hands. Some friends accompanied them a little way out of the town, but these dropped off one by one, and at length the travellers found themselves alone, with the world before them. It was then the song burst forth from their young hearts; although at first the voices of some may have been unsteady, and the eyes dim with tears which looked along the vista of the future. '*Vas ist des Deutschen Vaterland?* Is it Prussia, or Saxony, or the Rhineland, or the Belt, or Bavaria, or Styria, or Austria, or the Tyrol?' and at each question came the reply, with a wild swell—

* Nein, nein, nein, nein,
Seyn Vaterland muss weiter seyn!

No, no, no, no, wider—wider is the Fatherland: till at length the conclusion was delivered in a solemn and impassioned sweep—'Wherever the German tongue is spoken, wherever it sings hymns to God in heaven, that, noble German, is thy Fatherland!' The young men, therefore, in leaving Hanover, were not leaving their home; for everywhere their native tongue made music in their ears, and brought with it assurance of a country.

One of the travellers was a lad of sixteen, called John Henry Louis Haneman; and his fortunes being of a very peculiar, though not, in the ordinary acceptation of the term, romantic character, to him we will confine our attention. Of the rest, some, after an absence of three years, prescribed by the custom of their trade, returned to Hanover to commence business on their own account at home: others yielded to the attractions they met with beyond the frontiers, and found there an abiding place and a continuing city: but the decision of Haneman was not left to his own inclination.

His business in the world was to make bread—not figuratively but literally: he was by trade a baker; and in the great city of Hamburg he expected to find ample scope for his industry. A residence of ten years was requisite to enable him to obtain the right of settlement; but this was of little moment to a lad of sixteen, and he cheerfully served one master, and then another, as apprentice, till he completed thirteen years, and had attained the ripe age of twenty-nine. During

this space, however, he did not neglect his duties, or forfeit his rights, as a Hanoverian subject. He returned to his own country at the proper times, to fulfil the term of military service imperative upon all Germans; and found himself, as we have said, in his twenty-ninth year, and in a fair position to begin the world on his own account.

Haneman had his dreams and his ambitions: he would be not only a baker, but a commission-merchant. Haneman, moreover, was in love: he would have a wife to sit in his parlour, or serve in his shop; and then he would go on baking his bread, selling his goods, and seeing his children rise about his knees, and he would wax in fortune, and flourish even like a young bay-tree.

It was in the year 1832 when all this was to begin; and his first step was to obtain permission from the town where he had passed his youth in learning how to bake, to employ his acquirements in its service. Neither in the free city of Hamburg, nor in any other free city, may a man presume to buy or sell for his own and the public good without going through certain preliminaries which cost money. Haneman contemplated paying the usual fine or fee; but it was also necessary that he should obtain a legitimization-certificate from his native state. This required additional outlay, and, what he grudged more, time; and he therefore, most unluckily, listened to the suggestion of a friend, who thought that there would be no great harm in his using the corresponding papers of a deceased brother. For the sake of expedition, rather than from any other cause, he presented these as his own papers, and thus entered upon the rights of citizenship in Hamburg.

The cheat was soon discovered, and Haneman called to an account. He was guilty, there could be no doubt; but the trespass was considered venial in a young man who had resided in the city since his boyhood, and whose character was well known. The police authorities, therefore, let him gently down, and an admonition was probably all the chastisement his imprudence received on this occasion. But the police is a practical body which looks at persons and things as they are, while the senate deals more in abstractions. The senate was scandalised at the escape of Haneman; and in order to vindicate the sanctity of its justice, it had the offender arrested, deprived of his rights of citizen, and hunted out of Hamburg. This was a terrible reverse of fortune to the ambitious baker. It occurred in autumn, and as he went forth, a banished man, the fields were alive with the peasantry bringing in, with songs and joyous cries, the harvest in which he had hoped his own oven was to share.

He proceeded, however, to Hamelin, where he

obtained his military discharge, the certificate of his birth, and authority to travel as a journeyman. He was now in possession of his own papers, and the senate of Hamburg would doubtless be satisfied. It was a terrible lesson he had been taught: but it was over. His plans were not damaged by what had occurred, for he was well known in the city, and his fraud, as the law termed it, was not more heinous than if he had carried furtively a bottle of brandy in his pocket through the barrier. He reached Hamburg, therefore, in good spirits: but he had reckoned without his host. He was no sooner recognised on the street than he was arrested, and sent back as a prisoner to Hanover.

Haneman was confounded; but his fatherland was not Hamburg, for the German tongue followed him in his exile. Exile? A man can hardly be said to be exiled to his own native state; and turning round he shook his clenched hand at the Free City, and said with Coriolanus—'I banish you!' His industry, his talents, his acquired knowledge, he would transfer to Hanover, and perhaps might himself flourish but little the less for the change. He forgot, however, that he now made his reappearance among his countrymen in the character of an outcast rejected by another state: Hanover refused him a settlement; she would grant no right of citizenship to one who had applied for the same right elsewhere; and Haneman, hardly knowing whither to betake himself, repaired to Altona.

Here, with a sinking heart, he produced his own papers; and he could hardly credit his good fortune when he found himself accepted. He began a commission business; but unluckily it had some connection with his neighbours of Hamburg, which obliged him to visit that city. In November 1833 he was recognised on the street, arrested, and fined. On the 26th of March following, he was again arrested, fined, and sent back to Altona; the publicity of the transportation bringing to the knowledge of the authorities his fatal delinquency, upon which he received a severe reproof from the president of the town-council, not for the fraud, but for the concealment.

After this Hamburg so far relaxed as to permit his business-visits during the daytime, although he was not allowed to remain within her precincts at night; and now Haneman, enjoying a breathing space till 1839, embarked in a respectable business in the wine-commission trade, visited his constituents at Oporto, and began to hold up his head in the world.

And then came back his dreams of domestic dignity, and he determined to choose a wife. He did so prudently. His lady-love was not a penniless damsel, but the rosy-cheeked hostess of a Hamburg tavern; and on his return from Oporto the betrothal took place, which we may explain is a religious and legal ceremony, making a very near approach to downright matrimony. Sanctioned by the customary feelings of his country, Haneman went to live in the house of his bride, to whom for two months he proved a useful assistant. Unfortunately, a merry-making carried beyond the bounds of temperance led to a quarrel between the pair. The lady deserted her house, leaving it to Haneman, who had no other idea than to conduct the business till his beloved should return. Here, however, he was destined to put himself again in suspicious circumstances. Change being required for a valuable coin presented by a customer, Haneman could only obtain what was wanted by breaking open the box containing the money of the concern. This, we presume, betrothal did not exactly entitle him to do. On the complaint of the guardians of his betrothed, he was taken up and examined by the police, who handed him over to the authorities of Altona, with a friendly suggestion to the president that it would be well to deprive the imprudent wine-agent of his rights of citizenship. The president responded courteously to this hint, and not only adopted it to the letter, but had the liberality to

pronounce upon him, in addition, a sentence of banishment from Altona.

Whither was he now to go? Where was he to seek his fatherland? He knew but of one place, and that was the nearest. It is true, for a period of eight years (from 1832 to 1840) every visit he had paid to Hamburg was followed by some disaster; but there only was he known, there only had he friends, comrades, acquaintances. Perhaps his fair hostess had repented of her anger—perhaps her guardians alone had been severe. Haneman clung to the social sympathies. He was like a bird turned loose from a balloon into the desert air, and which prefers returning to its prison to encountering the unknown terrors of that shoreless gulph. He went straight to Hamburg, though with faltering steps and a trembling heart—whose prophecies were fulfilled the moment he entered the city. He was arrested on the 8th April, and sentenced to eight days' imprisonment, with hard labour.

This was bad enough; but when the punishment was over, and he was turned out of prison, the authorities were so good as to deign no farther notice of him. He remained, therefore, in Hamburg till July in the following year, when he was again arrested and condemned, for his audacious contumacy, to six weeks' imprisonment, relieved, week about, with the varieties of idleness and the treadmill. After this he was handed back, in September, to Altona; but the president there, though willing, as we have seen, to shew any reasonable courtesy to the neighbouring state, did not understand such liberties, and returned him at once like a shuttlecock. The senate of Hamburg was at a loss what to do. They shut him up in prison as a matter of course, and then opened a correspondence with Hova, his birthplace, and with Wunstorf in Hanover, the place of his apprenticeship and confirmation, to find out if possible what claims he had upon them. He had no claims. All had been forfeited by his citizenship elsewhere; and in the beginning of 1842 he was once more escorted across the frontier, and set down in the district of Altona. But Altona was determined. She sent him back again immediately; and Hamburg put him into her house of correction for eight days, with the treadmill every second day, and then chased him out of her bounds into the world at large.

By this time Haneman was getting wearied and dogged. He did not go far. Why should he? What was one place to him more than another? Fatherland! Where was his fatherland? If it was not Hamburg, or Hanover, or Altona, how could it be territories he had never seen, and where he did not know a human being? 'Wherever the German language was heard,' the song answered, 'and wherever it sung hymns to God in heaven!' That was a lie; for he heard it every day, and everywhere he went, both in hymns and curses. Was this his fatherland where he now wandered? It could not be, for surely his fatherland would not give him a stone when he cried for bread; and here, after a little while, he was without money, or food, or shelter. He returned to Hamburg.

In Hamburg he lay in jail till the 10th of March, and was then conveyed across the Hanoverian frontier. At Stade the outcast was laid hold of and lodged in prison till the authorities should be able to make inquiry respecting him, by opening a correspondence with Hamburg; and the result was that, by the end of the month, there arrived an order from the Hanoverian minister directing that Haneman should be sent to Altona. So said, so done: but being found there on the 26th of April by his old friend, the president, he was punished with twenty-five blows of the stick for having been transported by Hanover. From Altona he was sent escorted into the Hamburg bounds, where he was instantly arrested. This time the senate determined to transport him beyond seas for his repeated contumacy in returning from banishment!

When Haneman was lying in jail, pondering on his extraordinary fortunes, and endeavouring, perhaps, to recall to his conscience what horrible crime it was which had made him an outcast among men, a light broke suddenly through the bars of his prison, which made even his overwearied heart leap in his bosom. It was accompanied by cries, shouts, screams, the hoarse roar of multitudinous voices, and the noise of many thousand feet rushing along the streets. Then the prison was opened, and the inmates turned forth to face as they might. Fire was before and around them—nothing but fire. Hamburg was blazing like a funeral-pile, and its inhabitants flying in all directions. Here was excitement for Haneman. Why should he fly? What had he to lose in the flames? There was work forward. Work! He had not worked for—he knew not how long. He was ravenous for work; and so he carried water, and toiled at the engines, till he lay down and slept from exhaustion. The fire awoke him earlier than the sun had ever done in his life, and he began anew to work—work—work, day after day, night after night, snatching food when and how he was able, and sinking into a deathlike sleep when nature could stand no more. It was only work he cared for. It was so glorious a feeling to be and to do something. The energies that had so long been pent up within him blazed forth, roaring and craving like the conflagration, and only sank into repose at last when, after many days, the flames of Hamburg expired in the ruins they had made.

By the 2d of May the authorities had time to bethink themselves of Haneman; and although the police—practical as usual—interfered in his favour, he was sent to his old lodgings in the house of correction, and turned out thence on the 2d of June, to be set loose on the eastern frontiers of the kingdom of Hanover. In Hanover they would not have him, and he skulked back into Hamburg, where he lay unnoticed till the 29th of September, when illness compelled him to have recourse to the publicity of the hospital. Here he remained till the 18th of March 1843, when he was dismissed; and in two days after he was laid hold of as usual by the police, and conveyed to the eastern frontiers of Hanover. From Winen he was instantaneously sent back to Hamburg, where he was once more captured, and detained in prison till the 1st July 1844. He was then set at liberty, on his promise to quit the city within eight days. This promise he broke, for he was now reckless; and on the 14th August he was sentenced to fourteen days' confinement on bread and water, and then chased out of the bounds.

This extraordinary war waged by three sovereign states against a solitary individual might have proceeded unnoticed, till the victim of tradition and the bureau had sunk under the overwhelming force opposed to him; and Haneman, the hero of a wilder romance than ever fiction dreamed, might have passed away like a shadow, to mingle with the other shadows of the past. But fate ruled it otherwise; and the case we are recording is destined to stand out in bold relief amid the refinements and the rationalism of the age. The attention of an eminent lawyer of Hamburg was accidentally drawn to the subject, probably by the frequent appearance of Haneman in the courts, and he advised him to contend no longer with the individual states, but to petition the Diet to allot to him some abiding place in the wide German land. Haneman caught eagerly at an idea which assumed that he had any fatherland at all, and at once demanded a passport for Frankfort. This was at first refused, but ultimately conceded on the guarantee of the lawyer; and the homeless German, provided with a petition drawn up by his benefactor, set forth upon his important journey.

Among the crowds besieging the office-doors of Frankfort, there was recently seen a pale, sickly, travel-stained, worn-out, old-looking man, distinguished from the rest by the aspect of isolation he presented. There

appeared to be nothing in common between him and the other petitioners—no analogies to compare in each other's story, no hopes or fears to deduce from each other's experience. Silent, watchful, constant in attendance, unwearied in waiting, this gaunt figure, with its staring eyes, haunted the bureaucracy like a spectre.

'Who are you?' said an official one day, half-disgusted and half curious.

'I am Haneman.'

'Oh! well, and what do you want?'

'I want a home.'

'We have no home here for you.'

'I want a country.'

'Bah!'

'I want to know where my Fatherland is. I am a German, and must have some portion in the German land. If I did wrong a score of years ago, and have not been punished enough, punish me still; but let there be some end of it. I want to know where I belong to—where I have a right to go, and a right to stay. It is only a place to live in I want—a place to work, and to die in; and I don't care what part of this vast country it is in, so that our German tongue still sounds in my ear, and I can hear it singing hymns to God in heaven!' The official sent him to another, and that other to a third; and so it went on till Haneman, hopeless, penniless, and destitute, crawled back to Hamburg. Here he was as usual arrested and thrown into prison. The advocate again interfered, drew up a fresh memorial, obtained his 'liberty,' with a travelling passport, and sent him once more to petition the Diet in person.

Whether he died by the way, whether he is still on his journey, whether he is now being bandied from office to office in Frankfort, whether the Diet decided that, as a German subject, he was entitled to breathe the air on some spot of German land—we do not know. We know, however, that in one sense Haneman is not dead. His case has been fully and widely published, and is no doubt working its due effect among those innovatory influences which have so thoroughly unsettled the German governments and administrative systems. We shall probably hear more of Haneman and his singular persecutions 'after many days.'

The facts of the narrative we have given, are taken from Haneman's own petition, published in the 74th number of the Kieler newspaper of 1845, and reproduced in a work published at Leipzig last year, the 'Polizei Geschichten' of Ernst Dronke.

Supposing these facts to be true—and we see no reason to doubt that they are so—they afford a curious instance of the proneness of men to suffer themselves to be governed by theories and traditions. The act visited by this inveterate persecution, though harmless in itself, was illegal, and involved the loss of the rights of Hamburg citizenship and banishment from the town. The laws of Hanover denied similar rights even to her own sons who had sought them elsewhere, and they likewise refused harbour to transports from other states. Altona had the power to strip of her citizenship an individual who had obtained it by the very natural concealment adopted by Haneman, and to banish from her precincts a foreigner placed in such circumstances. Thus all the three governments acted according to law; and thus, in the midst of this legality, was the 'noble German' of the national song converted into an outcast from his fatherland, and hunted, lashed, and caged like a wild beast, for a great part of a score of years!

In the English law of settlement may be found, although on a very small and partial scale, a parallel to this gigantic German abuse. A pauper—perhaps a widow with two or three children at her heels—seeks refuge in the workhouse at Worcester; but the guardians, considering from her account of her history that the expense of supporting her should fall upon London, send her to the metropolis. There they imagine that

Bristol is better entitled to the burthen, and they transmit the claimant thither; but at Bristol they wholly deny the charge, and pass the wanderers back again to Worcester. All this involves grievous expense to the public, and still more grievous hardship to the forlorn family; but speedily the affair is ended by the submission of one or other of the recusant parties, while throughout the whole contest the paupers have been in possession of the support they claimed.

In a case like this the law, if necessary, would step promptly in to settle the dispute: and here the faint parallel ends; for the Diet, which is the international umpire of the Germans, turned, as we have seen, a deaf ear to the petition of the outcast Haneman.

L. R.

LONDON MUSEUMS OF THE SEVENTEENTH CENTURY.

WE find, by a scarce tract, that in 1664 there was a museum publicly exhibited in London. The title of the tract is as follows:—‘A Catalogue of many Natural Rarities, with great Industry, Cost, and Thirty Years’ Travel in Foreign Countries, Collected by Robert Hubert *alias* Forges, Gent. and Sworn Servant to His Majesty. And daily to be seen at the place called the Musick-House, at the Miter, near the West End of St Paul’s Church. London: 1664.’ It appears by the catalogue that this museum among other rarities contained:—‘A mummy: a giant’s thigh-bone, more than four feet in length, found in Syria: a haget, that sleeps for six months; it is a creature of the island Mayonto in the lake Yondarro: the horns of a dog of a land near China: the ribb of a Triton or Mereman, taken by Captain Finney on the shoutts of Brazil, 500 leagues from the Maine: the vein of the tongue of that whale, that was taken up at Greenwich a little before Cromwell’s death: a manucodiata or bird of Paradise with feet, for it hath great feet, to shew that it perches on trees in a land as yet unknown, for they are never seen alive, but are always found dead in the Malaccos Islands, by reason of a continual wind that bloweth six months one way and six months the other way, and because of their sharp head, little body, and a great feathered taylor, they are blown up so high that they fall dead in another climate or country: a pelican’s head, bill, and bag, to prove that it is a water-fowle; he does not make himself to bleed a purpose for his young ones, but by accident, by carrying of shell-fishes in his thin bag makes it to bleed: a great crocodile, given by noble Squire Courtene, a lover of vertue and ingenuity.’

The author of this catalogue, it may be observed, draws particular attention to the fact of the bird of Paradise having feet. Perhaps it is not now generally known, that from the native manner of preparing skins of these birds, to sell as curiosities, requiring the feet to be taken off, it was long considered by Europeans that they were footless. This error, however, did not originate with Pigafetta, who first introduced the bird to European notice, after returning from his voyage with Magalhaens to Seville in 1522. He distinctly speaks of it as having slender legs a hand’s-breadth in length; though, strange to say, he describes it as having no wings, but that it is blown about at the mercy of the winds. Margrave, John de Lael, Clusius, Wormius, and Bontius, all described it with feet; yet Aldrovandus Scaliger and Jonston were of a contrary opinion. Even the great Linnæus seemed to sanction

the absurd idea when he appropriated the term *Apoda* (footless) to one of the species: and last of all Buffon, the beauty of whose diction as a writer does not compensate for his inaccuracies as a naturalist, describes them as birds, ‘qui ne marchent ni nagent, et ne peuvent prendre de mouvement qu’en volant!’ We need not further refer to the nonsense respecting this bird in the catalogue, than merely to state that all the mystery and doubt which formerly enveloped the history of the creature are now cleared away.

Hubert, *alias* Forges, by way of impressing on the public the superior value of his collection, gives a list ‘of the rarities that are shewn in the University Garden at Leyden in Holland,’ which contains a dragon, a mermaid’s skin, and a griffin’s foot! Indeed, every page of his catalogue bears the impression of the puffing showman, without any pretensions to classification or science: at the last, speaking of more of his rarities, he says that he ‘omits their names to avoid prolixity. But if the owner of this collection of curiosities does sell them to any noble-minded party, he then, God willing, will write at large a more ample declaration, to the expression of each thing in particular, to honour that virtuous person that shall buy them!’

The Royal Society was incorporated by Charles II. in 1662, and in 1665 Daniel Colwall, Esq. gave up his private collection to that learned body: many other curiosities were soon added by different members. This museum was kept in that afterwards shamefully-misappropriated building, Gresham College. In 1681 Dr Nathaniel Grew, one of the secretaries, published a catalogue of the entire collection, dedicated to Mr Colwall, the founder, at whose expense the plates were engraved. This work is entitled ‘*Museum Regalis Societatis*’ or a Catalogue and Description of the Natural and Artificial Rarities belonging to the Royal Society, and preserved at Gresham College. Made by Nehemiah Grew, M.D., and Fellow of the Colledge of Physitians, London. 1681.’ Among many errors, we yet find in this volume a great increase of scientific knowledge. Grew, in his preface, states that he will commence his classification with man; for he says, ‘I like not the reason which Aldrovandus gives for his beginning the history of quadrupeds with the horse, *Quod præcipuum nobis utilitatem præbat*; being better placed, according to their degrees of approximation to human shape, and one to another: and so other things according to their nature. Much less should I choose with Gesner, to go by the alphabet. The very scale of the creatures is a matter of high speculation!’

Here we find a direct step to our present system of classification; yet still the learned doctor believed in the existence of the unicorn; for a little farther on, he tells us that ‘the greatest rarity, if once experienced to be of good use, will soon become common. The Jesuites Barque, of which no man hath well yet described the tree, and very few know precisely where it grows; yet what great quantity doth the much use of it bring over to us? Unicorns’ horns, on the like notice of trade, would be as plentiful as elephants’ teeth.’

The catalogue begins with an Egyptian mummy, and the worthy doctor displays his knowledge of his own more particular profession by giving the names of three different medical preparations, which were concocted out of a mummy. He, however, thinks that the virtues of these medicines consist more in the drugs used in the process of embalment than in the body itself, and is of opinion that medicines compounded of fresh drugs would be more efficacious. We have next ‘the entire skin of a Moor tanned. The skeleton of a man,’ with the names of four medicines extracted from human bones. ‘A skull,’ which, it appears, afforded seven medical preparations. Another skull ‘covered all over with moss called, by the Paracelsians *usnea*.’ Though Dr Grew does not say anything in favour of this moss

as a medicine, yet wonderful powers were attributed to it by the followers of Paracelsus. Van Helmont relates the following sample of its 'astral and magnetical virtues,' which he states came under his own observation:—'A certain soldier of a noble extraction wore a little lock of the moss of a man's skull, finely enclosed betwixt the skin and hair of his head; who, in friendship interceding betwixt two brothers, that were fighting a mortal duel, unfortunately received so violent a blow with a sword on his head, that he fell immediately to the earth. With which blow his hat and hair were cut through as with an incision-knife, even to the skin; but he escaped without the smallest wound or penetration of the skin. I need not anticipate—yourselves may without much difficulty guess—to what cause the guard of the skin may be justly ascribed.'

After the 'humane rarities,' we next find the viviparous quadrupeds classified by the forms of their feet—as multipedous, bipedous, and solidipedous. Here we meet with an old acquaintance, we presume—the leg-lone of an elephant: it was brought out of Syria as the leg-lone of a giant. Speaking of the elephant, Grew makes some very just, though quaint remarks upon that animal—in fact he anticipates our present classification of the pachydermatous animals; he says that 'the elephant, in my mind, hath some affinity with the bear: both are taper-tailed, hunchbacked, little eyed, armed with tusks, have the nether chap sharp before, and a movable snout—the elephant's proboscis being but a long snout, and the bear's snout a short proboscis.'

The medical virtues of the rhinoceros, we find, are numberless, all parts of the body being of a curative nature; still the doctor was not aware of the existence of the two-horned species, for he says, 'But what Martial means, speaking of the rhinoceros—

'Nanque, gravem gemino cornu sic extulit ursum'—

I do not well understand. The figure given by Piso represents but one horn only. Neither does Bontius describe or mention more than one horn; and those who do speak of another, yet make it a very small one; and not over against the other, but on the fore-part of the back.'

The above line from Martial has given rise to many futile disquisitions and attempted corrections by, and among, those who were ignorant of the existence of the two-horned rhinoceros. Two specimens of this species were shown at Rome during the reign of the Emperor Domitian, on some of whose medals their figure was impressed; others were exhibited in the times of Antoninus, Heliogabulus, and Gordian III. Martial lived in the reign of Domitian, and in all probability the rhinoceros 'gemino cornu' was actually seen by him. There are four species of the two-horned rhinoceros known to the naturalists of the present day.

Amongst the horns we find, 'a very great horn of the black buck, or of the ibexmas (ibex, *Capra Ibez*); in shape almost like a bended cross-bow. By the string, three-quarters of a yard long; but by the bow, about an eln. It was formerly tipped with silver, and kept in a gentleman's house, and shewed to some especial friends for the claw of a griffin. See the figure thereof in Moscardus's Museum.' Moscardo's print of the griffin, in his work 'Note Overo Memorie Del Museo de Lodovico Moscardo, Nobile Veronese, Padova, 1656,' certainly shews to us a very ugly, but not a very ferocious-looking monster: it is not such a creature as we would suppose the griffin to be, which Bulwer so pleasingly tells us of in 'The Pilgrims of the Rhine.' In short, it reminds us of a large skate that had just been pulled out of the water, flapping on the seashore.

After the viviparous, Grew introduces us to the viviparous quadrupeds—'A great chequered tortoise-

shell from Madagascar, nowhere described or figured,' is evidently, by the plate, the *Testudo geometrica* of Linnaeus: 'a scaly tortoise-shell, nowhere described or figured,' we find, in the same manner, to be the *Testudo imbricata*. Of the sea-turtle he says: 'The flesh maketh a pleasant jelly. The belly part baked is an excellent dish. The legs applied to the part afflicted are a most experienced remedy in the gout.' Hear this, oh gourmands and bon-vivants! when you see the turtle in the pastry-cook's shop, you may then exclaim that your 'bane and antidote are both before you!' With all our author's acuteness, we find him placing 'a great bat or flutter mouse' among the birds; naively remarking, that 'the bat stands in the rear of beasts, and in the front of birds.' We are, however, gratified when, speaking of the humming-bird, he says:—'Piso relates as a thing known to himself, and many curious and credible men with him in Brasile, that there are there a sort both of caterpillars and of butterflies, which are transformed into this bird; and that in the time of transformation there is plainly to be seen half a caterpillar, or half a butterfly, and half a bird, both together. Yet the same author saith that this bird buildeth her nest of cotton wool, and layeth eggs. That a caterpillar should produce a bird, and a butterfly too the like, and yet this bird lay eggs to produce its own kind, are three greater wonders than anything that has been said of the Barnacle.' By the last word he alludes to the popular idea, that the Bernicle goose (*Anser bernicla*) was produced from the bernicle, a well-known crustaceous animal. Though Belon in 1551 ridiculed this preposterous notion, yet all the other naturalists, down to 1678, held to the ancient belief. The publication, however, of Ray's 'Wellighby,' in that year, exploded and refuted the unsound doctrine. Grew, though now treating the idea with contempt, believed in it himself only three years previous to the publication of this catalogue. For, as secretary of the Royal Society, he published, in the 'Philosophical Transactions,' a letter from Sir A. Moray, minutely describing the marvellous transformation, as it was said to have been observed in one of the islands of the Scottish Highlands. When speaking of the 'Barnacle,' Grew alludes to this, saying: 'And with respect to so worthy a person, who never meant to deceive, I myself was once induced to publish his description of the same.' This curious letter is in the 'Philosophical Transactions,' 137, 1677-8. The fishes are divided into oviparous and viviparous. In the latter class we find a 'Triton, or mareman, called in Brazil's Yupiapa.' From the viper we find eleven different medicines can be obtained; and when we come to the shells we find four pharmaceutical preparations are afforded by pearls. The list of shells is large, and so is that of vegetable productions. Of the 'Fossils and Petrifications,' he says: 'It hath been much disputed, and is not yet resolved, of many subterranean bodies, which have the semblance of animals, or parts of them, whether they were ever such or not.' The stones are divided into gems, which are distinguished by their colours; regular stones by their shape; and irregular stones by their hardness. 'Metals, mineral principals, salts, sulphurs,' &c. follow. This concludes the list of natural objects, and consequently we have now 'artificial matters; of things relating to chemistry; instruments relating to natural philosophy.' In the last class we find two air-pumps; and in the next, which is 'things relating to mechanics and mathematics,' there is 'a reflecting-telescope, contrived by Mr Isaac Newton.' Mechanical curiosities follow; and also 'the picture of a basilisk, pretended by those who shew it to be a real animal so called. But it is an artificial thing, made chiefly of the skin of the raja and the legs of a dodo or some great fowl.' The catalogue is concluded by a list of the coins and antiquities. It appears that money was received for exhibiting this museum. The 'Lon-

don Spy' (Ned Ward, 1709) states, that when he visited it he had to cross the attendant's hand with silver.

We are afraid of tiring the patience of the reader. Suffice it to say that the labours of Ray and others, the classification of Linneus, and the great extension of maritime discovery and commerce, cleared away the clouds of marvels which beset the path of natural history, until it arrived at the high position it now holds in the great temple of the sciences. It may be interesting, however, to learn that the son of a person named in these articles collected the *nucleus*, which has since increased to the grand proportions of our national British Museum. William Courten, as Tradescant spells the name—the noble Squire Courtine of Hubert—the Courten of more modern times was, as we have before mentioned, one of the most extensive English merchants of his day. He married Katharine, the tenth daughter of the first Earl of Bridgewater. His father, Sir William Courten, also a merchant, incurred severe losses from the seizure of his forts, factories, and property, at the time of the cruel massacre of the English settlers in Amboyna by the Dutch. Some years afterwards, William Courten sent out an expedition, consisting of two ships, the *Bonne Esperance* and *Henry Bonaventure*, to attempt the retrieval of those former disasters. Both of these ships were also captured by the Dutch: the loss—said to be about two hundred thousand pounds—completely effected the ruin of this once wealthy family. The Earl of Bridgewater, who had been a collateral security for his son-in-law, refused to fulfil his obligations, swearing that 'he would not fry (we wont say where) for his own debts, for which he had set apart some lands, but that he would pay none of William Courten's, in whose estate he had been deceived.' These engagements, however, caused considerable trouble and embarrassment to the Bridgewater family for several years afterwards. Courten—being also badly treated by a partner, and overwhelmed by debts which he could not pay—to escape the importunities of his creditors, fled to the continent, where he died at Florence in 1655. His only son, William Courten, the last of the male line of the family, was born in 1642. Sir Hans Sloane speaking of him, says, that 'from his earliest years he did not regard the pomp or vanities of the world, but gave himself up to the contemplation of the works of God, whose infinite power, wisdom, and providence he saw and admired in the creation and preservation of all things.' The young Courten was educated and protected by his noble and wealthy relatives, until he was summoned into Chancery, sued, and arrested by the creditors of his father and grandfather. He pleaded that he was neither heir, executor, nor administrator to his father; that whatever had been given to him was from goodwill, and not by right; that to avoid all evils, he would leave his native country without demanding anything as heir to his father or grandfather. He was accordingly permitted to do so. The exile of William Courten was not a fruitless one: he travelled over the greater part of Europe, studying the languages, manners, and customs of the various countries he visited, and collecting whatever he could obtain that was rare in nature or in art. He remained abroad for about twenty-five years, and then returned to England with a museum, which he shewed 'very freely and with great civility, to the advancement of the glory of God, the honour and renown of the country, and the no small promotion of knowledge.' This good and scientific man died in 1702, leaving his museum to Dr—afterwards Sir Hans—Sloane, on the condition of the payment of some legacies. Previous to this augmentation, the collection of Dr Sloane was comparatively insignificant. This collection Sir Hans Sloane, by his will—in which he speaks in the highest terms of Mr Courten—desired that it should be offered to the nation after his death, which took place in 1753.

Parliament, by the act of 26th George II., accepted that offer. Long after this collection had become national property, and until the great importations of curiosities from the South Seas and Herculaneum, the 'rarities' collected by William Courten formed the greater part of the contents of the British Museum.

THE VALUE OF RUBBISH.

THE valuable discoveries in chemistry which have been made of late years, and their extensive application to the useful arts, have originated a variety of trades more or less curious in their character, but exceedingly important in their social effect. The active industry of many thousands of the population is at this moment employed in a manner unheard of fifty years ago; and it is gratifying to think that this employment is afforded, to a large extent, by the converting of commodities long regarded as worthless into articles of great commercial value and importance. The trades thus originating, though of a unique and singular character, are not popularly known, if known at all, beyond the narrow limits of their immediate connection. That of 'Dirt-washing,' for instance, has so imperceptibly crept into existence, that many of our readers will be startled to find us treating it as a noticeable branch of the national industry. Such, however, it is; and our description of this oddly-named business will serve to illustrate in a remarkable manner the scrutinising research which distinguishes the industrial spirit of the country, since its staple commodity, or raw material, if we may so name it, is nothing more nor less than *rubbish*.

The term rubbish we apply in the same degree and sense as it might properly have been so applied to rags before they became convertible into paper; or to bones before they were discovered to be a highly useful manure; or, still more appropriately, to that heterogeneous accumulation of animal matter from which is now produced the valuable article known in commerce as the prussiate of potash.* As for the name of the trade, which is Dirt-washing, it is not, we admit, particularly well adapted for ears polite; but it is the name by which it is popularly known wherever it is known at all, although some of its more fastidious professors will insist upon terming it smelting or metal-refining. This, however, is not so expressive a name as the other. It carries us away from the basis of the trade, and transports our imagination to the Titanic processes of Swansea. At the same time, when one looks at the rapid progress making every day in useful applications of this nature, it is not difficult to imagine that the word *rubbish*, as commonly applied to things without value or of no account, will eventually become inapplicable and obsolete.

The chief commodities of our trade may be classified in connection with four distinct branches of manufacture: namely—1st, brassfounding; 2d, the manufacture of lead and plumbing; 3d, typefounding; and 4th, shipbuilding. This division, however, does not comprehend some of the minor departments of the trade; but as those we have indicated form its staple, they are sufficient for our present purpose.

Brassfounders have at least half-a-dozen different products that may properly come under the operation of the rubbish-smelter, but the most important of these

* See for numerous curious instances of the kind the article 'Nothing is Useless,' in No. 132.

are their furnace ashes; that is to say, the ashes from the coke or other fuel consumed in the furnace whereby the crucibles are heated which contain the metal for casting. This seems at first view a most unlikely article of commerce; so much so indeed, that when the smelters first appeared on the ground with the view of purchasing such refuse, they were regarded by the trade as either lunatics or disguised thieves. That such was the general impression among brassfounders may easily be ascertained by inquiry of any tradesman of ten years' standing. The following account of one of these visits we give as we received it from a tradesman of respectability:—"I was called on one morning," said he, "some ten or twelve years ago, by an odd-looking person, who described himself in a most unorthodox dialect as a smelter, and who began to open a negotiation with reference to purchasing my 'brass-ashes,' as he styled them. I did not exactly comprehend him until he explained this to be the cinders from my furnace ash-pits. I replied that it was my custom to cart them away as rubbish, when he stared at me with such a look of upbraiding wonder as I shall not readily forget. He would give no explanation of their use to him, farther than that he intended to build a furnace and smelt them. Thinking the fellow crazed, I told him he might have them for the taking away, and I promise you he did not let the offer slip. He must have had a rich harvest in this case, for he got my ashes gratis for a period of six months. Latterly he paid me five shillings a cart-load. But at length competition appeared in the trade, which within the last two or three years has been excessive. The result is, that I am at this moment receiving at the rate of 15s. per ton, or upwards of £20 per annum, paid in advance, with every prospect of a further increase, for a lot of rubbish which ever since I can recollect were carted away at my own expense."

We inquired of the same individual if he knew what was really done with his furnace-ashes; but although entertaining a vague notion that they were useful in some kind of relation with copper-smelting in Wales, he candidly owned that he knew nothing about the matter; and he remains to this moment in profound astonishment 'that any one could afford to pay 15s. or 20s. per ton for rubbish.' This mystery, which is the secret of the smelting trade, we shall endeavour to explain, and the rather that we desire to correct the prevailing misapprehension in the trade that the amount of money so received is for an article of little value.

The ordinary mode of brassfounding or casting brass in this country is to melt in a crucible first the required quantity of copper, then to add the necessary proportion of zinc. Copper, according to Professor Daniel, melts at a heat of 2000 degrees Fahrenheit, which is as nearly as possible a white heat; while zinc requires for the same result only about 750 degrees, or a very low red heat. In fact, the ordinary mode of melting zinc by itself is in an iron pot, in precisely the same manner as lead; while the melting of copper can only be effected in a crucible, and with the aid of a very hot furnace. Zinc is in a high degree volatilisable with heat, and it is obvious that the conjoined product of copper and zinc (brass) must partake to a considerable extent of this peculiarity. In other words, the admixture of a metal fusible at a red heat with another metal then in a state of white heat, must expose the whole mass to a strong oxidising action; and as an invariable consequence, a proportion of the alloy thus formed—determined by the time of exposure and the degree of heat—is driven out of the crucible.

This is the principal cause of the waste which foundries sustain in melting brass, and for which an allowance is usually made in the foundries. Another cause is the absorption of the metal, owing to the intense heat, and its own penetrating nature, into the

pores of the pot. In both cases the lost brass descends eventually into the furnace, where, uniting with portions of vitrified coke, it produces what are technically termed 'clinkers;' but for the most part it becomes incorporated with the fuel, and hence the ashes in the form of small globules of black indistinguishable oxide.

In this metal, then, or rather in this metallic oxide contained in the brassfounder's ashes, resides the true secret of their intrinsic value. But the smelters themselves are ignorant of the fact. All of those we have conversed with on the subject attribute the wealth they find to broken crucibles, carelessness in charring, or other accidental occurrences; but although these things unquestionably contribute to render the ashes richer in metal, they are comparatively rare in well-regulated casting-shops, and under no circumstances could they bring about the same unvarying result. The brassfounders suppose, that by the ordinary methods they adopt, they are able to recover the metal so lost; and an extensive house in Birmingham informed us, that after having carefully separated the metal from their ashes, they had still not the slightest difficulty in disposing of their refuse to smelters at high prices! This involves a mistake; for no such separation can be complete otherwise than by means of the intricate and laborious operations of washing and grinding subsequently described, and these, too, applied to large quantities.

It may occasion some surprise, but it is nevertheless the fact, that the ashes thus sold under the name of refuse often contain nearly as great a percentage of metal as most of the copper ores smelted in this country. Their average produce, however, we take to be about one-half of that of copper ore; and this will be more apparent from the following assay we have made on the curious subject before us:—

Three specimens of Edinburgh brassfounders' ashes, carefully selected at various times, and from different quantities, yielded on a quantitative analysis respectively, $5\frac{1}{2}$, $4\frac{1}{2}$, and $2\frac{1}{2}$ per cent. of pure metal; thus indicating an available average produce of about 4 per cent., which, however, is to be understood as being still subject to reduction on the large scale by the furnace. The average produce, or the amount of pure copper obtained from the copper ores smelted in Wales, is computed by Brande to be $8\frac{1}{2}$ per cent.

The furnace-ashes thus produced are purchased by smelters at prices varying from 10s. to 20s. per ton, carted to their works, and subjected to the process of washing and smelting, which we shall briefly describe. The quantity necessary to form, in smelting parlance, 'a melting' (from thirty to fifty tons, according to circumstances) having been obtained, the operation may commence. Two or three large tubs, calculated to contain about eighty gallons each, are filled with water, and the ashes are washed from the one to the other of these, through the medium of four or five sieves of different degrees of fineness, beginning with the largest, and rejecting, as the operation proceeds, the refuse from the different washings. Technically, the order of the process is termed, 'roughing,' 'tozing,' 'looting,' and 'jigging,' of which specimens of professional nomenclature we shall gladly spare ourselves a literal translation. The effect, however, on the whole, is very decided: the fine metal contained in the ashes is produced perfectly clean, and entirely separated from the coarser materials of the heap; and the larger particles contained in the 'clinkers,' before referred to, are obtained by a further process, preliminary to the washing, of stamping, crushing, or more generally grinding under the iron rollers of a clay-mill.

The washing is an exceedingly laborious and tedious affair; but so far as we know, has only in one case been effected by the aid of machinery. A rather extensive refiner in the neighbourhood of Spitalfields employs a small steam-engine, with an ingenious adap-

tation of its power to this purpose. In place of tube there are sunk pits filled with water, and in each of these a large sieve worked by a crank. In this way we have been assured that a quantity of fifty or sixty tons can be cleaned in a single week.

The whole amount of this washed metal is now mixed with about one-half its bulk of clean brass-founders' dust (that is, if a good quality of metal is desired), and is then ready for the operation of smelting or reducing in the furnace. This process is very simple, but beyond comparison the finest in the trade. A reverberatory or air-furnace, of the peculiar construction employed in smelting ores, about 12 feet long by 3½ or 4 feet broad, with a chimney about 50 feet high, is charged with fuel, and lighted; the top of this furnace forms a regular arch, and its bottom or sole, usually constructed of fine river-sand, has a gradual inclination towards the lower part of the furnace (or well, as it is termed), which literally consists of a hollow basin formed in the sand as a receptacle for the fluid metal. At equal distances along the side of the furnace there are three apertures about a foot square, furnished with movable doors: by the first, the fire is charged with fuel; by the second, the oxide is thrown in, after being mixed with the bisulphate of potash or other analogous salt, as a flux which assists in a material degree in the reduction; and by the last, the product, or pure metal, after being melted and completely run down in the well, is first 'slagged,' or cleaned on its surface, and finally poured out into ingots, when it is now ready for the market. In this state it forms the article of commerce tolerably well known in the country as 'ingot brass'; and its value runs from L.45 to L.50 per ton, according to quality. The smelting usually lasts the greater part of a week; the furnace roaring night and day the whole time.

The quantity of ashes annually disposed of in this way is now very large; but we can of course only offer an approximation to the amount. Edinburgh and its neighbourhood produce about sixty tons a month, or from 700 to 800 tons a year. Taking Scotland at four times that quantity, we have about 3000 tons per annum. London we calculate to produce nearly double that amount, but from some cause or other the trade there seems to have fallen into disrepute; and, generally speaking, the large foundries prefer washing and smelting their own ashes; and in this way we have been told that one or two of the largest of them can keep two smelters constantly at work for their own refuse.

The grand seat of the trade, however, is at this moment in Birmingham, where, we have good authority for stating, two-thirds of the whole brass of this description made in England is produced; and that the average quantity of ashes sold there to smelters amounts as nearly as possible to 10,000 tons in the year: altogether, we feel quite safe in assuming 30,000 tons of brassfounders' ashes, at an aggregate value of L.15,000 to L.18,000, to be a pretty correct approximation to the produce of the country in this one item of the Dirt-washing trade. Ten years ago this 'refuse' was not simply an article of no value: it cost the brassfounders both money and trouble to get rid of it. There is a much greater difficulty in estimating the amount of ingot brass annually disposed of in the country; but we may state from what we do know, that a metal refiner in a very moderate way, employing, we shall say, three or four men, and conducting his business efficiently, will, as an ordinary result, produce brass to the value of L.1500 or L.2000 in the course of a year.

As if to preserve the character of this trade in its most curious feature, the smelters have in their turn a waste product, technically named 'slag,' which consists of the finer portions of the ashes separated in the last part of the washing process, together with the

irreducible matter taken from the surface of the melted metal while in the furnace. This commodity, from its siliceous composition, is considered valuable as a flux to the copper ore in the second process of smelting, and also from the minute proportion of copper it still contains. Large quantities of this slag, therefore, are annually shipped from the principal ports of the kingdom to Swansea, where it is usually consigned to copper-ore agents, and sold after the fashion of copper ores by public ticketing, realising generally from L.1 to L.2 per ton. It will easily be conceived, from the extensive ramifications of the trade, that a particle of Newcastle coke, which has passed through the furnace of a London or Edinburgh founder, may ultimately find itself, after innumerable washings and smelting, roasted to powder in the huge copper-ore furnaces of South Wales.

Brassfounders' borings, filings, and turnings, under the general term of 'brass-dust,' form a heavy and costly item in the smelting trade. Its average price is about L.25 per ton, and its produce of metal from two-thirds to three-fourths. This, however, is not invariably sold by brassfounders, many of whom prefer melting their brass-dust into ingots themselves; and it is to be remarked, that all smelters acknowledge that this article yields no profit in itself, although it serves to enhance the value of the metal produced from the ashes with which it is mixed and smelted, as we have already explained. The 'skimings' from crucibles, or oxide formed on the surface of the brass; shop-sweepings, which contain brass-dust; coppersmiths' ashes, filings, and refuse, with other articles of a similar nature purchased by smelters, belong to this department.

The next chief division of the trade consists in refining what are generally termed 'plumbers' ashes,' or that gray heavy-looking dross invariably formed on the surface of lead when melted. From the easily reducible nature of lead-ashes, they have always commanded a fair marketable value; although, so far as plumbers are concerned, their price has been nearly doubled within the last ten years by the competition among smelters. The cause of the formation of this refuse is very easily explained. Lead is one of that class of metals possessing a strong affinity for oxygen, more especially at a high temperature; and, consequently, whenever the heated surface of melted lead is exposed to the atmosphere, it becomes rapidly oxidised, and, according to the degree of heat employed, yields the protoxide from which is produced the litharge of commerce; and in combination with the sesquioxide, the well-known pigment of red lead. Under no circumstances, however, do plumbers require such high degrees of temperature; and the lead-ashes or dross they produce are only partially oxidised—consisting, in fact, of the protoxide with a moderate admixture of the pure metal.

This dross is separated from the surface of the melted lead, and laid aside for the smelters, who purchase it at an average rate of L.6 per ton. It is by them washed and smelted in a nearly similar manner to that already described, the only difference in the treatment being a second operation of refining. It is, after being washed, thrown into the furnace in the usual way by the charging-door—substituting, if necessary, for the last-named flux a moderate quantity of slaked lime; and after being reduced by the heat, is 'tapped' out of the furnace—that is, allowed to discharge from a small aperture at the bottom of the well, after the manner of melted iron—into a large iron pot, where the necessary heat is still preserved to keep it melted. There it is treated with resinous or fatty matters in a state of combustion, which has the effect of burning out many occasional impurities, such as zinc or tin, that may have resisted the heat of the furnace; but more especially it exercises a certain influence in softening the

lead: from this pot it is finally cast into large iron-bar moulds, and allowed to cool.

Much skill and ingenuity of treatment are required in the smelting and refining of lead-ashes, and in consequence there exist endless varieties and modes of manipulation among different smelters.

The grand desideratum is *soft* lead, as softness in this case is equivalent to value, hard lead being a most unsaleable commodity; and when the many impurities lead may contain is considered, it will be seen that this property is by no means of easy attainment. We have, however, seen different specimens of bar-lead produced in this manner, in no way inferior, in point of quality, to the best English bars in the market. Its commercial value is from 20s. to 30s. per ton below the price of new pig-lead.

We have more tangible grounds for arriving at the quantity of this article produced in the country than in the preceding case. Taking for the basis of our calculation the latest computation of the annual quantity of pig-lead smelted in the country at 50,000 tons; assuming it to be in the process of manufacture twice melted before it is finally disposed of; and placing the exports against the imports, together with the very large quantity of old lead constantly in the market, we arrive at a sum of 4000 tons of lead-ashes—value about £25,000 sterling—as the annual produce of the kingdom. We believe this to be nearly a correct estimate at the present moment; although, since the extensive introduction of rolled-lead in the plumbing trade (almost superseding the old method of casting sheet-lead), we have no doubt the aggregate produce of lead-ashes will have considerably decreased. Twenty years ago we should think the amount then produced exceeded the quantity we have named by at least one-half. The greater portion of lead-ashes is refined at Newcastle, where several eminent houses have their works. Indeed, as a general rule, all lead manufacturers refine their own ashes, and therefore the smelters have only comparatively a small share of this article. One individual in London, however, refines from 400 to 500 tons in the year; but we are not aware of any other who does business to the same extent.

The proportion of pure metal obtained from lead-ashes varies from 40 to 60 per cent. Messrs Campbell of Edinburgh, to whom we are indebted for much information on the subject, estimate the per-centage of their ashes, which they produce in large quantities at their lead works in Leith, at even a higher rate than this. It is surprising how closely this approximates to the produce of the sulphuret of lead or the galena of the mineralogists (by far the most ordinary description of lead-ore smelted in this country), which is computed to yield on the average about 80 per cent. of pure metal. The dross obtained from Spanish lead in this way is particularly rich in its produce. In connection with the lead trade are also several other commodities disposed of to smelters—such as tin-ashes, solder-ashes, zinc-ashes, &c., all of which are neither more nor less than oxides of their different metals, produced in the same way, and are treated in a precisely similar manner to that of the lead-ashes.

The next department we notice, although not large, is by no means unimportant: it consists of refining typefounders' dross, or the oxide formed on the surface of the type-metal, in the same manner as on lead. This is decidedly the hardest part of the smelting trade; and to refine the dross properly, a smelter of first-class capability is required. It is not only difficult to wash, but it is difficult to smelt, without losing the most valuable component of the alloy—namely, the antimony. The process, besides, is injurious to the workmen. The antimony (in combination with lead, constituting type-metal) is volatilised to a certain extent by the intense heat to which it is subjected; and whenever the furnace-doors

are taken off, or, more especially in the second process of refining, it escapes in a state of impalpable oxide, impregnating the atmosphere with that peculiar antimonious acid which forms the basis of the well-known and exceedingly powerful tartar-emetic. Severe vomiting, and even spitting of blood, followed by a protracted debility of the organs of the chest, we have known to result from a large melting of type-metal.

Regarding the produce of this dross we can hardly offer a definite idea, the per-centage of metal obtained is so very variable both in its quantity and quality. Even the best description of smelted type-metal is altogether unsuited to the purpose of casting types, and is for the most part used for quadrats and spaces—that is, the small slips of metal necessary to bind a column or page of type together, and which may be composed of an indifferent alloy. Its market-price varies from £1.14 to £1.20 per ton, though in some cases, if the quality be very superior, it will realise more.

The last notice on our list is that in connection with the dockyards, or, more properly speaking, that department of shipbuilding which comprehends the copperfastening of new, or the recoppering of old vessels. In the course of this operation, and more especially in a repair of this latter description, old copper-nails, stray pieces of bolt and sheet copper, with other parings of a similar nature, are lost among the chips, or in the bottom of the dock. These chips are sold at an almost nominal price, as rubbish, to the smelters, who cart them away often in large quantities, burn the chips out, then wash and smelt the remainder, if necessary, in the ordinary manner. This is considered to be the most profitable branch in the smelting trade (it is undoubtedly the least scientific), but of course is only peculiar to large seaport towns where shipbuilding flourishes. The government dockyards furnish also different descriptions of refuse from the various trades they may comprehend, as brass and copper-founders, and such like.

Throughout the whole process we have attempted to describe, it will be observed there exists a close analogy with the smelting of ores, whether regarded in its mode of treatment or in its produce. Indeed, from their striking similarity, and difference only in degree, we think Dirt-washing fairly entitled to be considered as a legitimate, although inferior branch of the smelting business of the country.

We wish to make a single observation with regard to the trade in a social point of view. The smelters are considered at this moment by the parties they deal with—such as brassfounders—as a class of persons essentially disreputable. In London and the provincial towns of England, they are invariably styled and known by the term of 'Dirt-washers;' and in Scotland they are generally associated in idea with dealers in old metal questionably obtained. One rather eminent founding house in Edinburgh habitually prevents any communication between the sellers and buyers, by shovelling their ashes, to the extent perhaps of twenty tons, through a hole in their back-door; and the reason assigned for this extraordinary mode of procedure, was the discovery they once made of an attempt at bribing their casters to put metal in the ashes. As an inviolable rule, the smelters are required to pay cash for the stuff, and this very often in advance for a year. Such treatment, it seems obvious, can result only from the ignorance and bad reputation of the men who originated the trade; but we have reason to know that it has now to a great extent passed into quite different hands. Not one in a dozen of the trade as it exists at present were regularly bred to it; and most of the master-smelters we know were led into it by the extravagant misrepresentations they had received of its profits. The mysteries of Dirt-washing, however, are now at an end; and its professors may henceforward lay aside the cunning pretexts on which some of them purchase their

materials. It is now pretty widely understood, we believe, that metallic ashes are not *rubbish* any more than rags; while, on the other hand, those who sell such refuse must be convinced that they receive a fair price for their commodity.

Let us add, however, that we wish to throw no stigma upon the dirt-washers as a body. We know many honest, upright, and by no means unintelligent persons who follow the trade—who possess a practical knowledge of the nature and relations of metals far exceeding that of the artificers from whom they purchase—who have enjoyed some curious experiences, moreover, in human nature in the course of their singular dealings—and who, it may be supposed, feel not a little sore at their very existence being so contemptuously ignored. On the whole, we shall not be sorry if our little *exposé* of the principles of metal-refining should have the effect of freeing the trade from whatever is occult and mysterious in its character, and raising it to a respectable, as it now seems to be an indispensable, branch of the national industry.

THE USURER'S GIFT.

A few months ago in London an old man sat in a large panelled room in one of the streets near Soho Square. Everything in the apartment was brown with age and neglect. Nothing more superlatively dingy could well be imagined. The leathern covers of the chairs were white and glossy at the edges; the carpet was almost of a uniform tint, notwithstanding its original gaudy contrasts; there were absurd old engravings upon the walls—relics of the infancy of the art; and curtains to the windows, which the smoke of years had darkened from a delicate fawn to a rusty chocolate colour. In the centre of the room, and as it were the sun of this dusty system, stood an office-table of more modern manufacture, at which was seated the old man alluded to, sole lord and master of the dismal domicile. He was by profession a money-lender. His age might be from sixty to sixty-five years; his face was long, and his features seemed carved out of box-wood or yellow sandstone, so destitute were they of mobility; his eyes were of a cold, pale, steel colour, but his brows were black and tufted like a grim old owl's; a long aquiline nose, a thin and compressed mouth, and a vast double chin, buried in a voluminous white neckcloth of more than one day's wear, completed the portrait. Nor did the expression of his countenance undergo any perceptible change as, after a timid knock, the door opened, and a young man entered of singularly interesting appearance.

The new-comer was well-dressed, though his clothes were none of the newest, and had the air of a man accustomed to society. His pale brow was marked with those long horizontal lines of which time is rarely the artist. His dark, deep-set gray eyes flashed with a painful brightness; his long chestnut hair, damp with perspiration, clung in narrow strips to his forehead; his whole manner implied the man who had made up his mind to some extraordinary course, from which no wavering or weakness on his part was likely to turn him aside, whatever the opposition of others might compel him to abandon or determine. Bending his tall figure slightly, he addressed the money-lender in a tone of constrained calmness.

'You lend money, I believe?'

'Sometimes—on good security,' replied the usurer indifferently, forming a critical summary of his visitor's costume at a glance.

The stranger hesitated: there was a discouraging sort of coldness in the mode of delivering this answer that seemed to prejudice his proposition. Nevertheless,

he resumed with an effort—'I saw your advertisement in the paper.' The usurer did not even nod in answer to this prelude. He sat bolt upright in his chair, awaiting further information. 'I am, as you will see by these papers, entitled to some property in reversion.'

The usurer stretched out his hand for the papers, which he looked over carefully with the same implacable tranquillity, whilst his visitor entered into explanations as to their substance.

Once only the money-lender peered over the top of a document he was scanning, and said gruffly: 'Your name, sir, is Bernard West?'

'It is,' replied the stranger, mechanically taking up a newspaper, in which the first thing which caught his eye was the advertisement alluded to, which ran thus:—'Money to any amount advanced immediately on every description of security, real or personal. Apply between the hours of ten and five to Mr John Brace, — Street, Soho Square.'

After a brief interval of silence, the usurer methodically rearranged the papers, and returned them to the stranger. 'They are of no use,' he said—'no use whatever: the reversion is merely contingent. You have no available security to offer?'

'Could you not advance something upon these expectations—not even a small sum?'

'Not a farthing,' said the money-lender.

'Is there no way of raising fifty—thirty—even twenty pounds?'

said the stranger anxiously, and with the tenacity of a drowning man grasping at a straw.

'There is a way,' said the usurer carelessly. West in his turn was silent, awaiting the explanation of his companion. 'On personal security,' continued the latter with a sinister impatience, beginning to arrange his writing materials for a letter.

'I will give any discount,' said the young man eagerly. 'My prospects are good: I can'—

'Get a friend to be security for the payment of the interest?'

'Of the interest and principal, you mean?'

'Of the interest only—and the life insurance,' added the usurer, with a slight peculiarity of intonation that might have escaped the notice of one whose nerves were less exalted in their sensitive power than those of his visitor's.

'And what sum can I borrow on these terms?'

said West gloomily.

'A hundred pounds: more if you require it. In fact, any amount, if your security be good.'

'The interest will doubtless be high?'

'Not at all: four or five per cent. As much is often given for money on mortgage of land.'

'And the life insurance?'

'You will insure your life for five hundred pounds, and you will pay the premiums with the interest.'

'For five hundred?'

said West hesitating. 'That is, if I borrow'—

'One hundred,' replied the usurer sharply. 'Men who lend money do not run risks. You may die, and four out of five insurance offices may fail; but the chances are that the fifth would pay.'

'But it is not likely'—began Bernard West, amazed at this outrageous display of caution.

'I do not say it is likely,' snarled the usurer with a contemptuous sort of pity for his visitor's dulness of apprehension; 'I say it is possible; and I like to be on the safe side.'

'Well, and how is the affair to be arranged?'

'Your security, who of course must be a person known to have property, will give a bond guaranteeing the regular payment of interest and premiums—that is all.'

West reflected for some minutes in silence. The faint expression of hope that had for an instant lighted up his countenance vanished. He understood the

money-lender and his proposition. A sufficiently clear remembrance of the tables of life assurance which he had seen, enabled him to perceive that the interest and premiums together would amount to nearly twenty per cent., and that the bond engaged his security to pay an annuity for his (West's) life of that amount. It is true that, full of energy and hope, he felt no doubt of his capacity to meet the payments regularly: it is true that, monstrous as were the terms, he would have accepted eagerly still harder ones, had it simply depended on his own decision. But where find, or how ask, a friend to become his bondsman? He ran over in despair the scanty list of acquaintances whom his poverty had not already caused to forget him. He felt that the thing was impossible. There was not one he could think of who would have even dreamed of entering into such a compact. He turned desperately to the money-lender.

'I have no friend,' he said, 'of whom I could or would ask such a service. If I had, I should not be here. Are there no terms, however high, on which you can lend me even the most trifling sum, for which I myself alone need be responsible?'

'None,' replied the usurer, already commencing his letter.

'I will give thirty per cent.?'

'Impossible.'

'Fifty?'

The usurer shook his head impatiently.

'A hundred—cent, per cent.?'

'No!'

The strange seeker of loans at length rose to depart. He reached the door. Suddenly he turned back, his eyes blazing with the sombre radiance of despair. He strode up to the table, and planted himself, with folded arms, immediately in front of the usurer.

'Mark me!' said West in a tone of deep suppressed passion, like the hollow murmur of the sea before a storm: 'It is a question of life or death with me to get money before sunset. Lend me only twenty pounds, and within twelve months I will repay you one hundred. I will give you every power which the law can give one man over another; and I will pledge my honour, which never yet was questioned, to the bargain!'

The usurer almost smiled, so strangely sarcastic was the contraction of his features, as he listened to these words.

'I do not question your honour,' he said icily, 'but honour has nothing to do with business. As for the law, there is an old axiom which says, Out of nothing, nothing comes.'

Bernard West regarded the cold rocky face and the passionless mouth from which these words proceeded with that stinging wrath a man feels who has humiliated himself in vain. Nevertheless he clung to the old flinty usurer as to the last rock in a deluge, and a sense of savage recklessness came over him when he advanced yet closer to the living cash-box before him, whilst the latter shrank half terrified before the burning gaze of his visitor's dilated pupils.

Laying his hand upon the money-lender's shoulder, by a gesture of terrible familiarity that insisted upon and commanded attention to his words, West spoke with a sudden clearness and even musical distinctness of utterance that made his words yet more appalling in their solemn despair—'Old man, I am desperate; I am ruined. It is but a few months since my father died, leaving me not only penniless, but encircled by petty obligations which have cramped every movement I would have made. I have had no time, no quiet, to make an effort such as my position requires. This day I have spent my last shilling. I am too proud to beg, and to borrow is to beg when a man is known to be in real distress. Within one hour from this time I shall be beyond all the tortures of a life which for my

own sake I care little to preserve. And yet I have spent my youth in accumulating treasures, which but a brief space might have rendered productive of benefit to man, and of profit to myself. My father's little means and my own have vanished in the pursuit of science, and in the gulph of suffering more immediate than our own. If I die also, with me perish the results of his experiments, his studies, and his sacrifices. There are moments when all ordinary calculations and prudence are empty babblings. Life is the only real possession we have, and death the only certainty. Listen! I will make one last proposal to you. Lend me but ten pounds—that is but ten weeks of life—and I swear to you that if I live, I will repay you for each pound lent not ten or twenty, but one hundred—in all, one thousand pounds! Grant that it be but a chance upon the one hand, yet, upon the other, how small is the risk; and then, to save a human life—is not that something in the scale?' And the stranger laughed at these last words with a bitter gaiety, which caused a strange thrill to creep along the nerves of the usurer.

However, the lender of gold shrugged his shoulders without relaxing his habitual impassability of manner. He did not speak. Possibly the idea occurred to him that his strange client meditated some act of violence upon himself or his strong box. But this idea speedily vanished, as the stranger, relapsing suddenly into silence and conventional behaviour, removed his hand from the usurer's shoulder, and strode rapidly but calmly from the apartment.

The door closed behind the ruined man, and the usurer drew a long breath, whilst his bushy brows were contracted in a sort of agony of doubt and irresolute purpose.

Meanwhile Bernard West paused for an instant on the threshold of the outer-door, as if undecided which road to take. In truth all roads were much alike to him at that moment. Some cause, too subtle to be seized by the mental analyst, determined his course. He turned to the right, and strode rapidly onwards.

He felt already like one of the dead, to join whom he was hurrying headlong. He looked neither to the right nor to the left; and before him was a mist, in which the phantoms of his imagination disported themselves, to the exclusion of all other visible objects. Nothing earthly had any further interest for him. He did not even hear the steps of some one running behind him, nor hear the voice which called after him to stop; but his course was soon more effectually arrested by the firm grasp of a man's hand, which seized him by the arm with the force and the tenacity of a vice.

He turned fiercely round. He was in no humour for the converse of casual acquaintances. Nor was it any gay convivialist of happier days whose face now greeted him: it was the old money-lender, who in a voice husky with loss of breath, or possibly emotion, said, thrusting a couple of twenty-pound bank-notes into West's hand—

'Here! take these notes. Take them, I say!' he repeated, as the young man, dizzy with amazement, stammered out—

'You accept, then, my terms?'

'No!' growled the usurer, 'I give them to you. Do you understand me? I say I give them to you. I am an old man; I never gave away a shilling before in my life! Repay me if you will, when and how it please you. I have no security—I ask no acknowledgment; I want none. I do not count upon it. It is gone!' and the usurer pronounced the last words with an effort which was heroic, from the evident self-mastery it cost him. 'There! go—go!' he resumed, 'and take an old man's advice—Make money at all hazards, and never lend except on good security. Remember that!' The old man gently pushed West away, and all hatless and slippered as he was, ran back muttering to his den, leaving the object of his mysterious generosity fixed

like a statue of amazement in the centre of the pavement.

About three months had elapsed, when Bernard West once more knocked at the door of the money-lender.

'Is Mr Brace at home?' he inquired cheerfully.

'Oh! if you please, sir, they buried him yesterday,' replied the servant, with a look of curiously-affected solemnity.

'Buried him!' cried the visitor with sincere disappointment and grief in his tone.

'Yes, sir; perhaps you would like to see Miss Brace, if it's anything very particular?'

'I should, indeed,' said West; 'and when she knows the cause of my visit, I think she will excuse the intrusion.'

The servant gave an odd look, whose significance West was unable to divine, as she led the way to her young mistress's drawing-room.

West entered timidly, for he doubted the delicacy of such a proceeding, though his heart was almost bursting with desire of expansion under the shock just received. A beautiful and proud-looking girl of nineteen or twenty years rose to meet him. Her large blue eyes, which bore traces of many and recent tears, worked strangely upon his feelings, already sufficiently excited.

'I came,' he said in his deep musical voice, 'to repay a noble service. Will you permit me to share a grief for the loss of one to whom I owe my life—yes, more than my life!' West paused, and strove vainly to master the emotion which checked his utterance.

'My father rendered you a service?' said the young lady eagerly, regarding with involuntary interest the noble countenance of Bernard, which, though it still bore traces of great suffering, was no longer wild and haggard, as at his interview with the money-lender.

'A most unexpected and generous service,' replied West, who, softening down the first portion of the scene we have described, proceeded to recount to the fair orphan the narrative of the great crisis in his destiny.

'I knew it was so!' cried the young lady almost hysterically affected; 'I knew he was not so grasping—so hard-hearted, as they said—as he himself pretended. I knew he had a generous heart beneath all his seeming avarice! Oh, you are not the only one doubtless whom he has thus served!'

West did not discourage the illusion. Nay, the enthusiasm of the charming woman before him was contagious. 'Thanks to your father's disinterested liberality,' he resumed, 'I am now in comparatively prosperous circumstances. I came not merely to discharge a debt; believe me, it is no common gratitude I feel! Doubtless you inherit all your father's wealth—doubtless it is but little service I can ever hope to render you. Yet I venture to entreat you never to forget that you possess one friend of absolute devotion, ready at all times to sacrifice himself in every way to your wishes and to your happiness.'

West paused abruptly, for the singular expression of the young lady's features filled him with astonishment.

'You do not know, then?'—she began.

'Know what?'

'That I—am a—a natural child!' she completed with a crimson blush, turning away her head as she spoke, and covering her face with her hands—'that I am without fortune or relations; that my father died intestate; that the heir-at-law, who lives abroad, and without whose permission nothing can be done—moreover, who is said to be a heartless spendthrift—will take all my father leaves; that I have but one more week given me to vacate this house by the landlord; in short, that I must work if I would not starve; that, in a word, I am a beggar!' And the poor girl sobbed convulsively; whilst Bernard West, on whom this speech acted as some terrible hurricane upon the trees of a tropical forest, tearing up, as it were, by the roots, all

the terrible stoicism of his nature, and rousing hopes and dreams which he had long banished to the deepest and most hopeless abysses of his soul; whilst Bernard, we repeat, ventured to take her hand in his own, and calm her painful agitation by such suggestions as immediately occurred to his mind.

'In the first place,' he said, 'my dear Miss Brace, I come to repay to you your father's generous gift.'

'It belongs to his legal heirs. I cannot receive it with honour,' said the money-lender's daughter firmly.

'Not so,' replied West gravely: 'it was a free gift to me. I repay it by a natural, not a legal obligation; and he laid the two twenty-pound notes upon the table. 'Next,' he resumed, 'I have to pay a debt of gratitude. I owe my life to your father. Thus in a manner I have become his adopted son. Thus,' he continued impetuously, 'I have a right to say to you, regard me as a brother; share the produce of my labour; render me happy in the thought that I am serving the child of my benefactor! To disdain my gratitude would be a cruel insult.'

'I cannot disdain it!' exclaimed the daughter of the usurer with a sudden impulse of that sublime confidence which a noble and generous soul can alone inspire. 'Yes—I accept your assistance!'

The face of Bernard brightened up, as if by an electric agent. But how were the two children of sorrow confounded by the discovery that they were no longer alone, and that their conversation had been overheard by an utter stranger, who, leaning against the wall at the farther end of the room, near the door, appeared to survey them with an utter indifference to the propriety of such behaviour!

He was a man of between forty and fifty years; a great beard and moustache concealed the lower part of a swarthy but handsome countenance of rare dignity and severity of outline. His dress was utterly un-English. A vast mantle, with a hood, fell nearly to the ground, and he wore huge courier's boots, which were still splashed, as if from a journey. His great dark eyes rested with an expression of royal benevolence upon the two young people, towards whom he advanced with a courteous inclination, that, as if magnetically, repressed Bernard's first indignant impulse.

'I am the heir-at-law,' he said in a mild voice, as if he had been announcing a most agreeable piece of intelligence.

'Then, sir,' said Bernard, 'I trust'—

'Trust absolutely!' interrupted quickly the foreign-looking heir. 'My children, do you know who I am? No? I will tell you. I am a monster, who in his youth preferred beauty to ambition, and glory to gold. For ten years after attaining manhood I struggled on, an outcast from my family, in poverty and humiliation, without friends, and often without bread. At the end of five more years I was a great man, and those who had neglected, and starved, and scorned me, came to bow down and worship. But the beauty I had adored was dust, and the fire of youthful hope quenched in the bitter waters of science. For ten years since I have wandered over the earth. I am rich; I may say my wealth is boundless; for I have but to shake a few fancies from this brain, to trace a few ciphers with this hand, and they become gold at my command. Yet mark my words, my children! One look of love is, in my esteem, worth more than all the applause of an age, or all the wealth of an empire!' The dark stranger paused for an instant, as if in meditation, then abruptly continued: 'I take your inheritance, fair child!—I rob the orphan and the fatherless!—and the smile of disdainful pride which followed these words said more than whole piles of parchment renunciations as to his intention.

Involuntarily the orphan and Bernard seized each a hand of the mysterious man beside them, who, silently drawing the two hands together, and uniting them in

his own, said gently, 'Love one another as you will, my young friends, yet spare at times a kind thought for the old wandering poet! Not a word! I understand you, though you do not understand yourselves. It is as easy to tell a fortune as to give it.'

And was the prophecy realised? asks a curious reader. But no answer is needed; for if the prophecy were false, why record it? And, pray, who was the stranger, after all? Too curious reader!—it is one thing to tell stories, and another to commit breaches of confidence.

THE SHEEP-FARMER IN AUSTRALIA.

[In the number for October 12, 1850, a paper appeared describing the emigrant's *town* life and prospects: the following narrative, the genuine experiences of a squatter, may serve as a completion of the subject, by describing life in the bush.]

AND now, Jabez, remember; at sunrise you all meet here. The bullock-drivers with the drays will be ready, and you must see that Maenell and Smith are punctual: start as soon as you get together, and try if you can't get eight miles nearer Sandy Creek by sundown. Mr Brown and myself will overtake you by mid-day—and mind you look well after the men, as well as the jumbucks.* Such was the conclusion of a series of directions given to a confidential shepherd on a station about forty miles from Melbourne, Port Philip, by Frank Woodman, a young man of five-and-twenty, whose bushy beard, and brawny figure attired in canvass trousers, round white jacket, and cabbage-tree hat, bespoke the squatter; while his sunburnt features and hard hands bore witness to exposure and toil, which had doubtless tasked even his sinewy frame and broad shoulders to their utmost.

Frank was the fourth son of an attorney in good practice in Devonshire, who gave him a sound education at a grammar-school in the neighbourhood, and then placed him in the office, where he spent two years. But the law was not to his taste; a few months in the surgery of an elder brother gave him an equal dislike to physic; and on the 8th of June 1842, he sailed for Sydney with £500 in his pocket, with liberty to draw on his father for a like sum. As to the pursuits he was about to follow, he knew nothing: his ideas of colonial life were very indistinct; he contented himself with the axiom—'What man has done, man may do.' He intended to try sheep-farming, and fare as others had fared before him; he felt himself inexperienced, but trusted to youth and perseverance to turn the scale in his favour. The ship in which he sailed touched at Melbourne, Port Philip—then comparatively an infant settlement; and here, having met with a friend he had known at home, he was induced to remain, giving up altogether the idea of proceeding to Sydney. In a few weeks he purchased a third of a small sheep-station about forty miles from Melbourne: his share was a flock of about 500 sheep, with their 'run,' or right of pasturage, for which he gave 2s. per head; and he became joint-occupier of his partner's hut, and set to work in earnest as a 'squatter.' Whatever his expectations may have been with regard to the privations and discomforts of the life he had chosen, it must be confessed that those expectations fell far short of the reality. The hut which was now to become his home was built entirely of bark—bark walls, bark roof, and even bark chimney. A few upright poles are driven into the ground at certain distances; across these are lashed one or two horizontal ones to strengthen the uprights; the bark, stripped from the box or stringy bark-trees in sheets about six feet long by three broad, is tied on with narrow strips of the same material: the chimney, shaped like one of the old-fashioned chimneys

still met with in farmhouses in England, is placed at one end, from which it stands out its whole depth: an extra pole or two is lashed on to the roof to keep the covering in place; and behold the bark-hut of the squatter! In this instance the hut was about sixteen feet by twelve, and consisted of but one room, 'parlour, and kitchen, and hall,' and was indeed occasionally their killing-house in addition. Upon two cross bedsteads, one in either corner farthest from the fire, did Frank and one of his partners rest respectively their weary limbs each night; the third resident occupied a hammock slung above. Tea, mutton, and 'damper'—damper, mutton, and tea, three times a day, was their simple diet—digestion assisted of course by the never-failing pipe; not that which Corydons of old considered a necessary appendage to pastoral pursuits, but a short, black-looking affair, like the Irish dudheen, in which was consumed real American negrohead in unlimited quantities. At this station Frank remained about twelve months, working very hard; up each morning before sunrise—often his own shepherd, always his own laundress, and of course his own cook. But he gained little by his work save in point of experience; his flock turned out to be two-thirds wethers, so it was not a fast-increasing one; and as his partners were not overfond of work, and were willing to allow him more than his due share of that article, he resolved to break off the connection, and purchased the right of a small neighbouring run. In the colony, runs are transferred *with stock*. In this case he ostensibly bought two cows, for which he gave £100; and with the cattle, the run or right of pasturage was given in. Here, in December 1843, he drove his little flock, and here he built a slab-hut. This is of a superior description to the bark-hut, and has a much neater appearance. The walls are formed, as its name imports, of slabs of wood, partially smoothed with the adze, and the roof covered with shingles, or smaller slabs of the same material, laid on in the manner of slates. This hut, like the last, consisted of but one room; but it was thirty feet long, and proportionately broad, and outbuildings were attached, so that it appeared a great improvement on his previous habitation.

Here also our colonist laboured very hard. He employed two shepherds (each having his 'hut-keeper,' whose province it was to cook the provisions, and take charge of the sheep by night, when brought in and folded), and a bush-carpenter to fell timber, and construct his buildings, fences, &c. With this latter man he worked as 'mate' day after day for some months, and had, in addition to his bodily labour, the anxiety of mind attendant upon frequently-recurring casualties in his flock. His run was what is termed a 'rangy country,' intersected at intervals by ranges of high hills, with other smaller ranges running out of these at right angles; so that if the sheep spread much while feeding, they were soon out of sight, and consequently many were lost, and when thus separated from the flock, easily fell a prey to the native dogs, which in this district were very numerous and destructive. This native dog, the great pest of the sheep-farmer, is an indigenous animal, about twice the size of a fox, with perhaps a greater likeness to the wolf; it destroys almost every animal it meets with, foals and calves often falling a sacrifice to its voracity: but stray sheep are its peculiar prey. On one occasion Frank found that when the sheep were brought in and folded, that some 300 were missing: a useless search was immediately instituted, which was renewed at day-break with some anxiety for the fate of the missing; and with great reason, for upwards of 200 were found dead and dying—all more or less mutilated, and some partly devoured. Such casualties (of course in a less

* Sheep.

* 'Damper.' To a thin cake made from flour and water, and baked in wood-ashes, is given this somewhat expressive appellation.

degree) were continually occurring; and this caused another difficulty to arise: no shepherd would remain his term of service when he found that, with the greatest care, some of his flock were so often missing at the evening count.

All this was harassing in the extreme to Frank; indeed he was sometimes tempted to despair when he found, on visiting his flock, that not only were sheep missing, but that their shepherd had started too. Pecuniary matters just at this time presented an unfavourable aspect: it was not to be expected that with the necessary outgoings on the one hand, and very little increase in his flock on the other, the affairs of our settler could be in a very flourishing condition: indeed he found his capital quickly diminishing, and the balance with his agent at Melbourne very nearly nil, or even sometimes that it appeared upon the wrong side of the books. It was therefore not surprising if, with all his endurance taxed to the utmost, poor Frank Woodman began somewhat to despond. Thoughts of home, and of the comforts he had voluntarily left behind, were continually intruding themselves; and nothing short of the indomitable perseverance of the Saxon race, and some natural dislike to return to his friends with only a tale of disaster and disappointment, could have carried him through this period of his adventures. It was this succession of difficulties that induced him, after a two years' trial at this station, to entertain the idea of trying a run in a new country—that is, in a part not yet settled; and on his next journey to Melbourne with his wool, he commissioned a man of some experience to inspect for him certain land situated at some distance in the interior, of which he had heard good report. A friend who had come out to the colony with him, and to whom he now communicated his views, agreed to join him in his enterprise, if an eligible run up the country was to be had; and upon receiving from their agent a favourable account of some unsettled land upon the Henry River, at a distance of about 260 miles from Melbourne, the friends agreed to 'chance it,' as the colonial phrase has it, and start for 'fresh fields and pastures new,' as soon as the necessary arrangements could be made.

The first step was to advertise the run which Frank Woodman now held; and soon, among various other 'desirable runs' and 'eligible investments' which figured in the columns of the 'Melbourne Morning Herald,' might have been read the following:—'Jerry's Creek. To be sold, a part of the stock, with run, at this eligible station, only forty miles from town. For further particulars inquire at Mr Simmons's offices, 24 George Street, Melbourne.' In a few weeks a bargain was struck with a settler who had previously formed too close an acquaintance with swampy plains in his run, and who looked with a favourable eye on the high ground of the ranges on Jerry's Creek. Frank sold him seven rams for £240, and with them transferred the right of run, and all the 'improvements'—that is, the buildings, fences, &c. on the station. It was arranged that Frank's horses, sixteen in number, were to be left with a friend for a time; and the sheep, numbering now 1500, together with a flock of the same number belonging to Frank's friend and now partner, Mr Jones, were to be driven to the new station, wherever it might prove to be.

Preparations were now made for the journey: several fresh hands—hut-keepers and shepherds—were hired; and two new drays were purchased, and loaded with necessaries for twelve months, together with a few articles of furniture, and saddles, ironmongery, and tools, &c. necessary for an out-station. Each dray cost them £17, and the bullocks (eight to each dray) £9 per pair. The dray, the usual means of transport in the colony, in which the wool is sent to town, and provisions taken back, is a low vehicle, very similar to our brewer's dray. The bottom is made of slabs, some few

inches apart, and iron pins and rail form the sides. When laden, a tarpauling is usually placed over the goods, long enough to hang over the sides and reach the ground. These ends are rolled up when the dray is in motion; and at night, or when a halt occurs, they are let down, and then form a sort of tent, under which the men sleep, perfectly protected from the weather.

At sunrise on the 8th January 1846, being the day succeeding that upon which our narrative opened, might have been seen passing the boundary of the Jerry's Creek run, the following company:—First marched the bullock-teams, three in number, with their heavy drays, apparently well laden, and covered with the stout tarpauling before spoken of—the drivers seeming to vie with each other in trying who could produce the greatest amount of noise with their whips, the lashes of which are usually formed by strips of silk handkerchief plaited and fastened to the thongs. These, so finished, produce a *crack* which may be heard at a great distance; and so fond are the drivers of the noise, that one zealous in his vocation will often lay in a stock of three or four handkerchiefs specially for the service of one long journey; and even then, before he reaches his destination, is often necessitated, his silk being expended, to use a lash made of the hairs drawn from the tails of his bullocks. This produces a less sharp sound than one of silk, but is much preferred by him to none at all; for as a recruiting-party without the drum and fife would be shorn of its chief attraction, so would the dignity of the bullock-driver be shorn were he compelled to enter his market-town without his peculiar noisy accompaniment. In close attendance upon the bullock-drivers walked two hut-keepers, whose duty on the journey it was to cook and get everything ready at each stoppage; and, lastly, came the sheep in one flock, with the three shepherds and their numerous dogs, of all sizes and breeds. The roads in this part of the country, especially at some distance from the market-towns, are merely the tracks of the drays passing over the turf, and in wet weather are almost impassable; it being no unfrequent occurrence for the driver and his assistant to be under the necessity of digging a passage for the wheels of his dray from out a rut, from the depths of which the whole strength of the bullocks failed to extricate the heavy vehicle. At this season, however (the midst of summer), the roads were hard and good, and in about two hours and a half the drays had arrived at the end of their first day's journey—about seven miles. They were drawn up in a triangle, with space between them sufficient to fold the sheep; the bullocks were suffered to graze, the tarpaulings were unrolled, and the cooking began. Soon after Frank and his partner arrived on horseback at the halting-place, and were soon reclined at length under the welcome shade of some trees by the river bank, beguiling the time until the arrival of the sheep with a pipe, and the interchange of hopes and fears for the future. The sheep, which fed as they went, and which 'camped' (that is, lay down in a body in the shade) during the hottest part of the day, and could only travel morning and evening, arrived a short time before sundown, when they were folded, and all the bipeds were soon deep in the discussion of dinner; and after the usual solacing pipe and some quart-pot tea,* all parties betook themselves to slumber, chiefly underneath the shelter of the drays.

The next morning's sunrise found them all stirring: horses were caught and saddled for the masters; bul-

* A necessary part of the outfit of the traveller in Australia, is a quart tin cup or pot, and a pannikin of the same material; and one of the first proceedings upon a halt, after a fire is made, is to use them thus:—The pot is filled with water, and placed upon the fire. When the water is unmistakably boiling, a liberal pinch or two of tea is thrown in, the pot removed from the fire, and the pannikin placed on the top. By the time the tea has all sunk to the bottom, the beverage is fit to drink.

locks were found and harnessed; again was heard the crack! crack! of the drivers; and accompanied with the bleating of the sheep, the barking of dogs, and the shouts of the men, once more the cavalcade moved on, again to follow the same course as that of the preceding day. Thus journeying onward, with but little variation, they came on the fourth day to the point where the river was to be crossed: the sheep were to be ferried over; and this was necessarily a work of time, as only thirty could be conveyed at once; and often much difficulty was found in getting them into the boat: however, at the end of the second day, all were safely at the other side, without any casualty of consequence. Frank met with a ducking in attempting to swim his horse over; the animal, unused to the adventure, when in the middle of the stream, tried to find bottom, but as the river was nearly thirty feet deep here, of course he was disappointed; and, in revenge, began to plunge, and slipped his rider off. Frank, however, still holding by the bridle, struck out manfully for the shore, which he reached safely, when he again mounted the refractory animal, and succeeded this time in the attempt to cross. This horse never afterwards refused to take the water, an accomplishment highly necessary in a country where bridges are scarce, and fords are often somewhat dangerous, from the swollen state of the rivers.

Monotonous as must be a journey of many weeks with stock, creeping on, as it were, but six or eight miles a day; yet a great interest, an indescribable charm, and an air of romance belongs to the undertaking, which none can fully appreciate without actual experience. At first the stock require a good deal of attention to keep them together; but as the journey proceeds, less care is needed; and the tedium may be lessened by an occasional exploration of the country around the track, as well as the diversion afforded by the use of the gun or rod, or a kangaroo hunt now and then, to those fond of the sport. To each station on the route, of course a passing visit is paid; and, just as much of course, is a welcome found: the scenery, too, is constantly varying; and although it must be confessed that its prevailing character is gloomy, still many a fertile plain and creek breaks upon the view as the journey lengthens, and thus much of its monotony is relieved. Its end, too, is never lost sight of; and speculations as to the character and appearance of the unknown goal, always keep alive the interest and excitement. Altogether, notwithstanding its hardships and trials, a journey of this kind is ever looked back upon with some measure of pride and satisfaction, and its incidents and its mishaps form the subject of many a future yarn.

Perhaps the greatest difficulty they experienced in this journey was met with when, in order to save a considerable distance, they left the banks of the river, and crossed some twenty miles of plain. This was a serious undertaking, there being no water the whole distance, and at that season of extreme heat, the sheep would scarcely travel without drinking; and on the second day of this 'passage of the plains,' it was by incessant exertions only that the tired animals could be made to move; for every few minutes the disposition to 'camp' shewed itself, and had to be prevented. Towards sundown, however, the welcome note of the bell-bird* was heard, and soon after the instinct of the sheep discovered the proximity of the stream: now the only difficulty was to restrain their course; they rushed forwards at full gallop, overturning, and running great risk of drowning one another in their eagerness.

As time wore on, the working bullocks became very fresh, having but six or eight miles per day to do: they often wandered so far during the night that some hours

of the morning were spent in recovering them. Indeed on one occasion a whole day passed in fruitless search, and the sheep were of necessity driven back to the place of the previous night's encampment. The greatest part of the next day was consumed in scouring the country; but towards evening, as our colonist, after having ridden some sixty miles, was returning, wearied and anxious, from his bootless errand, he happened to spy the runaways, quietly making the most of a little bit of sweet pasture entirely surrounded by scrub—a sort of oasis in the desert: it needs scarcely be said that the crack of the stock-whip soon roused them from their enjoyment, and in a few moments they were galloping, heads instinctively turned towards 'camp,' from which it proved they were but a few miles all the time, with their now delighted master close upon their quarters. It was now, however, too late to proceed on their route, so that they encamped three nights on the same spot on this occasion. This was the only time that so long a delay arose from this cause.

As they proceeded further up the country, stations become more unfrequent; and on the 20th of February they lost all traces of the road, or track made by the passage of drays to and from the several stations. They had now come close upon the unoccupied land of which they were in search; and taking provisions for three days with them, Frank and his agent rode forward upon an exploring expedition. It must be confessed that the further acquaintance with the country thus formed did not at first prepossess in its favour; a great part, perhaps one third, was unavailable for the purpose of pasturage, being covered with thick scrub, and the grass on the plains was quite blanched and dry with the intense heat. (They were now, it must be recollected, in the midst of summer, and the thermometer averaged 98° to 120°.) The river, now low, and fordable in most places, shewed, however, that its breadth in winter was much increased, and there was a tolerable supply of timber—the usual iron-bark, stringy-bark, and gum-trees—on and near its reedy banks. Whenever the bush did not intercept the view, the eye traversed a seemingly boundless plain, intersected by a few ranges of low hills, at a considerable distance apart. But to the experienced squatter the picture was not gloomy, nor the view uninteresting. He could see that the feed was likely to prove good for sheep and cattle: the river, now at its lowest, would at all times afford plenty of that absolute necessary in such a climate—water; the scrub would give shade; and in the unpicturesque flatness he saw but the facility for running his sheep in large flocks, with but little trouble and expense. Frank had before quite enough of a rangy country; and with regard to his other pest, the native dogs, he had learned at the stations he had lately passed that the dogs, never so troublesome as in many parts, were lessening in number every year: the native inhabitants, he was told, were few, and those disposed to be friendly and useful: none had been seen as yet. After three days' survey, they returned to camp, with a determination to fix their lot on that run, and to do their best endeavour to turn that unfriendly wilderness into a home, that barren flat into a source of profit and independence.

FUNERAL CYPRESS.

Amongst recent importations of hardy ornamental evergreens, calculated to afford hereafter a new feature in our garden and landscape scenery, there is nothing to rival this beautiful tree. The traveller who appears originally to have noticed the funeral cypress (*Cupressus funebris*), or at least the first who has left any recorded facts in relation to it, was Sir George Staunton, when exploring China in the embassy of Lord Macartney. Subsequently, however, Mr Fortune met with it near the celebrated tea-country of Whey Chow; and through the interest of that gentleman, Messrs Standish and Noble,

* A bird with a peculiarly musical note, never heard but in the vicinity of water.

of the Bagshot Nurseries in Surrey, have been enabled to import both seeds and young plants. Mr Fortune describes this weeping cypress as quite new; it is a noble-looking fir-tree, about sixty feet in height, having a stem as straight as the Norfolk Island pine, and pendulous branches like the weeping willow. The branches grow at first horizontally with the main stem, then describe a graceful curve upwards, and droop again at the points. From these main branches, others, long and slender, hang down towards the ground, and give the whole tree a weeping and graceful form. It is also very symmetrical, and reminds one of a large and gorgeous chandelier. In regard to its effect in scenery, Mr Fortune remarks:—'It has a most striking and beautiful effect upon the Chinese landscape, and in a few years the same effect will doubtless be produced by it upon our own. It will be particularly valuable for park scenery, for lawns, for the entrance to suburban residences, and as an ornament for our cemeteries. I have no doubt that it is quite as hardy as *Cryptomeria japonica* and the Indian Deodar, and will be a fit companion for both in our parks and pleasure-grounds.' The fact of its being perfectly hardy, as conjectured by Mr Fortune, has now been perfectly established: hundreds of young plants have stood the past winter uninjured in the Bagshot Nurseries; some young seedlings, in a growing state, were removed from a cold house to the open ground without protection, and subjected to eight degrees of frost, in the first week in May, without injury.

A CLOAK BOAT.

A cloak boat, manufactured of India-rubber, from the design of Lieutenant R. A. Halkett, R.N., by Mr Matthews of Charing-Cross, has been thus experimented with:—A blue cloak, of the Macintosh make, was laid on the floor of a shed, the outside being next the door, and a wicker sort of mat was deposited on it, which formed a flat bottom, the cloak having an air-proof cylinder; and within one minute it was thoroughly inflated, and thus suddenly metamorphosed into a boat, glided into the water, a gentleman being seated in it, and rowing at different intervals with a couple of hand-paddles, shaped like looking-glasses. This boat is extremely serviceable to persons travelling, for the purpose of crossing rivers or streams where no other means are at hand. It is instantly available, and can, in cases of necessity, be converted into an excellent bed. The weight of this kind of boat, with bellows and paddles, is about nine pounds. An umbrella, to act as a sail, can also be furnished if required.

GRASS-CLOTH OF INDIA.

Dr H. Clehorn has illustrated to the British Association the economy of the grass-cloth (*Chū Inā*) of India. The author stated that several species of plants belonging to the order *urticaceæ* were employed in Hindoostan for yielding fibres used in the manufacture of textile fabrics. He exhibited several articles of dress, very white and light, which were made from the fibres of an urticaceous plant, the *Bahmeria nivea*. Mr Gourlie of Glasgow stated that we knew very little of the raw material of many of the fabrics from other parts of the world. We were for a long time ignorant of the materials from which Manilla handkerchiefs were made. It was said to be the fibre of the leaf of the pine-apple, but we had not succeeded in manufacturing them in this country. Dr Lankester remarked, that although the exhibition of raw materials in the coming Exhibition of 1851 had been deprecated by some, he believed that it might be made one of the most important and valuable features. Dr Royle said that it had long been doubtful what plant yielded the grass-cloth of India, and now that we knew the plant, it would undoubtedly lead to its further employment. There were many other fabrics in India of which we knew nothing of the materials. He thought that one of the most important branches for the manufactures of this country of the Exhibition of 1851 was that of raw materials. Every pains should be taken to obtain the name and history of every species of plant which yielded any substance useful in the arts, manufactures, or medicine.

SONG—MY BORDER HOME.

AIR—*The Rose of Allendale.*

SOME praise the charms of foreign climes,
Where summer skies ne'er fade,
Where beauty dwells in shoe-black eyes,
And cheeks of olive shade.
So let them boast who choose to roam
O'er lands beyond the sea;
Content am I—my Border Home,
And Tweedside charms for me.

Sing not to me of orange groves,
Of birds with dazzling plume;
Of vine-clad hills and perfumed vales,
Where fragrant myrtles bloom;
Of gay guitar's soft, magic tones,
Of love-born minstrelsy:
They tempt me not—my Border Home,
And Tweedside charms for me.

Oh, nought beneath a southern sky,
However rich and rare,
With thy enchantments, bonny Tweed,
For beauty can compare.
Here let me dwell—'tis nature's throne—
Among the brave and free:
Content am I—my Border Home,
And Tweedside charms for me.

O. (81st Regt.)

Berwick-on-Tweed.

COMPLEMENTARY COLOURS.

It is well known that the combination of two complementary colours produces white; and this is usually shewn in lectures by employing two glasses—one of a red, and the other of a green colour, the tints of which, although of considerable intensity, entirely disappear during the simultaneous interposition of the glasses between the eye and the source of light. M. Maumené several years since arrived at the same result by using coloured liquors, and especially by mixing a solution of cobalt with one of nickel, both perfectly pure, and so diffused that their colour is nearly of equal intensity. The roared colour of the cobalt is completely destroyed by the green of the nickel, even in concentrated solutions, and the mixed liquid remains colourless.—*Journ. de Pharm. et de Chim.*, Mars 1850: *Philos. Mag.*, No. 244.

Owing to a singular mistake, the poem entitled *Defiance to Time*, which appeared in No. 381, was ascribed to a veteran soldier living in Northumberland. We now learn that it is one of the published compositions of Dr Charles Mackay. It is but justice to the veteran in question to mention, that he had no culpable concern in the matter.

THE EMIGRANT'S MANUAL.

W. & R. CHAMBERS are now publishing a *Work for Emigrants*, carefully prepared from the most recent public documents, and other trustworthy sources of information. It will embrace accounts of the following fields of Emigration, and matters of general utility:—

AUSTRALIA;
NEW ZEALAND; SOUTH AFRICA, including the CAPE OF GOOD HOPE, and PORT NATAL.
BRITISH AMERICA; and UNITED STATES OF AMERICA; also,
A GENERAL DISSERTATION, containing Miscellaneous Information, and Advice to Intending Emigrants.

These will be published separately, at One Shilling each; and when all are issued, they will form a comprehensive work in one volume.—Sold by all Booksellers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. N. CHAMBERS, 20 Argyle Street, Glasgow; W. S. ORR, Amen Corner, London; and J. M'GLASHAN, 20 Upper Sackville Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 386. NEW SERIES.

SATURDAY, MAY 24, 1851.

PRICE 1½d.

THE GUILD OF LITERATURE AND ART.

At the dawn, and during the morning twilight of modern literature, there was no employment more sure of carrying genius to wealth and distinction than authorship. Kings and princes were then the patrons of the muses, and in honouring men of letters, they felt that they rendered themselves illustrious. But these were not stipendiary days. We find the cowherd-poet Cædmon, indeed, received into the monastery of Whitby as a kind of honoured pensioner; but in general, men who distinguished themselves in literature were promoted to high offices in the church—as in the case of Grosteste, the beggar-boy, whom learning eventually placed in the see of Lincoln. As knowledge extended, the patrons became more numerous, and competition among men of letters greater; till the sacred name of poet was degraded into a mere trapping of nobility, and the Lord Chancellor of England (Longchamp, bishop of Ely) purchased praises of the unfeeling brethren, and caused them to be sung in the streets.

Many noble works, however, were produced even in this long era of degradation, which may be said to have continued till the early part of the last century; when, in consequence of the gradual widening of the circle of readers, authors had become too numerous, and some too independent, to be bribed. It was only at this time literature became a profession; for although before then a few desperate individuals may have clung to it as their sole resource, in general it was either a medium by which men of genius who lived by other pursuits made themselves heard and felt in the world, or a means by which the more dependent hoped to recommend themselves to persons of power and influence. The transition period between patrons and the public was a terrible time for authors! Those were the days of bibliopolitic tyranny, of rags, bailiffs, garrets, and bulkheads; but in spite of all, literature gave token that the change through which it was passing, though severe, was wholesome, and in due time an independent though still peculiar Profession arose out of the chaos.

That profession, however, is not so crowded as is commonly supposed; for there are many prudent persons who use authorship not as a crutch to lean upon, but as a staff to help. The professional authors are comparatively a small body, but they are an essential part of the constitution of the age. There are pursuits in literature which demand the whole time, and the whole soul; and there are even its more mechanical functions—such as editing—which are incompatible with the performance of other duties in the business

of life. In reading a voluminous catalogue of books of the day, we must not suppose that any great portion of these are the works of authors by profession. They are in by far the greater part the productions of persons who are either independent in fortune, or who gain their living by other pursuits; and to such categories belong almost all the anonymous works.

The professors of literature, notwithstanding, are numerous enough to form a distinct body; and their occupation is perhaps the most precarious in the whole range of industry. A barrister, a physician, a clergyman, may be able to calculate his chances of success, the influence of his friends, and his own private resources; but the author has no data whatever. The most brilliant success one year is no guarantee for the next; and not unfrequently the reward of his performances is in an inverse ratio to their real value. Yet professional authorship is as essential a component part of our existing civilisation as professional law, physic, or divinity. It has grown out of the intellectual necessities of the age; and the status of the author serves as a fair criterion for judging of the refinement of society.

It is a generally-received opinion, but we think an erroneous one, that authors are more imprudent than the other classes of the community. This was the case in the transition period we have mentioned, when authorship, however emblemed by one or two individuals, was but another name for vagabondage; but in the present day literary men pretty nearly resemble other people in the common affairs of life. Their misfortune is, considering their profession in an economic light, that the article in which they deal is in itself invisible and intangible, and can have therefore no intrinsic pecuniary value. It cannot be sold to a lower class of the people if disdained by a higher. It has no 'tremendous sacrifices' wherewith to tempt the parsimony of purchasers. It cannot, even in case of failure, be disposed of as materials. Everything with authors depends upon the passing taste of the day—everything but fame, which gives a stone to the memory of the genius which, when living, wanted bread.

There is one great institution in this country for the relief of authors in their casualties—the Literary Fund; but, as its name implies, its operation is not confined to professional authors, but embraces all contributors to literature. It assists the widows and orphans of literary men, and its donations to these men themselves, we are proud to mention, are not unfrequently considered as loans, and returned in better times. If the proceedings of this institution are conducted with the inviolable secrecy it professes, it must do infinite good; otherwise it could only serve to degrade an honourable pursuit. But whether it be owing to the dread of exposure, or to

the comparative prosperity of the class, the fact, we believe, is certain, that very few names even of moderate distinction in literature are to be found in its list of claimants. Besides the Literary Fund, we may add that the Queen has a fund at her disposal for pensioning contributors to literature. The amount, however, is very limited, and the scramble for what is as much an honour as a benevolence, is probably great enough to render Her Majesty weary of the trust.

There is now, however, on foot a proposal for instituting a fund for the benefit of professional authors alone, which merits the examination both of the literary world and of the enlightened public; containing, as we think it does, at least the germ of a great idea. The name fixed upon for the society is the Guild of Literature and Art—meaning, doubtless, a fraternity similar to that of the trades, in which all the members pulled amicably together. The word guild, however, we may say in passing, implies money, of which the brethren were the disbursers, not the recipients. The earliest certain notice of such a company in England refers to the payment into the Exchequer of sixteen pounds of silver by the Guild of Weavers, in the reign of Henry I. The name, notwithstanding, may pass very well, as expressing a fraternity or corporation of individuals, having the same interest, following the same pursuit, and animated by the same object. The main object of this new Guild is to 'enforce the duties of prudence and foresight especially incumbent on those whose income is wholly or mainly derived from the precarious profit of a profession; and this it proposes to do by extending the benefits of the fund only to individuals who effect insurances in a certain life-office therewith connected. We humbly think there is here room for a slight change of plan. Many authors—perhaps nearly all authors of any eminence—are already insured to the extent of their ability. All such persons would be excluded by the rule we have mentioned from the new society, which would thus be open only to the selfish or improvident of the literary body. As for the exclusion of those who have been, and are, unable to effect any insurance at all, this, however lamentable, cannot be imputed as an error to a society which assumes to interest itself only in authors of a certain note, leaving the others, as at present, to the Literary Fund.

The pensions are to be given in the form of salaries, with or without free residences, 'completed with due regard to the ordinary habits and necessary comforts of gentlemen.' The endowed officers will consist—1st, Of a Warden, with a house and a salary of £200 a year; 2d, Of Members, with a house and £170, or, without a house, £200 a year; 3d, Of Associates, with a salary of £100 a year.

The design of the institution, we are told, is 'to select for the appointment of members (who will be elected for life) those writers and artists of established reputation, and generally of mature years (or, if young, in failing health), to whom the income attached to the appointment may be an object of honourable desire; while the office of associate is intended partly for those whose toils or merits are less known to the general public than their professional brethren, and partly for those, in earlier life, who give promise of future eminence, and to whom a temporary income of £100 a year may be of essential and permanent service.' The duties for which these emoluments are to be given consist chiefly in the delivery of lectures—three in the year by members, and one in the year by the warden; but even these may be delivered by proxy, since although 'it is deemed desirable to annex to the receipt of a salary the performance of a duty, it is not intended that such duty should make so great a demand upon the time and labour either of member or associate as to deprive the public of their services in those departments in which they have gained distinction, or to divert their own

efforts for independence from their accustomed professional pursuits.' This, we think, is another ill-considered part of the prospectus, and one which implies anything but a compliment to the literary body. If services are really to be rendered for the salaries, let there be a proper balance between them; but surely there should be no such thin make-believe as this. Authors are entitled to take higher ground. Their profession is necessary to the civilisation of the age—more necessary than that of naval or military officers; and if the country see fit to make up for its precariousness by contributing to the support of its veterans, they will accept the aid as proudly as ever warrior received a trophy. The time, however, we trust, will come when the profession, having passed its infancy, will be able to stand alone; and when authors, with clearer perceptions of their own position, and a better knowledge of the means of aiding themselves, will require no aid from others. As for the proposed lectures, they are objectionable on other grounds. The present lecturers are authors themselves, and why should these be displaced by pensioned authors? Why remove from the reach of ordinary literary men one of the few resources they possess?

The grand distinctive feature of the projected society is the limitation of its benefits to the professors of literature and art. 'Within the former term are understood to be comprehended all writers, of either sex, of original works or dramas, or of not less than twenty original papers in periodicals. Within the latter, all painters and sculptors who make the fine arts their profession, and all students of the Royal Academy of England, Scotland, or Ireland.' The literary criterion here is not distinctly enough expressed. It is obvious, from the context of the prospectus, that only those persons are meant who follow literature as their sole business in life; but there is hardly a young lady of our acquaintance who has not contributed a score of original articles to a periodical. The real object of the society should be more clearly defined. The most voluminous contributors to periodicals are not professional authors; and to admit such persons indiscriminately to the benefits of the society, would be to divert the fund to the aid of almost every profession that can be named.

The fund is to be commenced by the profits on the performance of a comedy, written by Sir Edward Bulwer Lytton, and acted by Messrs Dickens, Jerrold, Forster, &c. on a stage furnished in his house by the Duke of Devonshire. The audience is to consist of the Queen and Prince Albert, and all persons who choose to pay £5 for a ticket. This announcement has provoked some ridicule; but we hope the scoffers will carry their smiles to the comedy. It may be very true, as it is said, that the performance of amateur actors cannot be expected to equal in merit that of a second-rate provincial troop; but the question is not as to the merit of the performance, but the amount of money it produces. It may be an odd taste which induces good authors to exhibit themselves to the public as indifferent actors; but if the public pay handsomely for the sight—which they unquestionably do—the authors are entitled to our thanks for laying out their eccentric earnings in so noble a manner. The fund must commence somewhere, and why not at a comedy in Devonshire House?

The scheme, however, though commencing with a comedy and a company of amateur actors, must be carried out by the nation; and knowing this, we think the projectors committed an error of judgment in sending forth their prospectus before endeavouring to associate with themselves the higher members of the profession throughout the country, and the more distinguished patrons of literature and art. We have ourselves mentioned more than one important objection to the plan as laid down; and there are many others, we doubt not, who would be glad to offer their opinions on so interesting a subject. As for the laudatory letters and professions of adhe-

rente they may have received, these are all very agreeable of course; but a great national institution like the one proposed cannot be founded safely without the aid of a great diversity of minds, or without hard thinking and searching discussion.

Upon the whole, instead of expending the profits of the dramatic representations in the establishment of the institute in the form proposed, we would counsel the projectors—while warmly extending to them the hand of fellowship—to deposit the money in their banker's hands for the present, and take the opinion of the literary mind of the country upon the merits of their plan.

LAW AND JUSTICE IN CONSTANTINOPLE.

Nor long ago, during one of the weary days of Rhamadan, Mohammed Dibilay was sitting cross-legged upon his empty counter, smoking his pipe and chanting some verses of the Koran, when his prowling eye caught sight of a Jew who was sauntering about the bazaar. The Mussulman called him, and asked if he did not know any stranger, with plenty of money and little sense, from whom they might manage to extract a little, to recruit his exhausted finances. This question struck a chord of the Jew's heart, which vibrated with joy; for his business was also at low-water mark. A merchant had recently arrived in the city, little acquainted with the manners of Constantinople, and the confederates devised a plan to cheat him of some goods, agreeing to divide the spoil. The Jew forthwith repaired to the house of the Frank, and informed him that he had found a very desirable customer for his merchandise, and one whom he must by no means let slip; for, said he, 'he has been opening a new shop, which he is stocking with different kinds of goods, and I know that I could not recommend him to a better person than your honour.'

'That is well,' said the merchant; 'but mark me, Jew; I have heard that you brokers often play tricks upon strangers. Now, I hate cheating, and it never succeeds with me. All my business transactions are ordered in an honourable manner; and depend upon it, if you deceive me, you will suffer for it. With this understanding, you may bring hither the gentleman of whom you speak, for I can judge his honesty better by his physiognomy than by the appearance of his shop.' Jacob swore by his head that all was right, and that the merchant would be convinced of his sincerity when the business was finished.

He returned to Mohammed, who had by this time procured a thousand piastres (the piastre is worth about 1/4d. sterling), according to their former arrangement; and having divided this sum between them, they proceeded to the Frank quarter of the city. The Jew introduced his friend to the merchant, as the grocer whom he had mentioned—a man of upright dealings, a perfect gentleman; averring, that as soon as he had heard the name of George—far famed as it was for integrity and wealth—he had brought a considerable sum of money to make an immediate purchase. Mr George closely inspected the features of the stranger, and expressed his satisfaction with his honest appearance; but added, that as it was the first time that he had the honour of his acquaintance, he should expect the broker to be responsible for anything which he might intrust to the grocer's credit. Jacob then requested Mohammed to choose out goods to the value of thirty or forty piastres (each containing 500 piastres.) Dibilay said, that he only intended to buy to the amount of money which they had with them; at the same time lamenting that he had not brought a larger sum: 'for all my cash was in heavy coin, which it would have been too troublesome to carry; and if I had intrusted it to a messenger, there would have been great danger of losing it, as it could not have failed to attract attention; and

in this wicked town, as soon as a man is known to be rich, he cannot eat his bread in quiet. Nobody can imagine how vile a place this Constantinople is! We must confess it with shame, though it be our own city.' The merchant now joined with the broker in persuading Dibilay to take some goods upon credit; and with seeming reluctance he made a bargain to the amount of thirty-five piastres, two of which were paid on the spot. The merchandise was removed, and part of it soon turned into money, to meet any exigency that might occur; for in Constantinople 'money answereth to all things.' Mohammed then calmly awaited the issues of fate, and took no more notice of his former correspondents.

But Jacob Aaron was anxious to terminate the affair, that he might get rid of his own responsibility, and obtain his share of the spoil. So, after a short time, he went to the house of the European, assuming every appearance of deep distress. Having uttered many sighs and groans, he found words to exclaim that he was a ruined man, and that all his property would be lost. The merchant expressed lively sympathy with his sad condition, and kindly inquired into the reason of his sorrow. Was his house burned down? Were his children lost? 'Ah sir,' responded the mourner, 'would that my house had been burned to the ground, and that I had perished with my children, before so sad a day had dawned! Wretch that I am, would that my legs had been broken before I went to such a place! But let my miserable fate be a warning to my brethren, to renounce for ever the trade of a broker! Besides, this business ill befits my station in life, considering the extensive warehouses of my father, the great glass-merchant. The truth is, that the man whom I brought to you the other day is reported to be a thief and a knave. He had every semblance of being an honest fellow, and I never found him otherwise; but he has been corrupted by this vile Constantinople. Oh what a depraved city we live in! An honest tradesman has no chance in such a place! But, sir, if the report be true, I think you might recover your goods out of his possession.'

Mr George was so affected with the Jew's apparent distress, and so roused with indignation at Mohammed's supposed treachery, that he easily fell into the trap which was laid for him; and bidding Jacob calm himself, offered instantly to send a janissary for the traitor. But the Jew threw himself at his feet, and begged, as one only favour, that he would not mention his name as the informant, lest the Mohammedan should either assassinate him, or get him put to death under false pretences. The merchant promised to keep his secret, and said that he would take the matter into his own hands.

Jacob retired with inward satisfaction, finding himself thus freed from farther responsibility; for he did not altogether trust Mohammed, nor any one else that bore the name or the badge of the false prophet. He wished to expedite the crisis. So he hastened to the house of Dibilay, and told him that the merchant had heard some flying rumours about his character; and that, although he had given every assurance of his integrity, yet he must prepare himself for an official visit, and subsequent lawsuit. He then begged that his own name might not be mentioned at court, lest it should damage him in the estimation of the Europeans, on whom he chiefly depended for a livelihood.

Next day Mr George came to the bazaar, accompanied by a janissary, and mildly asked the grocer for payment of his account, as he had need of the money. Dibilay assumed an air of severity, and bid him begone. 'Find your clothes where you took them off, and demand money of him to whom you consigned your goods.' Indignant at this base repulse, the Frank at once went to the mehkemy, and requested the sergeant of aghas to send a bailiff for Mohammed. Hussein Agha was

deputed on this business; and going to the grocer's, asked him to be at the trouble of attending at the mehkeny, where a process was being instituted against him. Dibilay stormed at the parties who thus dared to affront him; and having whispered something in the officer's ear, promised to follow him to the court. Hussein informed the sergeant of his coming, adding in a low voice, that Mohammed wished him to know that he was falsely accused, and if he would be kind enough to inform the cadi of this fact, he would be liberal in defraying the expenses of justice. At this instant Mohammed made his appearance, and saluted the sergeant.

'Your servant, sir: how is your precious health? I sincerely trust that you are well, and your affairs prosperous.'

'Good-morrow,' replied the agha; 'I wish you well. Is it against you, friend, that this proceeding is commenced? Come with me to the effendi, and I shall lay the whole matter before him; and Heaven defend the right!'

The agha then led the way to the house of the cadi; and upon the defendant being called for, he introduced him in flattering terms. 'Here he is, my lord; it is our countryman, Mohammed Dibilay the grocer.' The judge replied, that it did not signify who he was, and commanded the parties to stand before him side by side. The plaintiff was then ordered to state his claims, which he did in a plain, unvarnished manner. The cadi next called Mohammed for his defence. He replied: 'My lord, you are the minister of justice, and falsehood would avail little in your presence. One might as well attempt to cover the sun with mud as to deceive you. The merchant says that I received goods from him to the value of thirty-five purses. This is true, my lord; but he did not allow me to set one foot before another until he had obtained the whole amount. Yes, if my right be not acknowledged in this court, I will carry my cause before the sultan's council; and if there also justice be not rendered me, I appeal from the presence of man to the tribunal of the Great Supreme.'

'I understand,' said the judge; 'but can you now prove by witnesses that you paid the money?'

'I have witnesses, my lord; but how can I produce them at a moment's notice? Order the merchant to swear that he has not received the full amount. But if he be willing to take such an oath, I shall not easily be prevailed upon to lose so large a sum of money; but shall extricate myself from this difficulty in another way.'

The cadi informed Mr George that the law obliged him to make oath if the defendant wished it, and asked him if he were willing to do so. As some Christians decline taking a Mohammedan oath, Mohammed hoped that his accuser might be of this number, and that the matter might be thus summarily terminated. But in this he was disappointed. The merchant, indeed, at first hesitated; but finding that if he did not comply he must lose the whole money, without any hope of appeal, he signified his willingness to comply. Mohammed then shifted about, and requested the judge to dispense with the oath, assuring him that he had such clear evidence of having paid the money, that he preferred being at the trouble of producing it in court. The obsequious cadi assented, and ordered all parties to appear again in three days. Security was taken that the defendant did not abscond.

Dibilay was scarcely seated in his shop, and had just begun to regale himself with his pipe, when the Jew suddenly appeared, and with a smiling manner, whispered—'How well you have managed matters! Take care and don't play me a trick, for half the money is clearly mine. I had my creatures posted at all the avenues of the court, to instruct me in what was passing. Now, we must look out for witnesses.'

Adjoining the mehkeny of Mahmoud Pasha there

is a certain coffeeroom, frequented by persons of loose character, who live by their wits instead of honest labour. Here witnesses can always be procured—men who are ready to swear to anything. As Turkish law requires the testimony of two disinterested parties, two of these men concoct a story between themselves, and are ready, for a trifling bribe, to swear to all its particulars. Having very fertile imaginations, and being accustomed to the business, they easily invent a number of particulars which have the semblance of truth itself. It is true that in such a cross-questioning as takes place in British courts of law, their evidence would soon break down, and a clever lawyer would easily get them convicted of perjury. However, these knaves in Constantinople know with whom they have to deal. Their opponent is a simple man, else they browbeat him, and throw him off his guard; and they are previously assured that the judge is on their side. It is only by a manoeuvre in changing the court, and giving a retaining fee to another judge, that there is any hope of success.

Not far from the coffeehouse to which we have alluded, there used to be a fruiterer's shop, with a convenient back-parlour for parties wishing to take refreshment at their leisure. This man was in league with the visitors at the coffeeroom, and he for a long time kept up a thriving trade. But upon an unfortunate occasion, when they were playing tricks upon a hapless Greek, the latter bribed the grand vizier with the present of a handsome girl to do him justice; upon which a regular smash of the confederates took place; the perjurers were sent to the galleys, the master of the coffeehouse was bastinadoed, and the fruiterer deemed it prudent to change his place of residence, having spread the report that he had died of plague. When the storm passed over, another occupant was found in the shop, pursuing a twofold business as before—selling conscience and merchandise at the same time.

Into this back-parlour the confederate Mohammedan and Jew now entered; and upon their ordering certain provisions for a dinner at sunset, which was not far off, the fruiterer understood their meaning, and hastened to the coffeeroom.

'Come to my house,' whispered he to the landlord, 'about a little affair, out of which, I guess, we shall reap some profit.'

The landlord immediately exclaimed: 'My dear sir, the negro of whom you speak—I used to see him every day in this square with his plate. He has not been here for some days, but if I can hear any news about him, I shall bring you word.'

This remark attracted the notice of some bystanders, who immediately made inquiries about what the negro had done.

'He has played a trick upon the unfortunate fruiterer, having stolen honey, butter, and sweetmeats out of his shop, and the fruiterer is now after him.'

One of the persons present observed that he had just seen a negro in the Place of Sultan Bajazet's mosque; and the landlord intimated that he must give his friend this piece of important information. As he was going out of the house two gentlemen followed, saying: 'Landlord, whatever may be the business afloat, you know well! Our brethren are all engaged abroad, but we have had nothing to do for a week.'

When he reached the fruiterer's, he was soon made acquainted with the business on hand, and immediately sent for the two gentlemen just alluded to, under pretence of their giving information about the negro. On their arrival, Mohammed ordered pipes and coffee, and then unfolded his case.

'Gentlemen, listen to me, for I shall hide nothing from you. I bought of a Frank merchant goods to the amount of thirty-five purses. But how could I divine? I thought him to be an honourable man like myself; but now he demands of me thirty-three purses.

Be pleased to devise some method of extricating me from this dilemma.'

After some moments of thought, accompanied by large fumes of smoke, one of them gravely replied: 'That which is passed, is passed; and that which is done, is done. Let us look at the future. When you paid the money, had you any witnesses of the transaction?'

'None,' said Jacob. 'No man was present but Dibilay and myself. He paid the merchant in current gold. I witnessed the fact: but my interest is opposed to my giving evidence in this case, for I am under the protection of the Franks, and it would be difficult for me to open my mouth. Try, therefore, to find out a plan for arranging the matter without mentioning my name. This will be a meritorious act on your part.'

One of the gentlemen then addressed his companion, 'What say you, brother? If any one, ignorant of the whole truth, were to see us meddling in this concern, he would say: "Look at those gentlemen in violet trousers, with large coats and painted eyebrows! They are going to give false testimony." And yet, thank Heaven, we are far from meriting such evil surmises: we only wish to deliver the innocent out of the pit of the wicked into which they have fallen! What is your advice?'

The other replied: 'Brother, thy reflection is just. May Heaven protect the good in his proper rights! Jew, you are a true man: so is Dibilay. Nevertheless, the path which we must pursue is a crooked one. So you must give five hundred piastres to myself, and the same to my comrade; one hundred piastres to the landlord, and as much to the fruiterer. Moreover, the *kiahkya* of the *Caziashur* of Roumelie is our friend, and we should make him a present, that the *caziashur* in person may judge the process. This is the best mode of procedure. Give me now ten piastres, that I may get a *chouash* to write a request to the *caziashur*, that he will himself take cognizance of this affair in presence of the grand vizier.'

Mohammed tried in vain to reduce the demand of the gentleman. He pleaded poverty; asked for their sympathy; and promised them the favour of Heaven, if they would engage for a smaller amount. They told him, that however inconvenient it might be for him to give them this little remuneration, it would be much more so to pay the Frank thirty-three purses: and that he had evidently mistaken their character and profession. 'Let one of your eyes weep, that the other may laugh: we must have four purses to cover all expenses.' Dibilay was obliged to submit. The landlord then sent for the *chouash*, Osman Agha, to procure a form of appeal to the Supreme Court. The gentlemen also paid a visit to the *kiahkya* of the *caziashur*, when the following conversation ensued:—

Salaam, Ali Effendi! I have come about an affair out of which we may gain both merit and money.

Kiahkya, Salaam Aleikum, who have grown old in hearing false witness. You rogue! I believe you when you say there is one God: but after that, I do not give credit to one word which falls from your mouth.

Gentlemen, My lord, when have I told you a lie?

A. If you were in the habit of speaking truth, you would not pursue the trade of a false witness. But let us cease this badinage. Will the case bring us a little money?

Genl. I have seen a grocer who bought some spices from a Frank; but the merchant, after receiving payment, demands it a second time. Dibilay has no witnesses. What could he do, poor fellow? He has had recourse to us—and you may divine the rest.

A. What offer does he make? If he will give half a purse for me, and a purse to the effendi, besides the expenses of court, you may carry your suit before the effendi, in whose eyes I will make your testimony agree as clearly as if it were truth.

Genl. My lord, if we give a purse and a half, cannot the thing be arranged? For according to your demands, we shall have little for ourselves. But I am your slave. K. Oh hypocrite! I will abate nothing. Go, bring your cause before this tribunal, and all will go well.

Next morning, a dragoman was despatched to bring Mr George to court; for the confederates had agreed to take him by surprise, lest he should find means to frustrate their schemes by bribing some witnesses on his part to tell the truth. The *caziashur* sat by the side of the grand vizier; the other parties stood before him. The vizier knew little about law or justice, as he had recently been elevated to his high station, according to the Turkish notions, that 'a man who is good at one business will be good at another,' and that 'Allah, who gives the rank, will give ability to occupy it aright.' Upon hearing the nature of the cause now before him, he wished at once to put all the parties under arrest till a competent person should inquire into their characters and circumstances; but asked the *caziashur* what he would advise to be done. He replied: 'My lord, your opinion is well founded, and is such as becomes your august dignity. Yet, according to the usual forms of judicature, we should first take the depositions of the witnesses, and afterwards endeavour to verify their testimony. Their evidence may be true, so that you must beware of unpleasant consequences. But if you approve my advice, and will charge me with the management of the business, I will appoint some mediator to bring the parties to an amicable settlement.'

The vizier readily assented to this proposition, which would save him from farther trouble, and would be attended with no odium from his European acquaintances. The *chouash* and dragoman were instructed to procure a settlement of the case. The contending parties easily perceived that they must submit to this authority; for whoever should refuse to comply would inevitably lose his suit. The dragoman argued the matter with the Frank, and the *chouash* with the Mohammedan, and after much altercation, each succeeded in persuading his client to abate fifteen purses. There still remained a difference of three purses and the law expenses, for which the *chouash* said 'Heaven would provide, and they might regard the matter as settled.'

'Singular idea!' rejoined the dragoman; 'when the ragout is cooked and ready for eating, would you put it again into cold water? Doubtless he who pays so large a sum is ready with a trifling balance, and must bear the expenses.'

After some further bantering, Mohammed at last yielded to his advisers, saying in a dejected tone: 'All of this money will be a dead loss to me; and you know that one cannot take two skins off one sheep. But my credit and character are at stake. What can I do? Well, I suppose a stroke of fate has fallen upon my fortune rather than upon my head, and I must resign myself to the fatality. This day you have trampled me under foot, and I am become stupified. Do as you please; but may Heaven preserve the faithful from the hands of the law!'

The parties were ordered to appear in court on the following day, mutually to discharge each other from any further claims. Dibilay came late; then putting a bag of gold into the hands of the dragoman, he said, with a solemn but decisive tone: 'Here is all the money that I can muster. Here are the fifteen purses which I offered to give. Of the three purses which made the difference between us, I have brought eight hundred piastres, and two hundred for the expenses of court. I can do no more.'

Mr George was easily prevailed upon to accept the amount now tendered; and the parties, having declared themselves satisfied, retired.

Dibilay repaired to the fruiterer's, and settled his account for the bribes of justice; and returned home,

satisfied with the gain of his fraud, which amounted to twelve purses. But the Jew expected to divide the spoil; and immediately appeared with a smiling countenance, congratulating his friend on the issue of the lawsuit, and intimating his readiness to receive a little cash on account of his share. The wily Mohammedan, however, appeared not to recognise him; and said in a loud, gruff voice, 'What do you want, Jew? Have you lost your wits? For some minutes you have been babbling nonsense before my shop, as if you were a madman. If you are a fool, I have a stick ready for you; if you are a mendicant, may Heaven help you! if you are a brazen-face, I have yet more brass than yourself. But I see what is the matter: you have not to-day been able to allure any one into sin! Infidel, may Heaven destroy thy house and religion! Begone, or I will break your head!'

The heart of Jacob Aaron sunk within him. He loitered for a moment; but perceiving Mohammed's neighbours gathering around, each venting curses against the seed and creed of Israel, he retired with all convenient speed, muttering imprecations upon the house of Islam; but at last cursing his own folly for giving credit to the word of a Mussulman, and concluding with this instructive apostrophe, 'By my beard, the proverb truly says, the best cunning is to have none!' As he passed through the gate which bounds the Turkish quarter of the city, he unobservedly shook off the dust from his sandals, and was not again connected with a Mohammedan trick. Mr George, who, like most Englishmen, was formerly a grumbler at the costliness and uncertainty of English law, has since become silent on that subject.

MILD WINTERS.

To say that everybody talks about the weather, is to state a fact with which everybody is already acquainted: fair or foul, it seems of necessity to be the initial topic of ordinary conversation. No one objects to say a good word in favour of a fine day, because, as Shenstone observes, 'people can commend it without envy.' Most persons must have remarked that weather-talk is in general mere guess-talk. Yet meteorological science is somewhat advanced towards the point of certainty; the doctrine of cause and effect is more clearly appreciable than formerly; and the unseen influences which modify climate are found referable to constant or periodical laws, whose action is not less interesting than beneficial.

It is pretty well known that geographers divide the space from the equator to the pole into twenty-four climates, the differences varying from half an hour in the torrid and temperate zones up to a month in the polar regions. Assuming lines of demarcation for all these divisions, they are seen to fluctuate and present many anomalous departures from uniformity. Situation has much to do with this derangement: continents, as is well known, are hotter and colder than islands. At the equator, where a perpetual summer temperature prevails, there are but two seasons—wet and dry; while in England we have four distinct and marked seasons, but liable to all sorts of irregularities and disturbances, in which, however, the polar character prevails over the tropical—a consequence of our geographical position on the globe. Dove of Berlin, who has so ably elucidated many of the phenomena of climate in his maps of isothermal lines, observes: 'In all the stations or places of observation of the torrid and temperate zones, the elasticity of the vapour of water contained in the atmosphere increases with the elevation of temperature. This increase, from the cold to the warm months, is greatest in the region of the monsoons, particularly towards the northern limits; and in North America a little more sensible than in Europe: that the pressure of dry air diminishes at all the stations with a slight

exception on the north-west of America (and perhaps in Iceland), from the cold to the hot months: the minimum for the temperate zone falls in the hottest months, and consequently in July in the boreal hemisphere, and in January or February in the austral hemisphere: the maximum of this oscillation is at the northern limit of the northern monsoon, and much more marked in the southern than in the northern hemisphere: that from the simultaneous action of these two changes immediately results the periodical changes of atmospheric pressure, which, by the relative diversity between the one and the other, present themselves differently in different countries.' In these statements we have, as it were, a key to some of the laws affecting the moisture or the dryness of climate.

Moscow, with an arctic winter, and so near as it is to the pole, has a summer heat equal to that of Spain, while in England the climate partakes of neither extreme. The milder temperatures of islands is caused by the fact, that the surface-water of the surrounding ocean sinks as soon as its temperature falls below forty degrees, and is replaced by warmer water from beneath. In the coldest month of the year London is colder than Edinburgh or the Orkneys, but the mean heat of the London summer is greater than at the other two places—an amount of fluctuation which is essentially beneficial; for an occasional rise to eighty or ninety degrees is far more favourable to vegetation than a constant mild temperature, which, though it would make fruit, never produces ripeness.

If, however, the presence of a circumjacent sea preserves us here in England from great extremes of heat and cold, it exposes us in another way to what appears an undue amount of moisture, varying in different localities. The average number of rainy days in the year on the eastern side of the island is 135, while on the western side it is 205. The annual rain-fall at Keswick, omitting decimals, is 62 inches; at Lincoln, 24 inches; at Liverpool, 34 inches; at Aberdeen and London, 20 inches; at Manchester, 36 inches; at Edinburgh, 23 inches. Winter has most rainy days, but summer the most rain. The yearly average is, however, exposed to disturbing causes, by which it may be greatly modified—the prevalence of particular winds, or the character of the country. Considerable effect is produced by the presence or absence of trees. Large plains are remarkable for their dryness and frequent barrenness. Humboldt says: 'By felling the trees that cover the tops and sides of the mountains, men in every climate prepare at once two calamities for future generations—the want of fuel, and a scarcity of water. Trees, by the nature of their perspiration, and the radiation from their leaves in a sky without clouds, surround themselves with an atmosphere constantly cold and misty. They affect the copiousness of springs—not, as was long believed, by a peculiar attraction for the vapours diffused through the air, but because, by sheltering the soil from the direct action of the sun, they diminish the evaporation of the water produced by rain. When the forests are destroyed, as they are everywhere in America by the European planters, with an imprudent precipitation, the springs are entirely dried up, or become less abundant.' Whether the cutting down of the trees—as has often been proposed—which now grow so pleasantly and numerously on the hedgerows over most parts of England, would produce any alteration for the better or worse in our climate, is a matter to be settled only by analogy or experience. As far as observation extends, the cutting down of trees tends to produce aridity; at the same time it has been remarked, that the winters in Canada and the adjacent states are less severe in proportion as the land is cleared. In Pinang, the inhabitants have memorialised government against the destruction of their forests, sure that the result by its continuance will be the ruin of the climate.' In the deep valley of Aragua,

in South America, is a lake which has no outlet, and lying closely surrounded by woods. 'Between 1555, when it was described by Oviedo, and 1800, when it was visited by Humboldt, the lake had sunk five or six feet, and had receded several miles from its former shores—the portion of the basin thus left dry appearing the most fertile land in the neighbourhood.' Here was the effect of the cutting down of trees; but 'when the war of liberation broke out, agriculture was neglected, and the wood from the hills was no longer required by human industry—a great jungle began to prevail over all. The result was, that within twenty years not only had the lake ceased to subside, but begun once more to rise and threaten the country with general inundation.' At Marmoto also, a town situated deep in the vast forests of Popayan, an analogous effect occurred. Water-power is used to work the machinery of the neighbouring mines, and the supply of water 'was observed to decrease steadily as the wood was cut down. Within the space of two years from the commencement of the clearing, the decrease of the flow of the water had occasioned alarm. The clearing was now suspended, and the diminution ceased. A rain-gauge was established, when it appeared that the fall of rain had not diminished concomitantly with the flow of the streams. The clearings were too local to affect the general condition of the climate; the rain which fell, however, instead of percolating, as was its wont, through the soil, when shaded by trees, producing springs, rivulets, and brooks, now dried up, and was carried off in vapour as it fell.' Similar instances have been noticed in other parts of South America, and in India and Switzerland. In the island of Ascension, a spring at the foot of a wooded mountain dried up as the trees were cut, but flowed again as the wood was permitted to renew itself. And in St Helena, steady falls of rain have been produced by the growing up of woods which have from time to time been planted under direction of the authorities, and for nine years the periodical floods which formerly caused great mischief have altogether ceased.

Besides these more direct results, the temperature of a country is, as observed with regard to Canada, affected by the greater or lesser wooded area of its surface. A change is produced in the soil as well as in the atmosphere; for it is a fact well known to agriculturists, that land cleared and drained is warmed by the rains which percolate from the surface to the drains beneath. It must be remembered that we have a combined or double atmosphere—water and air; the former always resolving itself into vapour of extreme levity under favourable temperatures. The more air is condensed the higher becomes its temperature; a given quantity of air at 55 degrees, if compressed into half its bulk, would have doubled its heat to 110 degrees—a fact which has a material bearing on the subject of the present article. It has been shown that a rise takes place in the isothermal lines of the northern hemisphere in winter—a result which Dove refers to the action of the sun causing evaporation of the waters of the southern tropic, which then pass over to the north. But to this it was replied, at the last meeting of the British Association, that 'the West Indies constitute the principal point of departure of this vapour, and in the month of January it is carried by south-west and west winds to those localities where the isothermal lines advance farthest towards the pole. It is, accordingly, to the condensation of this vapour, and not to the neighbourhood of the Atlantic Ocean in the latitude, that we are to attribute the high temperature of this part of the world in the winter. The Atlantic Ocean is as near to Labrador as to Norway; but there is little condensation on the coast of the former, while there is much about the latter. Indeed, as far as we know, condensation of vapour is the only influence that operates exclusively on the eastern coasts of the

two oceans, the Pacific and Atlantic; and therefore to it we may attribute the warming of the localities, particularly in the Arctic Ocean, as indicated by the isothermal lines. Condensation, we know, furnishes a constant and abundant supply of heat, not like diffusion by contact, but by the energetic chemical action which converts an æriiform substance into a liquid, and consequently changes the heat from a latent to an active state.'

On the other hand, the extraordinary mildness of the winter which has just passed is attributed by several of our most distinguished meteorologists to the Gulf stream, which has within the last few months traversed the Atlantic in more than its usual volume. The temperature of the ocean near our coasts is said to have been from two to three degrees higher than usual; and it has been shewn that, if by any contrivance of dams, embankments, or sluices, we could control the passage of the stream, we might always insure a mild winter; or that, if our transatlantic neighbours, the Americans, could interpose barriers to prevent the flow in its present direction, they would at once give us a Siberian climate, with all our rivers and ports frozen up during nine months of the year. Happily the phenomenon is one of Nature's mightiest operations, over which man has no power; and while it continues we may hope from time to time to see such winters as the last, with no snow, and but little frost, and with so genial a temperature that the landscape lost not its greenness, the hedgerows seemed impatient to renew their buds, and in Middlesex and the adjoining counties primroses were gathered in abundance on sheltered banks as early as January.

PROFESSOR GREGORY ON CLAIRVOYANCE.*

A VERY considerable portion of the thinking world will be startled in the midst of their settled incredulity and indifference towards what are called the higher phenomena of animal magnetism, when they find a professor of physical science in the Edinburgh University not merely expressing his belief in them, but treating them in a laborious work which aims at assigning them their proper rank and place amongst the recognised phenomena of nature. It will be at once apparent, that for a scientific man of good reputation to avow his reliance upon a set of alleged facts which are generally ridiculed, is 'awkward' for him—few things being more damaging than an appearance of credulity. With generous minds, again, the very moral courage of the act ought to save him from being a loser by his avowal. This will more particularly be the case, if they give his book a perusal, for there they will find a calmness, a purity, and a geniality of feeling, as captivating to the affections of the reader, as the temperance of statement must be respectable in the eyes of his judgment.

Nor, it must be owned, is the learned professor's logic to be despised. To allege of these phenomena that they are 'obviously incredible and impossible, and therefore to be rejected without inquiry,' involves, he says, a complete *petitio principii*, or begging of the question. A pretension to know what is, or what is not impossible, is in the present state of science ludicrous. There are, indeed, some things which we know to be impossible—as that two and two could make more than four, or that the three angles of any triangle could make more than two right angles. But the facts in question are not of this character. They are at the utmost difficult to

* Letters to a Candid Inquirer on Animal Magnetism. By William Gregory, M.D., F.R.S.E., Professor of Chemistry in the University of Edinburgh. London: Taylor, Walton, and Maberly. pp. 626.

explain—which is the case of many facts which are admitted. A philosopher, for example, is entitled to assume, but he cannot *explain*, the law of gravitation. The laws of heat, light, electricity, magnetism, are in the same state. In answer to the allegation of deceit, it may be said, this being brought forward without inquiry, is merely one hypothesis against another. Some of the facts are irreconcilable with it; for example, the acceleration of the pulse, the fixed state of the pupil of the eye, and the cataleptic rigidity of the muscles. As to the many failures in public exhibitions—“were any man,” says the professor, “to fail in the simple experiment of dipping his finger, without injury, into red-hot melted lead, and to burn himself severely, we should not be justified in denying the fact that it may be done with impunity. A thousand failures could only prove that we did not perform, or know how to perform, the experiment properly; that we did not know, or did not attend to the conditions necessary to success; and one successful trial would outweigh them all. Precisely so is it,” adds our author, “with animal magnetism.”

What Dr Gregory demands, is only that the alleged facts should be inquired into. “When the witnesses are numerous, their character unimpeached, and the fact not physically or mathematically impossible, caution is not entitled to go farther than to say, ‘I am not satisfied; I must inquire into these things.’” If he [the sceptic] will not or cannot investigate them, let him in decency be silent. It may be added, that Dr Gregory disapproves of public exhibitions, and all regarding of the subject as a matter of amusement. He sees it to be a new and most important section of nature, and he desires it to be approached in a philosophic spirit, and brought to use only for the relief of suffering and the general benefit of mankind.

A large portion of the volume is occupied with a detail of the lower phenomena, respecting which the public is already pretty well informed. The author afterwards goes on to treat of sympathy and clairvoyance. The former involves community of sensation and emotion between the patient and his magnetiser. It also, in many cases, involves *thought-reading*; a perfect consciousness on the part of the patient of the ideas passing through the mind of the operator, even those referring to past times. Of patients with this degree of lucidity, some have announced things once known to the experimenter, but forgotten. Dr Gregory, however, surmises that this phenomenon may not be dependent on sympathy, but on that simple extension of knowledge which arises from clairvoyance. Another result of sympathy is the ability to tell of the bodily state of the operator—describing, for example, a diseased condition of the brain or heart, and announcing the sensations of those organs. Professor Gregory assures us of his having himself fully ascertained that this may be done in the absence of the individual, through the medium of a lock of hair, or any object that has been in contact with the person; even a recent specimen of handwriting. “Sympathy,” remarks our author, “is widely diffused as a natural spontaneous occurrence.”

How often does an inexplicable something warn certain persons that an absent and dearly-beloved friend or relation is in danger, or dying! This is an effect of sympathy. Every one has heard, in his own circle, of numerous instances of it. I am informed, for example, by a lady nearly related to me, that her mother always had such a warning at the time when any near and dear friend died. This occurred so often as to leave no doubt whatever of the fact. It happened that this lady more than once made the voyage to and from India, and that during the voyage she on several occasions said to her daughter and to others, “I feel certain that such a person is dead.” On reaching port, these perceptions were always found to be true!

Clairvoyance occurs both in the sleep and in a

conscious but still magnetic state, and it appears in various degrees of lucidity and power in different persons. The number of specialties connected with it is too great to be detailed here. The general fact, however, is a power of seeing objects at a distance, persons unknown to the patient in a waking state, and even individuals long dead. We select a case of the simplest kind, referring to individuals, some of whom are known to ourselves. At the house of Dr Schmitz, rector of the High School here, I saw a little boy of about nine years of age put into the magnetic sleep by a young man of seventeen. As the boy was said to be clairvoyant, I requested him, through his magnetiser, whom alone he heard, to visit mentally my house, which was nearly a mile off, and perfectly unknown to him. He said he would, and soon, when asked, began to describe the back drawing-room, in which he saw a sideboard with glasses, and on the sideboard a singular apparatus, which he described. In fact, this room, although I had not told him so, is used as a dining-room, and has a sideboard, on which stood at that moment glasses; and an apparatus for preparing soda-water, which I had brought from Germany, and which was then quite new in Edinburgh. I then requested him, after he had mentioned some other details, to look at the front room, in which he described two small portraits, most of the furniture, mirrors, ornamental glasses, and the position of the pianoforte, which is very unusual. Being asked whom he saw in the room, he replied, only a lady, whose dress he described, and a boy. This I ascertained to be correct at that time. As it was just possible that this might have been done by thought-reading, although I could detect no trace of my sympathy with me, I then requested Dr Schmitz to go into another room, and there to do whatever he pleased, while we should try whether the boy could see what he did. Dr Schmitz took with him his son; and when the sleeper was asked to look into the other room, he began to laugh, and said that Theodore (Dr Schmitz's son) was a funny boy, and was gesticulating in a particular way with his arms, while Dr Schmitz stood looking on. He then said that Theodore had left the room, and after a while that he had returned; then that Theodore was jumping about; and being asked about Dr Schmitz, declined more than once to say, not liking to tell, as he said, but at last told us that he also was jumping about. Lastly, he said Dr Schmitz was beating his son, not with a stick, although he saw a stick in the room, but with a roll of paper. All this did not occupy more than seven or eight minutes; and when Dr Schmitz returned, I at once gave him the above account of his proceedings, which he, much astonished, declared to be correct in every particular. Here thought-reading was absolutely impossible; for neither I, nor any one present, had the least idea of what Dr Schmitz was to do; nor indeed had Dr Schmitz himself, till I suggested it, known that such an experiment was to be tried. I am, therefore, perfectly satisfied that the boy actually saw what was done; for to suppose that he had guessed it, appears to me a great deal more wonderful.

Major Buckley is an amateur magnetist of great activity, with some peculiarities of practice, which need not be dwelt upon. He has brought 142 persons, almost all of the upper classes, into a state of lucidity. A favourite experiment with him is to cause gentlemen to purchase a quantity of those nuts which are to be had in confectioners' shops, having mottoes enclosed, and to bring these to his patient, who will read the motto within. He has had forty-four persons capable of performing this feat. The longest motto read by any of them was one containing ninety-eight words. Many subjects will read motto after motto without one mistake. In this way the mottoes contained in 4860 nutshells have been read. Sir T. Willsdore took home with him a nest of boxes belonging to Major Buckley,

and placed in the inner box a slip of paper, on which he had written a word. Some days later he brought back the boxes, sealed up in paper, and asked one of Major Buckley's clairvoyantes to read the word. Major Buckley made passes over the boxes, when she said she saw the word "Concert." Sir T. Willshire declared that she was right as to the first and last letters, but that the word was different. She persisted, when he told her that the word was "Correct." But on opening the boxes, the word proved to be "Concert." This case is very remarkable; for, had the clairvoyante read the word by thought-reading, she would have read it according to the belief of Sir T. Willshire, who had either intended to write "correct," or in the interval, forgot that he had written "concert," but certainly believed the former to be the word.

Dr Gregory publishes a letter from a clergyman, regarding a poor man named James Smith, residing at Whalsay in Shetland, who has lately been attracting local attention as a clairvoyant. The reverend writer went, full of incredulity, to test the reality of the matter, and, most unexpectedly to himself, was forced to own that there could be no deception in it. 'One evening, after he had been thrown into the mesmeric sleep, my friend and fellow-traveller asked him to accompany him to a certain place which he was thinking of, but the name or locality of which he did not mention, nor in the least hint at. The clairvoyant described the house, first the outside, with "big trees" round it, then several rooms in the interior; and being directed to enter a particular apartment which was indicated to him by its position, he described the appearance and occupation of a gentleman and two ladies who were in it; declared that he saw a picture over the mantelpiece; and being farther questioned, deposed that it was the picture of a man, and that there was a name below it; and being urged to read the name, after experiencing some difficulty with the penmanship, he affirmed that the last word of the name was "Wood," which he slowly but correctly spelt. The house was near Edinburgh; and when we came to compare notes, on our return from Shetland, we found that the description of the individuals in the room at the time had been quite correct; and we saw over the mantelpiece a print of the Rev. J. J. Wood of Dumfries, with his name written below.'

The narrator continues—'He went in search of Sir John Franklin, and found the ships *Erebus* and *Terror*, spelling the name of each on the stern of the vessel. I am sorry now that I did not make such full and explicit inquiries upon this subject as its importance and the interest attaching to it deserve; or as it would have been proper to institute, in order to compare the statements of this clairvoyant with those of others. During the time when I had him in hand, my experiments were almost entirely of a kind which were fitted to be conclusive upon the spot. However, I heard him declare that the *Erebus* was fast locked up; that those on board were alive, but in low spirits; and that, in answer to his inquiries, they said that they had little hope of making their escape. He affirmed that there was water for a certain distance round the *Terror*, but that she was not clear of the ice. Of course I gave no opinion as to the correctness of these revelations. The date when they were made was about the 22d of August 1850. When sent to these northern regions, and as long as he was kept there, he appeared to be shivering with cold, and declared the cold to be intense.'

A clairvoyante girl, of humble grade, under the care of Dr Haddock of Leeds (her name is given as E—), who has been remarkably successful in many cases where a test was applicable, had a specimen of the handwriting of Sir John Franklin submitted to her in the course of the winter before last. She found the unfortunate navigator in one of two vessels, fixed in ice, and surrounded with walls of snow. 'She described,' says

Professor Gregory, 'the dress, mode of life, food, &c. of the crews. She saw and described Sir John, and said that he still hoped to get out, but was much surprised that no vessels had come to assist him. She frequently spoke of his occupations, and when asked the time of day, found it either by looking at a timepiece in the cabin, or by consulting Sir John's watch. During the winter and spring of 1849-50, and part of the summer of 1850, she uniformly indicated the same difference of time, which I cannot at present give precisely, but which was nearly seven hours. At whatever hour she was magnetised and sent there, she always made the same difference. Nay more, when the time there was nine or ten A.M. (four or five P.M. at Bolton), she would say that such was the hour, but that it was still dark, and lights were burning in the early part of summer. Now, it is quite absurd to suppose that this totally uneducated girl has any notion of the relation of longitude to time, or of the difference between an arctic day and one in our latitude. E— also, being shewn the handwriting of several of the officers of the expedition, found and described them. One was dead (shelled, as she said, when she was asked.) Another, at a later period, was dangerously frostbitten, but recovered. She said, that in one of the ships the provisions were exhausted, but that the other contained provisions. She described the fish, seals, and other animals hunted and killed for food and oil by the crews. Of, or rather to, one officer she said that he was the doctor, although not dressed like a doctor, but like the rest, in skins; that he was a first-rate shot, and was fond of killing animals to preserve them. (This is really the case with Mr Goodsir, whose writing she was then examining.) She added a multitude of curious details, for which I have no space, and they will no doubt be published by Dr Haddock. But I may mention, that on a Sunday afternoon in February 1850, she said it was about ten A.M. there, and described the captain (Sir John) as reading prayers to the crew, who knelt in a circle, with their faces upwards, looking to him, and appearing very sorrowful. She even named the chapter of St Mark's gospel which he read on that occasion. She also spoke, on one occasion, of Sir John as dejected, which he was not before, and said that the men tried to cheer him up. She further spoke of their burning coarse oil and fish refuse for warmth, and drinking a finer oil for the same purpose. All this time she continued to give the same difference of time, from which the longitude might be calculated. This time, seven hours, or nearly, from Bolton, gives a west longitude of about 100° to 115°, which corresponds very well with the probable position of Sir John. But at a later period, all of a sudden she gave a difference of time of somewhere between six and seven hours, indicating that the ships had moved eastward. She was not, after this, quite so uniform in the difference of time as before, and seemed not to see it so clearly; but she persisted that they had moved homeward; and if we take about 6½ hours as the later difference, this would indicate a longitude of about 97° 30' W. After this change she also said that Sir John had been met and relieved, and has always since then seen three ships, which, for a long time past, are said by her to be frozen up together. The last observation of which I have heard, 17th February 1851, gave a longitude of 101° 45' W. At the same time, from Captain Austin's writing, which has also been frequently tried, she gave for him the longitude of 95° 45' W. She does not know whose ship it is, that, according to her, has met with Franklin, but she still speaks of three ships together. I should add, that when E— has been sent there at such an hour and season that it was night in those latitudes, she has quite spontaneously described the aurora borealis, which she once saw, as an arch, rising as if from the ground at one end, and descending to it again at the other. From this arch coloured

streamers rose upwards, and some of these curved backwards. She was much surprised and delighted with it, and asked if that was the country the rainbow came from. She had never been told anything whatever about the aurora, and knows nothing of it.

The reader will appreciate the degree of confidence which a believer in clairvoyance will repose in this interesting vaticination, when he learns what is said to have been accomplished in other cases by E—. Having been shewn the handwriting of a Mr W. Willey, and his friend Mr Morgan, who were travelling in California, she gave an account, which was found to be quite correct, of their persons and occupations, and of various occurrences connected with them. She described Mr Morgan as ill of a fever, and as having had a dream regarding his wife coming to see him. She also said that he had fallen overboard. All of these particulars, and many others, though quite unknown at the time in England, proved true. Sir Walter C. Trevelyan, Baronet, having received a letter from a lady in London, in which the loss of a gold watch, supposed to have been stolen, was mentioned, sent the letter to Dr Haddock, to see whether E— could trace the watch. She very soon saw the lady, and described her accurately. She also described minutely the house and furniture, and said she saw the marks of the watch (the phrase she employs for the traces left by persons or things, probably luminous to her) on a certain table. It had, she said, a gold dial-plate, gold figures, and a gold chain with square links; in the letter it was simply called a gold watch, without any description. She said it had been taken by a young woman, whom she described, not a habitual thief, who felt alarmed at what she had done, but still thought her mistress would not suspect her. She added, that she would be able to point out the writing of the thief. On this occasion, as is almost always the case with E—, she spoke to the person seen, as if conversing with her, and was very angry with her. Sir W. Trevelyan sent this information, and requested the writing of all the servants in the house to be sent. In answer, the lady stated, that E—'s description exactly applied to one of her two maids, but that her suspicions rested on the other. She also sent several pieces of writing, including that of both maids. E— instantly selected that of the girl she had described, became very angry, and said: "You are thinking of pretending to find the watch, and restoring it, but you took it—you know you did." Before Sir W. Trevelyan's letter, containing this information, had reached the lady, he received another letter, in which he was informed that the girl indicated as the thief by E— had brought back the watch, saying she had found it. In this case Sir W. Trevelyan was at a great distance from Bolton, and, even had he been present, he knew nothing of the house, the watch, or the persons concerned, except the lady, so that, even had he been in Bolton, and beside the clairvoyante, thought-reading was out of the question. I have seen, in the possession of Sir Walter, all the letters which passed, and I consider the case as demonstrating the existence of sympathetic clairvoyance at a great distance.

It chanced that, while this article was in preparation, we received a communication containing an account of a domestic experiment in clairvoyance, performed under the care of a gentleman previously incredulous, but who is now converted to a different way of thinking. It is not of uncommon interest in itself: perhaps it rather falls below the average in this respect; but it has an important feature in being reported by a gentleman perfectly known to us, and who is also pretty generally known throughout a large district in the south of Scotland as a man of probity, and by no means of a facile character. We therefore append it:—

*CLERCHFOOT, April 21, 1851.

'A young lady, Miss M—, being here on a visit, was put into the mesmeric trance by a young gentleman,

Mr W—, son of my worthy friend, a clergyman of the established church. Mr W— then asked the young lady to accompany him to the manse. To this she at first objected, on the ground of not being acquainted. This scruple being got over, they entered a carriage, and drove off. Mr W— then said, "You are in the manse dining-room; look round, and tell us what you see?" She replied, "I see the minister sitting in an arm-chair by the fire, and doing nothing." She was then asked if she saw any other person in the room—she said, "I see Mrs A— sitting sewing at the end window." Asked colour of the seam—she said, "White." Saw no other person in the room. Looked round again, and said, "Mrs A— had left the room." Then asked if she saw any paintings in the room—she said, "Three." Mr W— said, "Look round again;" when she said, "I see other two—five in all." She said she saw the portraits of a lady and gentleman above the fireplace. Asked to read the name—she said, "The duke." Asked what duke—she said, "Buccleuch."

'She was then asked to read the name at the bottom of another portrait—she said, "There was a mist before her eyes: she could not read; but it began with G. Asked the number of windows—she said, "Two." Asked the colour of the window-curtains—she said, "Red:" the colour of the table-cover in the middle of the room—she said, "Red." Asked if there was a bookcase in the room—she said, "Yes; near the end window."

'I wrote down the above answers as they were given, in presence of other two ladies and a gentleman. I rode to the manse next day in company with Mr W— (a distance of four miles), and after a rigorous inquiry, we found the above answers of the clairvoyante accurate to the very letter.

'Now here is a case of clairvoyance liable to no possible objection. Collusion, from the character of the parties, is out of the question; and from the circumstances, impossible. The lady had never been in the manse but once when a girl; and when out of the mesmeric state, she had no idea of anything which the house contained. It is worthy of notice that the red tablecover had not been used except for some time that forenoon, and was not on the table next day when we arrived. Miss M— knows that two young ladies lived in the manse, but them she could not be made to see; and they were from home, unknown to the clairvoyante.

WALTER TOD.

Dr Gregory thinks that the oracles, and many other of the so-called impostures of antiquity—second-sight among ourselves, and the magic mirror of Dr Dee—may yet be explained 'as connected with animal magnetism in some of its innumerable developments.' Assuming that there is such a thing as spontaneous clairvoyance amongst us—that is, clairvoyance without the use of external means to bring it on, and perhaps the result of a diseased condition of the nervous system—it is very certain that such a person in early superstitious ages would be looked upon as endowed with supernatural knowledge. To eke it out, or mix it up with imposture, and convert it to the support of a religious system, would also be very natural. If the facts of clairvoyance be ever generally admitted as scientific truths, it will be a curious consideration that such things may be more readily embraced in a superstitious than in a scientific age—science thus appearing as more calculated to limit than to enlarge the bounds of knowledge. The reason is, that science, from its own peculiar methods, tends to create an exclusive favour for things perceptible to the senses, and to set at naught, if not utterly condemn, the whole range of things spiritual. Here we find ourselves on the borders of one of the great questions of our time—one which threatens to lead to serious collisions ere many years go about. But we must refrain from speculation.

Suffice it that we bring before our readers even these imperfect illustrations of a curious topic of the day, leaving the candid to inquire, and the egotistic to rest satisfied that they, without any inquiry, know a great deal better how things really stand in respect of animal magnetism than those who, having seen, now believe.

THE BEREAVED TROMBONE.

I HAVE been for the last dozen years in the habit of walking daily to office in one direction, through a line of route reaching from a northerly suburb to the heart of the city, and back again in the evening, or late at night, as it might happen, by the self-same track. During that period, without asking a single question, or receiving a tittle of verbal information, I have learned the personal and domestic histories of many individuals and families, as well as the rise and management, and the consequent results and issues of a host of speculations, commercial and other, which have had their progress and consummation within the sphere of my continued remark. I may chronicle some of these histories when the humour seizes me—not now. One dilapidated figure, familiar to my morning vision, which he greeted two or three times a week for the last ten years, has disappeared for ever, and I dedicate this brief page to his remembrance. For the last twelve weary months he has figured periodically in the vicinity of — Square, as a butt—a walking target for the stray shafts of the vagabond wit of a gaping and jibing crowd; and, indeed, a stranger to his history might well have been excused for joining in the laugh of the multitude. There is, however, too often food for melancholy in the forms which excite our mirth. Smiles and sadness not unfrequently live together; and some of the vicissitudes incidental to humanity at times present themselves to view under such strange and anomalous aspects, that whether we ought to laugh or to weep, to hate or to sympathise, it is next to impossible to tell.

The defunct subject of this short memorial wandered for the last year of his life as a solo player on the trombone. Such a performance was unique in the history of street minstrelsy, and though anything but vivacious in itself, was the cause of infinite vivacity in others. The very first intonations from his dreary tube were a signal for a general gathering of the idling youngsters of the neighbourhood, amongst whom, in ragged but majestic attitude, stood the forlorn performer, filling the air with the sepulchral tones of his instrument. His dismal, dolorous, and almost denunciatory strain, drew forth ironical cheers and bravos from his grinning audience; and their persecuting demands for 'Paddy Carey,' or 'Rory O'More,' were answered by a deep-toned wail from the sonorous brass, giving mournful utterance to emotions far different from theirs. To me, and perhaps to others to whom the poor fellow's history was known, there was little cause for mirth in the spectacle he presented. Let the reader judge.

It is now full ten years ago, that as I drew near — Square, one fine spring morning, on my way to business, I heard, for the first time, the exhilarating strains of a brass band; the instruments were delicately voiced, and harmonised to a degree of perfection not too common among out-of-door practitioners. My ear, not unused to the pleasing intricacies of harmony, apprised me that a quintet was going forward, composed of two cornets à piston, a piccolo flute, a French horn, and a trombone. The strain was new, at least to me, and of a somewhat wild and eccentric character. Upon coming up with the band, I beheld five tall, erect, and soldier-looking figures, 'bearded like the pard,' and with some remaining indications of military costume yet visible in their garb. I set them down for Poles, and learned afterwards that my conjecture was the true

one. They were all men of middle age; and from the admirable unity and precision of their performance, it was plain that they had even then been long associated together. For two years I enjoyed at regular intervals, in my morning walks, the delightful solace of their harmonious utterances—and have been conscious more than once of marching à pas de soldat, under the influence of the spirit-stirring sounds, to the drudgery of labour, as though there were a heroism (who says there is not?) in facing it manfully. At the commencement of the third year, I missed one of the cornets à piston; and knew within a month after, by the appearance of a ligature of black crape, displayed not upon the heads, but upon the left arms of the survivors, that he had blown his last blast, and finally dissolved partnership with his brethren.

Still, quartetts are delightful; and though that peculiar and piquant undercurrent of accompaniment which makes a well-played quintet such a *bonne-bouche* to the amateur was ever afterwards wanting, yet was their performance perfect of its kind, and left no cause for cavil, however much there might have been for regret. But the grim tyrant seldom contents himself with a single victim; and in something more than a year after there was another void in the harmony—the French horn had gently breathed his own requiem, and reduced the band to a trio. This was a far worse loss than the first, and one that completely altered the character of their minstrelsy. They had fallen from their high estate, and were compelled to take new ground and less pretentious standing. They abandoned almost entirely—one may conceive with what regret—their own cherished national harmonies, and took up with the popular music of the metropolis—the current and ephemeral airs of the day. To these, however, they added a new charm by the exquisite precision of their execution, and an agreeable spice of foreign accentuation, which they naturally imparted to our matter-of-fact musical phraseology. They became popular favourites, and for several years went their accustomed rounds, everywhere rewarded with the commendations and coins of the crowd. Their imperturbable gravity and dignity of demeanour was a pleasant set-off to their rollicking version of some of the pet melodies of the mob, and contributed not a little to procure them a degree of favour and prosperity perhaps greater than they had ever previously enjoyed. They never forsook their old haunts, and I heard them regularly on the usual days, not certainly with the same delight as at first, yet often with a feeling of gratified surprise that so much grace could be imparted to airs which the 'Aminadabs that grind the music-boxes' in the streets of London had so mercilessly and so successfully conspired, first to murder, and then to mutilate.

Time wore on: year after year the gray and grizzled triumvirate trod their daily rounds in all weathers, arousing the liberality of their patrons with the merry music of the hour. Three, four, five years passed away—five harmonious years; and then death snatched the second cornet in the midst of his strain, and dashed him to the earth with a semibreve on his lips—lips condemned to be mute for evermore. The poor fellow was seized with the cholera while in the very heart of a melody, and had departed to the silent land almost before its echoes had died away. Whatever was the grief of the remaining pair, like true veterans as they were, they gave no evidence of it to the world. As they would have done on the battle-field, they did now—closed up their little rank, and confronted the enemy with the force that was yet remaining. But it was a sad spectacle, and, what was worse for them, it was but sorry music they made. With piccolo and trombone, the two extremes of harmony, what indeed could be done? Orpheus and Apollo themselves would have made a failure of it. It was the harmonic tree with only root and foliage—the trunk and branches all

swept away; or a dinner of soup and pudding, the intermediate dishes being wanting; or the play of 'Hamlet,' with none but the prating Polonius and the Ghost for *dramatis personæ*. In short, it wouldn't do; and the poor fellows soon found it out. They fell into neglect and poverty, and save among those who dwelt in the line of their regular beat, who now gave from sympathy what they had once bestowed from gratification, they met with but spare encouragement. It could not last long. Whether the piccola had too much to do, and sunk overborne by the responsibility of the various parts he represented, or whether he blew himself out in a fit of sheer mortification, I cannot pretend to say. True it is, however, that he also, in a few short months, disappeared from the scene, and the bereaved trombone was left to wander alone among the haunts of his old companions.

For twelve months, as I have already said, had he thus wandered, growling from his dismal instrument a monotonous requiem to the manes of his departed brethren. I have reason for believing, that at the decease of his last friend he forsook the light and frivolous music, which circumstances had compelled them to administer to the mob, and returned to the wilder and grander themes of his country and his youth; but as it requires an experienced ear to tell the business a man is after who plays a solo on the trombone, I cannot pretend to certainty on that point. He never condescended to take the least notice of the crowd of scape-grace idlers who stood around, mimicking his motions, and raising discordant groans in rivalry of his tones. He played on with an air of abstracted dignity; and one might have thought that, instead of the jibes and jeers of the blackguard mob, he heard nothing but the rich instrumental accompaniments of his buried companions, and that memory reproduced in full force to his inner sense the complete and magnificent harmonies in all their thrilling and soul-stirring eloquence, as they rung through the same echoes in the years past and gone. He persevered to the last in treading the same round that was trod by his brethren: it was all that was left to him of them and of their past lives. He had indeed experienced the hardest fate of the whole five. He was the fitting ghost of the buried band—a melancholy memorial of extinct harmonies. There was a painful discrepancy between his history and his action: the sudden and fierce elongation of his brazen tube, as he shot it violently forth to double the octave at the penultimate note of his wailing stave, but ill accorded with the mournful recollections of which he was the solitary monument. There was a visible discord between his griefs and his gestures, his woes and his utterances of them, which transformed the very fount of melancholy into an argument for mirth. From a position so painfully equivocal, I, for one, can rejoice that he has at length been beckoned away. There is none to mourn his departure, and, beyond this brief testimony, no record that he ever was. *Requiescat!*

THE DRYING PROCESS.

A RAPID drying is of very great importance in several of the arts and manufactures. Till a recent period, the usual methods were alone resorted to, even where the largest results were concerned, and great impediments were thus experienced; but now there is a patent process, by which the end is gained with equal rapidity and certainty, and on a scale of any required magnitude. The main feature of the plan is simply to produce a current of pure heated air through a chamber in which articles required to be dried are exposed. The temperature of the air can be raised or lowered, so as to suit the requirements of a great variety of substances. In

the case of various kinds of cloth goods, the effect on quality and colour is said to be favourable.

This process has been extensively applied in large wash-houses, including those connected with such public establishments as unions and hospitals. By the command of so much more than the usual amount of heat, and by the extreme desiccation attending this elevated temperature, large quantities of clothes are dried in a wonderfully short space of time; and not merely this, but they are thoroughly freed from 'the peculiar smell which generally belongs to the clothes used by the very poor.' In hospitals, the process is also used expressly for the destruction of all morbid and infectious matters which may linger about the clothes of the patients. At a temperature of from 200 to 250 degrees Fahrenheit, it is most efficacious in this respect, without in the slightest degree injuring the clothes or other articles subjected to it. Feathers are in like manner prepared for use very much more rapidly, as well as effectually, than is customary. It has also a beneficial application to coffee-roasting, and to the preparation of farinaceous food and potatoes for long voyages by sea.

The drying of wood for building, cabinetmaking, and the manufacture of pianos, has hitherto been a tedious process as left to time. It can now be done expeditiously by the Desiccating Process, and with much more certainty. This is a matter in which the public is much interested, for a rot in the timber of public or private buildings, or a warping in articles made of wood, is a serious evil. The wood used in the New Coal Exchange in London was desiccated, or deprived of the vegetable juices, by this process, and to all appearance with entire success. The beautiful floor of this Exchange is composed of four thousand pieces of wood, including ebony, black oak, common or red English oak, wainscot, white holly, mahogany, American elm, red and white walnut (French and English), and mulberry—presenting, in large figures, the mariner's compass, the city arms, and other objects. The whole of these pieces were, a few months before, either in the living tree, or in logs which otherwise would have been far from fit for use. The black oak introduced as a portion of the floor was a part of an old tree which was discovered and removed from the bed of the Tyne River but a very short time before being used. This tree is supposed to have grown on the spot where it was found, and owing to its large dimensions, must have been at least 400 or 500 years old at the time it fell; but how many centuries it has been covered with water it is impossible to say. A considerable portion of this tree was, at the request of Mr Davison (to whom the execution of the floor was intrusted), forwarded to London by the mayor and corporation of Newcastle. Of course it was completely saturated with moisture on its arrival. Nevertheless, the drying, as we have seen, was quickly effected. In fact, no one piece out of the 4000, composing the floor, occupied more than ten or twelve days in seasoning.

For shipbuilding purposes this process has been adopted very successfully. Planking, applied to docks or otherwise, and all interior fittings, can be surely depended on as capable of withstanding all variations of temperature or weather, and there is not, therefore, the necessity of keeping large stocks of wood to season; the saving must eventually be to the advantage of the public.

A good while ago, very interesting experiments were instituted to test the qualities of various woods seasoned by this process, as compared with similar woods, but seasoned in the best way otherwise. They were conducted under the superintendence of the Board of Ordnance. From the results obtained from about 120

specimens, compared with the best-seasoned samples which our government stores could supply, the Dedicating Process proved that all woods subjected to it were stronger and more elastic than those seasoned by the usual methods. Mr Lovell, Her Majesty's Inspector of Small Arms, thus testifies to the superiority of this process in seasoning wood for ordnance purposes: 'It would be tedious to go into the detail of all the other tests that this process has been put to; it may suffice to say, that after every possible trial, all my doubts have been removed by the only safe guide—that of experience. The wood is better seasoned than when dried in the open air: first, because the albumen being dried into the pores and capillary tubes, the fibre is stronger, and less liable to absorb moisture; second, the wood is stronger, tougher, and of course more capable of withstanding the effects of violent vibration (as in firearms), from the lateral adhesion of the fibre being better preserved; third, it works more smooth and waxy under the chisel, and has less tendency to spall and crumble away, which is the great fault of steam-dried timber.' In consequence of the complete success of the experiments before named, the Board of Ordnance have used the process for some time extensively, and with great advantage to the service.

We have to acknowledge some obligations to the Dedicating Process, in respect of our own peculiar manufacture. Dryness in literature is apt to appear at first sight as a somewhat questionable recommendation; but, setting aside the joke, it is of no small consequence to printed sheets that they should be quickly and thoroughly freed from the moisture which they always bear on their issue from the press. Forty-eight hours of suspension over poles along the ceiling of the office used to be the plan resorted to. In these days, this is an insufferably long time to give to such a process. Besides, the arrangement is attended by some degree of danger. An improved plan is to suspend the sheets in a room devoted to the purpose, heated by steam-tubes. We have passed through these plans, and at length found entire satisfaction in the Patent Dedicating Process of Messrs Davison and Symington, which despatches in the drying of sheets effectually in twenty-four hours.

NOTES FROM THE NETHERLANDS.

WALK TO DE WYK—VILLAGE PUBLIC-HOUSE—ITS INMATES AND INCIDENTS—WALK TO OMMERSCHANS.

WHILE pacing along to Meppel, I made up my mind at all events to visit Ommerschans; instead, therefore, of halting on reaching the town about sunset, I left the main thoroughfare for a by-road, which, as usual, formed the towing-path of a canal. With the aid of a countryman going in the same direction, I passed for several miles through by-ways, and soon after dusk arrived at De Wyk. Almost the first house in the village was a *herbergje*; but there being no room, I went farther, and presently came to another—one of the long low edifices which appear to be peculiar to rural districts in the northern provinces, the same roof sheltering quadrupeds and bipeds. On opening the door, I found myself in a large kitchen, dimly lighted by a single candle standing on a table, round which sat a dozen rustics finishing their supper. Each one laid down his spoon, and stared at me vigorously, and for some time my question—'Kan ik hier overnachten?' ('Can I pass the night here?') remained unanswered: sundry ejaculations alone were uttered. By and by, both a mistress and maid appeared to minister to my needs, and tea and eggs were quickly in preparation. Meanwhile, the men at the table were

making me the subject of discussion among themselves, and eyeing me with curious looks. At length one of them asked me whence I came, and why I was there; which queries were answered to their satisfaction, when another rejoined:

'And so mynheer comes from Fredericksoord, and is going to Ommerschans?'—an observation which elicited a grunt of approval from the whole company.

'But how does mynheer find his way?' inquired the first speaker.

'That is not very difficult. With a map in his pocket, and a tongue in his head, a man may go all over the world.'

'Ja, that is good; but it is not easy sometimes to know which turning to take. What does mynheer do then?'

'I generally get to know the direction of the place I want to go to before starting, and then steer my way by the sun or wind; and seldom fail to arrive, as you may see by my being here.'

This explanation sufficed them for a time as a topic for further discussion, and left me free to attend to my personal wants, which were in the imperative mood. Before long, however, one of them began again by asking, 'What has mynheer to sell?'

'Nothing: my knapsack contains only articles for my own use.' Here a brief confabulation followed, and I began to fancy the Dutchmen not less expert in gathering information than the New Englanders, when the question came—

'Mynheer travels, then, for his own pleasure?'

'Why not?'

'Ah, mynheer says why not; but when one travels for pleasure, he must have so much money in hand; and as he said this the speaker tapped significantly the palm of one of his hands with the fingers of the other.

Whether it was that they voted such journeyings an unwholesome extravagance, or that their ideas were all exhausted, the group said no more; and shortly afterwards kicking off their stained and clumsy sabots, they retired, without any further process of undressing, to their sleeping-lairs. Some crept into a loft, others into beds contrived as berths in a ship, in recesses in the walls of the kitchen, two into each; and before I had finished my tea, a concert of snores was going on, where the bass certainly had the best of it.

I have often found that a fatiguing walk on a hot day takes away all relish for ordinary food: the appetite seems to demand some novelty—and it was with no small pleasure that I accepted the landlady's offer to add a plate of *framboose* (raspberries) to my repast; their cool and agreeable flavour rendered them even more refreshing than the tea.

In the intervals of talking and eating I had taken a survey of the apartment, as far as it was illuminated by the solitary candle: it was one that carried you back a century or two. The large hearth projected several feet into the room, overhung by a canopy near the ceiling of equal dimensions; and the top and back being lined with glazed white, blue, and brown tiles, glistened as the light fell upon them from the turf fire, and presented a cheerful aspect. A wooden screen fixed at one side kept off draughts of air, and formed a snug corner for cold evenings. The tables and chairs had been fabricated in the days when timber was cheap, and strength was more considered than elegance. They had little to fear from contact with the uneven paved floor. A 'goodly array of bright polished cooking utensils hung upon the walls, and in racks overhead a store of bacon and salt provisions, and bags and bundles of dried herbs. Although rude in

its appointments, and coarse in its accommodations, the dwelling betrayed no marks of poverty: it was perhaps up to the standard of the neighbourhood, and in accordance with the thrift that considers saving better than spending. The greatest discomfort—to me at least—was the close overpowering smell of cattle which pervaded the whole place, and made you long for an inspiration of purer air. From my seat I could see into an adjoining apartment, similar, but better in character, to the one described: this was to be my *slaap-kamer*. I requested to have the window left partly open all night, and immediately a look of suspicion came over the old woman's face as she answered: 'Neen, mynheer, neen; best not to have the window open; thieves will come in.'

'Surely,' I replied, 'there are no thieves in this little village?'

'Ah, but there were some thieves at Meppel last week.'

The landlady's apprehensions seemed so painful to her, that I ceased to press the question, and followed her into the room, where she assured me I should find the air sufficiently respirable, and bade me *goede nacht*.

In this room there were several wall-recesses, as in the other, but cleaner and better fitted up. A bedstead at one corner, behind a narrow screen extending a few feet from the door, was intended for me; the sheets and coverlets, though coarse, were clean. Three wardrobes or presses stood against the walls, so richly dark and antique in appearance, and of such tasteful workmanship, that you at once knew the date to be assigned to their manufacture, probably about the time that the Prince of Orange fell beneath Geraart's pistol-shot; at all events when, instead of working by contract, artificers interused a portion of their own spirit into the productions of their skill. The chairs, by their dimensions, had been clearly intended for the past generations, who wore the broad skirts at which we so often smile in prints of old costumes. The projection of the larger articles of furniture produced sundry picturesque effects of light and shade, relieved and diversified by the rows of polished pewter dishes ranged on racks against the wall alternately with dishes of rare old china, that would have gladdened the eyes of a virtuoso. There were rows of spoons also of shining solid pewter, all betokening resources of substantial comfort, and assisting to give effect to a picture which fully occupied my attention while undressing.

The hostess, when she went out, had not closed the door; this I cared little about, as it afforded some facility for circulation of air; but her remark touching the thieves made me take the precaution to place my watch and purse under the pillow, leaving such loose florins as were in my pocket for any prowler who might think it worth while to pay me a visit, that, finding some booty, he might there cease his search for more. I left the candle burning on the table, and soon afterwards the girl came in and wished me a *goede nacht* as she carried it away.

Presently all became still in the house, and as weariness softens the hardest bed, I was soon asleep, notwithstanding the annoyance from certain insects, which were neither bugs nor fleas, that came crawling over me. I had lain thus in quiet repose perhaps for two or three hours, when I was disturbed by a light shining in the room, and half-raising my eyelids, I saw a tall figure clothed in white, holding a candle in its hand, and gazing stealthily at me from behind the screen at the foot of the bed. I did not start up or cry out, for a sufficient reason—I was too drowsy. The figure withdrew, the room again became dark; I turned round, and slept soundly until morning.

I was up soon after five, being desirous to recommence my walk before the heat came on, and, it need scarcely be said, found all my property as I had left it. The old presses looked not less imposing than in the

faintly-illuminated gloom some hours previously; and I could see in the daylight several articles which had then escaped my notice. Among them was the *grote bijbel*, a portly folio in black letter, and in good condition. How many suffering hearts had found support and consolation in those ancient pages! When I went into the next room, the labourers had taken their breakfast, and gone to their work, and the old lady sat near the window mending stockings. She saluted me by inquiring if I had *wel geslaapt*, and what I would take for breakfast. I chose raspberries with milk and bread, and highly enjoyed the fresh-gathered fruit that looked so tempting, coated with its early bloom. It was the most acceptable breakfast of any which I ate in Holland. The hostess chatted on various topics: in one of my replies, I chanced to mention the large Bible which I had seen in the other room—'Ah,' she said, 'it is the best of books: what should we do without it?' I then told her that a little Bible was part of the contents of my knapsack, and on hearing this her manner at once changed; the suspicion disappeared, and the benevolent demeanour resumed its place. My request of the night before concerning the window had made her very anxious; she had, it seemed, been led to regard me as a suspicious character—as one likely to let in a confederate, or to decamp myself surreptitiously. From this I at once understood it was she who, clad in white, and holding a candle, had come into my room during the night; perhaps to see whether her guest were lying still, as an honest traveller ought. We became, however, very excellent friends, and I regretted not having time to stay two or three days, to get a little farther insight into village life, and the pursuits and resources of its inhabitants: but that could not be. I was somewhat surprised on asking '*Hoe veel betalen?*' (How much to pay?) at the cheapness of my lodging and entertainment: the charge was only eighteen stivers. I handed a florin to the old lady, with an intimation that the two stivers' change might go to the maid for her alacrity in raspberry plucking, on which she replied, '*Dank voor haar*,' with much emphasis. Then holding out her hand, after assisting to place my knapsack in position, she bade me good-by, with many wishes for a prosperous journey.

It was a pleasant morning, with a bright sky and a hot sun, and a feeling of exhilaration came over me as I left the close sickening smell of the house for the free and fresh air outside. The aspect of the country was again different from that which I had already traversed. Willows, so plentiful in the southern provinces, are rare on the dry heath-lands of the north, while small plantations, and woods of birch, beech, and oak, are frequently met with. At times the route led along narrow winding lanes, between tangled hedges and overhanging trees, where the shade and coolness made you feel the contrast the greater on emerging upon the unsheltered and unfenced fields. Before long, I came to another village, where the houses were built at random around a real village green, such as you may see in some parts of Berkshire or Hampshire, with tall umbrageous trees springing from the soft turf, and old folk lounging, and children playing in their shadow. The post, which visits the towns of Holland every day throughout the year, comes to such villages as this two or three times a week, and thus keeps up its communications with the great social world around. In another particular they are well provided for—the means of instruction. Here at one end of the green stood the schoolhouse, built of brick, well lighted, and in good condition, decidedly the best building in the place. Indeed I do not remember to have seen a shabby schoolhouse in Holland. It was too early to see the scholars at their duties, but I looked in at the windows, and saw that the interior was perfectly clean and well-ordered; fitted with desks, closets, and shelves, with piles of books placed ready for use on the latter,

and maps hanging on the walls. How I wished for a six months' holiday, to be able to linger at will among these out-of-the-world communities, or wherever anything more particularly engaged my attention! Something to inform the mind or instruct the heart is to be given or received wherever there are human beings. Soon after passing the village, the road terminated suddenly on a part of the wild heath, where the sand for nearly a mile on all sides lay bare, gleaming palely in the sun, and no sign of a track visible in any direction. For a few minutes I stood completely at fault, but at last bent my steps towards some scattered trees in the distance. The deserts of Africa can hardly be more dreary or trying to the wayfarer than that mile of sand was to me. On reaching the trees, I again found a lane leading through cultivated grounds; now a patch of grass, then barley, or wheat, or potatoes, or buckwheat—the delicate blossoms of the latter scenting the whole atmosphere, and alive with 'innumerable bees.' While standing still to listen to their labour-inspired hum, I heard the cuckoo telling his cheerful name to the neighbourhood, although past the middle of July. Then followed homely farms, standing a little off the road, the homestead surrounded by rows of trees, somewhat after the fashion of Normandy; and in one corner of the enclosure the never-failing structure—four tall poles, erected in a parallelogram, with a square thatched roof fitted upon them, sloping down on each side from a central point. The poles pass through the corners of this roof, which thus can be made to slide up and down, according as the produce stored beneath it is increased or diminished. Such a contrivance would perhaps be useful to small farmers in England, when straitened for room in their barns. Now and then I caught glimpses of haymakers working far off on a meadow patch, and more than once the signs of tillage disappeared, and there was the broad black heath under my feet, and stretching away to the horizon, here and there intersected by a series of drains, cut smooth and deep in the sandy soil, enclosing some acres of the barren expanse—the preliminaries of cultivation. Then would come a mile or so of woodland, with the thinnings and loppings of the trees cut into lengths, and piled in stacks ready for the market, as I had seen on the wharfs at Rotterdam, where firewood sells at eleven cents the bundle. A party of woodcutters, with their wives and children, were encamped at the entrance of a cross-road, disturbing the general stillness by the sound of their voices and implements. The men and women were alike tall and stout—remarkable specimens of the well-developed population of the province, and reminding you of the peasantry in Westmoreland. The stacks which they had set up were so long and high as to resemble a street with little alleys between, where the children played while their fathers chopped and sawed, and their mothers tied the bundles, or tended the fire over which the round pot swung with the breakfast. They called out a friendly 'Good-day, mynheer,' as I passed.

As the day advanced, it became oppressively hot: not a drop of drinkable water was anywhere to be seen. I went to a cottage near the road to ask for a draught, when a pitcherful was given to me that looked like pale coffee, and was vapid and unrefreshing. The occupants of the cottage told me that they were always obliged to strain it before drinking, to free it from the filth of turf held in suspension. These people, their child, and their house, were positively dirty, and looked comfortless: the pigs lay in one corner of the kitchen, and the domestic utensils stood about in apparently habitual disorder. They, however, were kind in their manner, and wished me to sit down for a time and rest.

Besides these and the woodcutters I scarcely met a soul during the walk, which lasted nearly four hours, by which time I came to the outskirts of Ommerschans.

I went into the tavern that stood at the extremity of the long straight road leading through the centre of the colony, where, after half-an-hour's rest, ten minutes' sleep, and a cup of tea, I felt able to go and present myself to the director.

'CORRECT THYSELF!'

FROM THE FRENCH.

SOME years ago, there lived in the neighbourhood of Paris a retired military officer of high rank and large fortune. Possessed of many valuable qualities—brave, just, and honourable, there were two sad drawbacks to his character—he was violent-tempered and avaricious. He married a beautiful and gentle girl, whom he fondly loved, but who, nevertheless, often sought her chamber, weeping bitterly at the harsh and unjust reproaches which her husband heaped on her when the merest trifle had excited his ungoverned temper. Often, indeed, she felt terrified lest his violence should be more than verbal; and although his fits of rage were regularly followed by penitent apologies, she trembled at the thought that he might some day forget himself so far as to strike her.

It was very sad to see the happiness of a union formed under the most promising auspices thus destroyed by brutal and unmeaning fits of rage, which each day became more frequent. It required all the young wife's tenderness and fidelity to sustain her beneath the constant grief and terror which she felt. One day when the husband, in the presence of several visitors, had given way to a more than usually outrageous explosion of temper, he retired to his own apartment, whither he was followed by one of his friends—a true friend, who never shrank from administering a faithful reproof. Without regarding the officer's anger, the dying embers of which still glowed fiercely, this friend earnestly and severely lectured him for his unkind and unjust conduct. The culprit listened with a gloomy air, and then replied: 'Your reproaches are perfectly just: I condemn my own conduct far more strongly than you can do, and I make many resolutions of amendment, but without avail. My unhappy temper is too strong for me; and constantly in a few hours after the bitterest repentance, I find myself again breaking out. "His terrible!"

'It is, indeed, very terrible!'

'I have need of a strong lesson, and I shall give myself one.' So saying, he took several turns up and down the room, pacing with a determined step, his eyes bent on the ground, and his lips firmly closed. Evidently some strong internal conflict was going on. Suddenly he stopped, opened a casket which lay in his scrutoire, and took from it a bank-note of a thousand francs. His friend watched him with curiosity, not knowing what he was about to do. He twisted the bank-note, applied one end of it to a lighted taper, and then throwing it on the hearthstone, watched until the curling flame had quite devoured the light and precious paper.

His friend, amazed at an action which would seem strange for any one, but especially for one whose parsimony was notorious, ran to him, and caught his arm.

'Let me alone!' said the officer in a hoarse voice.

'Are you mad?'

'No.'

'Do you know what you have done?'

'I do: I have punished myself.' Then when no trace of the note remained, save a little light dust, the hero, for so we may call him, added firmly: 'I solemnly vow that, whenever I lose my temper, I will inflict punishment on my love of money.'

'I admire your conduct, and approve of your sacrifice,' said his friend.

The promise was faithfully kept. From that time

the avaricious man paid for the faults of the ill-tempered husband.

After every outbreak, he appeared before his own tribunal, and submitted to its self-imposed penalty. The condemned culprit then opened his casket, and, pale and trembling with suppressed agitation, took out a note and burned it. The expiation was always in proportion to the crime: there was a regular scale of penalties, varying, according to the nature of the offence, from 100 to 1000 francs.

A few of these chastisements had the happiest effect on both the defective phases of our hero's character. By degrees he became not only mild and good-tempered, but generous, and ready to dispense his treasures in ways which, if more agreeable to his friends, could not, however, be esteemed more useful to himself than the notes which he had bravely consigned to the flames.

THE TEMPEST PROGNOSTICATOR.

That leeches are sensitive to the approach of thunderstorms is well known. Cowper the poet gives an interesting account of a leech which he kept as a barometer, in a letter to Lady Hesketh, Nov. 10, 1787:—'Yesterday,' he says, 'it thundered, last night it lightened, and at three this morning, I saw the sky red as a city in flames could have made it. I have a leech in a bottle which foretells all these prodigies and convulsions of nature. Not, as you will naturally conjecture, by articulate utterance of oracular notices, but by a variety of gesticulations, which here I have not room to give an account of. Suffice to say, that no change of weather surprises him, and that in point of early and accurate intelligence he is worth all the barometers in the world. None of them all, indeed, can make the least pretence to foretell thunder—a species of capacity of which he has given the most unequivocal evidence. I gave but sixpence for him.' Dr Merryweather of Whitby in Yorkshire has constructed what he calls a Tempest Prognosticator, with leeches for the basis of the plan. He arranges a frame of twelve bottles, each containing a leech, and each having an open tube at the top. From a piece of whalebone in the opening of each bottle proceeds a brass chain, communicating with a bell hung in the top of the apparatus. Accordingly, when a tempest is approaching, the leeches rise in the bottles, displace the whalebone, and cause the bell to ring. Hitherto, after a year's experience, it is found that no storm escapes notice from the leeches. Dr Merryweather has also satisfied himself that it is the electric state of the atmosphere, and not the occurrence of thunder within human hearing, which affects the leeches. After this the Snail Telegraph looks not quite so outrageous an absurdity.

NEW FISHES.

Professor Agassiz gives an account of two new fishes obtained by him at Lake Superior, which he regards as types of two new genera. The first is an entirely new type in the class of fishes. It is a small fish, five or six inches long, which in some respects resembles several families, but is most like the Percoids, though distinct from them. Fossil species with similar characters are found in the cretaceous formation. This is the second, Professor Agassiz remarked, of the 'old-fashioned' fishes, so to speak, corresponding in their structure to a fossil species, which has been observed in this country. The other fish is the only living representative of a large family of fossil species. The existence of these two species has undoubtedly reference to the fact, that America is the oldest extensive continent which has been upheaved above the level of the sea. In New Holland, two genera exist bearing similar relations to older families—a fish and a shell—which have their analogues among the eolitic deposits.—*Proc. Boston Nat. Hist. Society.*

A NEW JEREMIAH.

A survey of the fate of all the great empires of antiquity, and a consideration of the close resemblance which

the vices and passions by which they were distinguished at the commencement of their decline bear to those by which we are agitated, leads (?) to the melancholy conclusion, that we are fast approaching, if we have not already attained, the utmost limit of our greatness; and that a long decay is destined to precede the fall of the British Empire. During that period our population will remain stationary or recede; our courage will, perhaps, abate; our wealth will certainly diminish; our ascendancy will disappear; and at length the Queen of the Waves will sink into an eternal, though not forgotten slumber. It is more likely than that these islands will ever contain human beings for whom sustenance cannot be contained; that its fields will return, in the revolutions of society, to their pristine desolation, and the forest resume its wonted domain, and savage animals regain their long-lost habitations; that a few fishermen will spread their nets on the ruins of Plymouth, and the beaver construct his little dwelling under the arches of Waterloo Bridge; the towers of York arise in dark magnificence amid an aged forest, and the red deer sport in savage independence round the Athenian pillars of the Scottish metropolis.—*Johnston's England as It Is.*

THE FLOWERS OF GOD.

BY REV. JAMES GILBORNE LYONS, LL.D.

'Consider the lilies of the field.'

THE welcome flowers are blossoming,
In joyous troops reveal'd;
They lift their dewy buds and bells
In garden, mead, and field;
They lurk in every sunless path
Where forest children tread;
They dot, like stars, the sacred turf
Which lies above the dead.

They sport with every playful wind
That stirs the blooming trees,
And laugh on every fragrant bush,
All full of toiling bees.
From the green marge of lake and stream,
Fresh vale and mountain sod,
They look in gentle glory forth—
The pure sweet flowers of God.

They come, with genial airs and skies,
In summer's golden prime,
And to the stricken world give back
Lost Eden's blissful clime.
Outshining Solomon they come,
And go full soon away,
But yet, like him, they meekly breathe
True wisdom while they stay.

'If God,' they whisper, 'smiles on us,
And bids us bloom and shine,
Does He not mark, oh faithless man!
Each wish and want of thine?
Think, too, what joys await in Heaven
The blest of human birth,
When rapture, such as woes thee now,
Can reach the bad on earth!'

Redeemer of a fallen race!
Most merciful of kings!
Thy hallowed words have clothed with power
Those frail and beautiful things,
All taught by Thee, they yearly speak
Their message of deep love,
Bidding us fix, for life and death,
Our hearts and hopes above.

PRICE 1½d.

A GLANCE AT THE EXHIBITION.

Weeks ago, through the ordinary channels of information, our readers were made acquainted with all that was interesting in the opening of the Great Exhibition; and so many will have already feasted their eyes with the extraordinary spectacle which that Exhibition daily offers, that anything we can say on the subject will appear commonplace and useless. And yet we should like, even at this distant period, to add a few observations to the general accounts of the affair, and to offer our congratulations on the auspicious event that has occurred.

Nothing has ever struck us as more preposterous than to attempt to convey by language any adequate description of the Crystal Palace. Every one who has seen it will have felt the impossibility of giving an account of either the fabric or its contents. The spaciousness of the interior, far transcending that of the greatest cathedral; the prevalence of light, resembling that of the open air, and an absence of all shadow; the aerial effect produced by this lightness, along with the delicate blue tinting of the numerous slender supports; the gorgeous assemblage of objects of art—snow-white statues, brilliantly-coloured tapestries, golden vases, sparkling fountains, inscribed crimson flags, the sign-boards of nations—and last, not least, the streaming, the loitering, the sitting and standing crowds of well-dressed people from all quarters of the globe—all are felt to be beyond the reach of words. In our estimation, the moral was grander than the physical part of the spectacle, when the Queen, with her husband and children, surrounded by the members of her court, inaugurated this festival of industry by her presence. One felt that this was not only a great but a new event in human annals. It seemed like the beginning of a fresh era—an era of peace and good-will, of progress and melioration. The last occasion in which we formed a unit in a national festival, was at a commemorative anniversary of the French Republic in May 1849. Then, we saw a chief magistrate in the garb and accoutrements of a soldier, surrounded by an army of one hundred thousand men; now, we saw a sovereign in the delicate form and dress of a female, take the lead in an important national ceremony, unaided by the symbols of force—needing no army to make up a show. Such things as these are the landmarks of history.

Now for a few words on the actual *mécanique* of the Exhibition. The Crystal Palace is seen at a glance to consist of two distinct parts—that on the west, or left hand of the main southern entrance, being devoted, above and below, to the United Kingdom and her dependencies; that on the east to foreign states.

Each class of objects is by itself. As Britain has one-half the house to herself, she accordingly has more space to shew off her productions than any other country. We should, therefore, in drawing comparisons, judge tenderly of what foreign states have to exhibit. Making every allowance on this score, it must be apparent that England has nothing at all to be alarmed about on the score of general and free competition. Of course she comes out strong in steam-engines and machines of every genus and species. That was to be expected; but perhaps to the surprise, and, it may be, to the mortification of certain onlookers, she has given unequivocal tokens of greatness in those objects in which elegance and taste are combined with utility: not that in various points she has come up to France or Italy; nevertheless, it is consolatory to see what she has done and can do.

Turning to the left, on entering by the southern portal, we find ourselves in Canada and other colonies. Ranged on the floor or long tables, or hung in cases, we observed specimens of raw materials and manufactures. And what 'latent possibilities of excellence!' We are sure every Englishman will feel proud of these manifestations; which indeed impart a new impression of our colonial strength. In cutlery, Nova Scotia seems to be becoming a match for Sheffield; and from that possession, as well as from Canada, there are pianos, furniture, and saddlery, equal to what are ordinarily seen in our own country. Comparing these and some other articles from the British American colonies with a similar class of things from the United States, it does not by any means seem they are so far behind as it has been the fashion to represent them. The Australian colonies likewise shew a wonderful power of production. The specimens of coal, iron, copper, leather, wool, flax, oil, and fine kinds of wood, are a tangible augury of the prosperous career which, under proper management, they may yet run. Woods from Van Diemen's Land and New Zealand may be expected to become a great article, not only for furniture but musical instruments. Cordage of the *Phormium tenax*, from New Zealand, is shewn in abundance; and of preserved beef and mutton, in air-tight canisters, from Australia, there are some remarkable specimens. We can only refer to the beautiful artificial flowers in shell-work, and fruits in wax, from the West Indies. The handsome sleighs of Canada must go undescribed. On the whole, we are pleased with our colonial brethren, and give them great credit for their industry and enterprise.

Next, after the colonies, comes the mediæval court, an enclosure devoted to a variety of objects in carved wood, metal, and tissues used in church decoration, the whole embodying that taste for middle-age archi-

texture and embellishment which it has been attempted to revive in recent times. Further on, in going westward, are the hardwares, the woollens, silks, and cottons, and the mixed tissues of the United Kingdom. Paisley is strong in shawls; Glasgow sends a large variety of articles; Macclesfield is rich in hangings and other fabrics. To go through the stalls of woollen cloths seems endless. We can but barely notice the tartans and tweeds from Galashiels and Innerleithen; and just recommend our friends to take a kindly glance at the very beautiful poplins and cloths of Irish manufacture. The zephyr friezes shewn by Luke Dillon indicate what Ireland can do if she likes, and if she would only cease from profitless agitation. Behind these cloth booths runs a long space occupied with agricultural implements, many of them more ingenious than useful in good husbandry. Highly-polished ploughs and wagons, made as if for drawing-rooms, cannot be spoken of with any degree of patience. Leaving these, however, to the 'agricultural mind,' we mount to the gallery above. Here, at a point over the cloth stalls, and with huge Turkey carpets suspended like flags, we find ourselves landed amidst a series of magnificent cases, formed of polished mahogany and plate-glass, and containing jewellery and plate to the value of hundreds of thousands of pounds. The gorgeous magnificence of some of these costly articles, particularly the desert services and epergnes, gives one a profound notion of the wealth of England, and the pitch of luxury at which it has arrived. Nor is the taste for such things confined to the metropolis: Birmingham, Exeter, Bristol, Liverpool, Newcastle, Dublin, Edinburgh, and other towns, strain for pre-eminence. The Dublin jewellery, embellished with pearls and other gems, copied from the antique ornaments of Tara, will be viewed with no small interest by the Irish archaeologist. In wandering amidst these groves of gold and silver, as in visiting other quarters where the spirit of ornamentation has been at work, the reflection suggests itself that the decorative principle may be carried beyond reasonable bounds. One can perhaps excuse a profusion of ornament in silver fancy articles for the table, but he will have less toleration for bedsteads groaning under the weight of gold, enamel, embroidery, and tassels—beds which are clearly made to be looked at, not to be slept in. In one of the galleries, a huge bedstead of this kind, by Faudel and Phillips, invites the observation of the curious. The cost of the article, we are told, is upwards of fifteen hundred pounds—a prodigious misexpenditure of money—the only redeeming point being that the decorations embrace two pieces of needlework of extraordinary merit. Of several sideboards the same remark as to heavy and overdone ornament may be made; and we would once for all try to put the fabricators of articles for domestic use on their guard against sacrificing simplicity and neatness to the unsound spirit of extreme decoration which seems to be abroad.

It is felt as a kind of relief to pass from the jewellery to the horological department, where the plain and substantial workmanship of English watches and clocks brings us back to the integrity of the national character. Next to these are large varieties of firearms and military equipments, likewise of matchless excellence, and good taste. A prodigiously large organ, from which an amateur is bringing forth a flood of harmony, fills up the western extremity. This monster instrument contains nearly 4500 pipes, some of them as high as an ordinary house. Down the north side of the nave from this point, we have on the galleries a rich assemblage of philosophical instruments—such as microscopes, sextants, telescopes, spectacles, theodolites, and magic lanterns; and next a variety of musical instruments, of tasteful construction and fine finish. Among these we recognise the handsome cottage piano made by Collard and Collard, at a moderate price, 'for the people.'

Lastly, in this section are a great number of stands covered with crystal and pottery. In no departments of art has England made such remarkable progress within the last sixty years as in glass and porcelain; and here, therefore, the visitor should make a critical inspection. He will be delighted with specimens of Kidd's process of ornamenting mirrors, by which the effect of flower-painting is given beneath the borders of the glass; with the richly-cut decanters, dessert dishes, vases, candelabra, and other articles. A cut-glass lustre of huge size, adapted for holding twelve dozens of candles, oppresses with its elaborate magnificence. Near this last-mentioned object are the porcelain wares of Minton, Copeland, and other potters of Staffordshire. Copeland has two vases of delicate workmanship, approaching to the quality of foreign products of this class; but these we less admire than the statuary of pure porcelain after the best sculptors. Could this class of articles be sold at a moderate price, their dissemination would materially extend a taste for the fine arts. Adjoining hangs a large carpet of Berlin wool, executed by one hundred and fifty ladies of Great Britain—each doing a portion, and the whole sewed into one piece. This elegant carpet was presented to Her Majesty, and bears the initials of the fair executants. The pattern is floral and heraldic in design, but we are not impressed with its elegance. The truth is, that among the carpets in the Exhibition, few are of that quiet character that proves most pleasing to the eye when laid on a floor. We are sorry to say, that recent adaptations in the manufacture of carpets have been making matters worse instead of better. A good carpet, free of vulgarities, is still a desideratum.

Descending to the ground-floor of this northern aisle, and starting at the northern extremity, we travel through one of the most important sections of the Exhibition. First, there is a large collection of carriages, principally by metropolitan exhibitors. Among these, however, we mark nothing new except a carriage from which the top lifts off, leaving the lower portion an open *calèche*; and a carriage with a couch for invalids—this last an ingenious and useful invention. Among the carriages is an omnibus from Glasgow, very superior in point of lightness and spaciousness to those confined machines now in use in London. This Glasgow omnibus accommodates nineteen passengers inside, with abundant ventilation. Adjoining the carriage department is the large section for machines, at rest and in motion, any account of which would be quite hopeless in this brief sketch: it can only be repeated that here lies England's greatness. But stepping aside to the kindred section of metallic ores and other raw substances, we have a key to the success which has rewarded the enterprise of mechanics. Some of the masses of materials are of vast dimensions. A block of coal, from the mines of Staveley in Derbyshire, measures 17 feet 6 inches long, 6 feet wide, and 1 foot thick, and was raised from a shaft 459 feet deep. Another specimen of coal is a block which measures 18 feet in circumference, and weighs 5 tons. One wonders how it got to the surface, and reached its present situation in safety. Cairngorm stones, Easdale slates, Caithness pavement, curling-stones from Ailsa Craig, and granite from Aberdeen, are among the Scottish articles in this department, with which may be ranked a large garden-seat resembling black marble, but consisting really of polished parrot-coal from the Wemyss Collieries in Fife, and made, as we are told, by a working-mason—a most creditable work of art. Of iron and other ores there are many specimens; also masses of copper—one being of great size from Cwmwall. The specimens of lead-ores and associated minerals from Allenheads, in Northumberland, will command attention in connection with the published account of the method of working and preparation. A cake of silver produced in the process of smelting these lead-

ores, and weighing 8000 ounces, is shewn in one of the cases. The sections which follow in going eastward are those exhibiting manufactures in leather, wood, marbles, and paper, with some other articles, including letterpress printing, bookbinding, waxwork, printing in oil-colours, drawing, engraving, and other-arts. The visitor will here admire the inlaid stone-tables from Derbyshire, the obelisks of serpentine from Penzance, and the fine carved vases in yellowish stone from Malta. Behind the tastefully-laid-out stand of De la Rue & Company will be found ensconced a variety of specimens of binding—some plain and good, others rather gaudy, and some overdone with ornament—not for human handling. The binding of one of these volumes, we were informed, cost £30. Perhaps the proprietor of this costly affair is of opinion with that ancient Scottish member of the craft who declared, that 'onybody could write a book, but the bindin' was the thing!'

But we must leave the quarter of literature and fine arts, where one could spend days in admiring, and will merely recall to remembrance those exquisite little figures in wax, illustrative of Mexican town and savage life, modelled by Montanari, an artist resident in London. The last department in line, before crossing the transept to the foreign section, is that devoted to India, from the rudest to the richest products, with models of sundry processes of hand-labour. Much care has been bestowed in presenting as complete a collection as possible of Indian manufactures; and we see in many of these the germ, as it were, of those arts which, by the aid of capital and machinery, have attained such magnitude in modern Europe. The rude and tiny apparatus for weaving which dangles from the boughs of a tree, will be compared with the power-loom of recent invention. The process of two women grinding at the mill, will not only recall a passage in Scripture, but mark the vast stride which has been made in the industrial arts.

Here, on arriving at the lofty transept, with its murmuring fountains, its gay parterres of flowers, its leafy green trees, and its snow-white marble statues, we cross to the eastern section, occupied by the stands of foreign nations. At a glance, we observe that we are amidst a new style of things. Visitors who have carefully noted the peculiarities of the foreign products, will recollect the rich embroideries in gold from Tunis, the tasteful combinations of which transcend anything that could be effected by European art; but Tunis, as is well known, is renowned for this species of work, and executes orders for all parts of the East. An embroidered velvet saddle-cloth, shewn among the articles from India, is probably from Tunis. Turkey, China, Greece, send also some articles of a highly-fanciful kind; but the visitor is more occupied with the artistic products of Spain, Tuscany, and Rome.

From these countries have been sent a variety of tables in mosaic, formed only by years of labour. Tuscany may be said to bear off the palm in this class of articles; but let us be just towards Rome, which sends a round table of mosaic, the work of Barberi, which cost the labour of six years, and is valued at £1500—cheap, it may be, at the money; but who is to buy objects at such prices? France, as is her right, occupies considerable space below and overhead. Her jewellery, carpets, paper-hangings, and bronzes, are of course very fine; and in cabinets, and other articles for domestic use, she clearly carries the day against England. A bookcase in ebony and bronze, and a sideboard in carved oak, which flank the entrance to the department of Serres china and Gobelins tapestry, are, we should think, the perfection of art. The vases and other grand porcelain from Sevres, and also the tapestries from the Gobelins, are of a high order; but being made by public money, and not as a matter of ordinary trade, it would be unfair to draw any comparison between them and the articles produced by private enterprise. Russia shews vases equally magnificent; they,

likewise, are from national factories, and doubtless by the hands of imported French artisans. Austria contributes many beautiful and useful articles from her German and Italian dominions; and we need only recall the spacious suite of princely apartments, at the entrance of which stands the massive candelabra of coloured glass from Bohemia.

Belgium makes a most manful exhibition of elegant furniture, cutlery, machinery, lace, and well-selected miscellaneous goods. At every turn, however, we see that France presents the best taste in the art of laying out her wares. The French stands of wood and glass may be less costly than the English, but they excel in general effect. Another thing will not pass unheeded; few of the English stands have any attendants; all the French ones are waited on by natives, mostly females. There, precisely as we see them within the shop-windows of Paris, are seated the patient wives of 'messieurs les exposants,' busy with their knitting needles or newspaper, ready to answer questions, and to hand a neatly-printed card to the visitor; while messieurs themselves, according to immemorial usage, lounge about in twos and threes, in the performance of no small quantity of work by head, tongue, and shoulders. As might have been expected, the United States come out much stronger in bread stuffs and other raw materials than in manufactures. They contribute only three kinds of articles worth noticing—Colt's revolvers, a deadly species of pistol; carriage harness; and ladies' dress-shoes. One set of harness, with mountings in solid silver, from Philadelphia, is said to have cost 3200 dollars—a great waste of money. On the whole, the United States come out feebly in the arts, and occupy about double the space which they require. The marvellously fine statue, in pure white marble, of a Greek female slave, by Hiram Power, is the only redeeming feature in the American department; and it is contributed by a resident in London.

Such is a mere glance at this extraordinary collection of industrial products, the individual curiosities of which would require a lengthened report. It may be safely averred that, taken as a whole, the Exhibition goes considerably beyond the expectations formed of it. Always practical and looking to the main chance, Englishmen have asked what is to be the use of it all—is it to do any good to trade? Now, it occurs to us that if the thing be gratifying in itself, and have a tendency to improve mechanical knowledge and artistic taste, a sufficiently important object will be served; but surely the bringing together of people from all quarters of the world on a mission of mutual friendship, each shewing to his neighbour what he can do in the arts of peace, is worth all the trouble and expense that have been incurred. There are, it is to be regretted, parties who imagine that England can maintain her supremacy only by keeping herself to herself—a doctrine totally opposed to those generous feelings which distinguish her people; and it may be asked, has such generosity not been rewarded in a manner beyond precedent in ancient or modern times? For centuries have mankind been called to perform the Christian duty of loving one another. Well here, in a common-sense, business-like way, the thing is exemplified. Who grudges the Frenchman the exhibition of his elegant little articles?—who is afraid that the foreigner from distant lands, who is permitted to shew his handicraft in this chosen shrine of industry, will rob us of our daily bread? Away with all such bigotries; most unworthy they are of the soil which gives them birth!

To whoever may belong the merit of suggesting this novel congress of universal art and industry, there can be but one opinion as to whose ingenuity we are indebted for its achievement. We allude to Mr Paxton's happily-conceived idea of a palace of glass and iron, without which, in our humble belief, no Exhibition, at least in 1851, could have taken place; for the

monstrous failure of the palace of legislation at Westminster, not to speak of other blunders in the palace-building line, leaves no reasonable doubt on the mind, that if the scheme of rearing a fabric of brick and mortar had been attempted, it would have proved to be a humiliating and expensive botch. To Joseph Paxton, therefore, he ascribed the glory of this marvellous achievement! Now that the thing is done, the wonder will of course cease; but it is not un instructive to recall the pedantic fears of the wise and prudent with the actual result. The fabric was to be shaken down by the wind; its galleries were to be incapable of supporting the pressure of a moving crowd; its fragile roof was to be battered in by hailstones. The whole of these distressing apprehensions have proved to be visionary; and we are glad of it, if only to give a check to croaking. The happy effect of Mr Owen Jones's colouring and general embellishment—much opposed at the outset—form an additional subject of gratulation. In having carried out the whole affair to a practical issue, the royal commissioners deserve the most eminent commendation. The Crystal Palace is one of the grandest triumphs of skill—a thing for mankind to be proud of—a temple of art worthy of a great sovereign and a great people!

GOLD WORSHIPPERS.

It is curious to look back on the fatal and universal prevalence of Gold Worship recorded in the history of our race, from the period when Midas became its victim, and the boy chased the rainbow to find the pot of treasure at its foot, to the days when the alchemist offered his all a burnt-sacrifice on the altar; until we reach the present time, when, although the manner of its worship has changed, the old idolatry remains in spirit the same. One or two anecdotes illustrative of the passion for gold worship may not prove uninteresting.

The hero of our first story—a chamois hunter of the Swiss Alps—was for many years of his existence an absolute stranger to the very sight of gold. He dwelt in a mountain *chalet*, in the peaceful contentment and ignorant simplicity of former ages—lord of his own freedom, with nature for his domain, and the fleet Alpine creatures for his subjects. By some unfortunate chance, however, he moved from this dwelling of his youth to the lower station, and to the side of a pass frequented by travellers, towards whom he was frequently called on to exercise hospitality. His services, and the shelter he afforded, were occasionally rewarded with gold, which, though of little actual use or value to him as a circulating medium, gradually exercised a strange fascination over his senses. He hoarded his guineas with the doting fondness of the miser; he looked on them with more pleasure than on the faces of his children; and listened to their chink with a satisfaction no tone of household love or sweet Alpine melody could call forth. It chanced one day that our hunter, in the pursuit of his ordinary avocation, perceived a tiny cavern hitherto unknown to him. He determined to snatch his hasty noontide meal beneath its shelter; and in order to enter it, rolled away a block of stone which obstructed the mouth of the fissure. To his amazement, its removal presented to his gaze a deep hole, in which a vase of considerable size was buried. He removed the lid, and there, fresh and bright, as if they were coins of yesterday, glittered before his eyes a multitude of golden pieces, mingled with shining particles of ore. A buried treasure of long past ages was before him. He took them in his hands, he clutched them, he stared at them with half-insane delight. He could not, of course, divine how they had come to be in their strange hiding-place, or who had placed them

there; the inscriptions on them—the figure of a lamb, which some few bore—said nothing to him. There appeared to be something supernatural in the discovery, and he wasted all the remaining hours of daylight beside the vase; then, as night closed in, he replaced both the lid and the stone above the treasure. He did not attempt to remove it to his own dwelling, nor did he breathe a word of his discovery even to his wife; but from that hour he became an altered man.

The love of gold is an absorbing passion, especially when thus embodied and materialised. He lived only beside his treasure; thither he bent his steps daily, nor left it till the gloom of evening hid the object of his idolatry from his eager gaze. His hunter's craft was neglected; his family pined for food; he himself grew gaunt and thin, anxious and suspicious; ever dreading that his secret might be discovered; restless and miserable except when beside his wealth, where want, and hunger, and the sad, suffering faces of those he had once loved, were all forgotten. Only when the gathering darkness drove him from his hoard did he think of using his fowlingpiece, and scanty was the provision thus obtained. In order fully and perfectly to contemplate his gold, it was necessary for him to stretch himself at full length before the entrance to the little hollow; his head and shoulders to the waist being thus within the cave, immediately over the vase, his body and legs outside. The cliff above the opening was nearly perpendicular, and had been much split and shaken by the frosts since an avalanche had deprived it of its crown of snow; but of this danger he was heedless or unconscious. One morning whilst lying prone, repeating for the fiftieth time his daily counting of the old coins, a portion of the rock detached itself slowly, and falling on his waist, pinned him to the earth, without however crushing or greatly injuring him. He uttered a loud cry, and made desperate exertions to raise it and free himself, but in vain; a fate beyond his strength to resist had fixed him to the spot of his unhallowed and insane devotion. Imagination can scarcely conceive a more fearful death than the slow lingering one of bodily torture and starvation that must have followed. He was of course sought for as soon as missed; but the spot was unknown even to the most practised hunters, and it was more than a week before the body was discovered. The surprise and horror of his family may be imagined. They had never been able to comprehend his altered conduct and mysterious disappearances: all was explained, however, when the huge stone being removed, he was found—perhaps from his position involuntarily—clutching in his dead fingers the fatal gold.

We relate this incident on the authority of a Swiss lady who had seen the cave, and who asserted as that the simple mountaineers avoid the spot with superstitious horror. To them there must have appeared to be some strange magic in the hidden treasure; and so to the calmest judgment it would seem, when in the ordinary course of life we behold, not only the fearful and painful sacrifices made for the attainment of gold, but the court paid, the homage offered to its possessors by those who have no hope of gaining anything by their reverence for the mere name of wealth.

To come nearer home, our village at one time rejoiced in a gold worshipper, whose history is worth relating. While still young, and taking our daily walk with our nurse, we observed an old man working at the repairs of some miserably dismantled house. He was a tall, gaunt personage, painfully meagre, and very ragged. His jawbones protruded distressingly; and his poor thin elbows looked so sharp, that one could have fancied they had cut their way through the torn coat that no longer covered them. We pitied, and with childlike sympathy and freedom made acquaintance with him; always pausing to speak to him when we passed the spot on which he

laboured. Sometimes a little boy, a fair delicate child, was with him, assisting in the work as far as his age allowed; and with this young creature we grew intimate, and were at length led by him to the old man's home. It was a very large, old-fashioned farmhouse, but so much out of repair that only three or four rooms were habitable. These, however, were kept in exquisite order by the wife, who was a very pretty, and-looking woman, many years younger than her husband. By her care the antique furniture, which must have counted its century at least, was preserved brightly polished; the floors were so clean, that the lack of carpeting was scarcely perceptible; and the luxuriant jessamine she had trained round the windows was a charming substitute for curtains. There was one peculiarity about the dwelling, of a striking kind when its apparent poverty and the character of its owner were considered: it contained a music-room! in which was a tolerably large church-organ, *made and used* by the miser himself. To the debasing and usually absorbing passion which governed him, he united a wonderful taste and genius for music, to gratify which he had constructed himself the instrument we have named, on which we have heard him perform in a style of touching, and at times sublime, expression, the compositions of Purcell, Pergolesi, Handel, &c. We have always thought this love of harmony in a miser a more singular and inconsistent characteristic than the avarice of Perigino or Rembrandt, since in their case the art they practised fed their reigning passion for gold; nevertheless so it was—old Mr Monckton would go without a meal, see his wife and family want common necessities, with plenty of money at his command, and yet solace himself by performances on the organ, which frequently went far into the night, startling the passing stranger by bursts of solemn midnight melody; for he never played till the faded daylight rendered it impossible for him to work at the various little jobs by which he added to his hoards.

He had two sons: the pretty child we first knew, and an elder one, a slim, delicate youth, who was by nature an artist. His father's parsimony rendered it, however, a difficult matter for him to procure materials for the exercise of his art, which was wholly self-taught; and it was wonderful to witness the effect he could produce from a bit of common lamp-black, or an ordinary drawing-pencil. His genius at last found aid in the loving heart of his mother, who secretly and at night—often whilst her strange husband filled the house with solemn music—worked at her needle to procure the means of purchasing paints, canvas, brushes, &c. for her boy; toiling secretly, for if she had permitted the father to know that she possessed even a few shillings, he would have extorted them from her. It was all she could do to help the young painter in his eager self-teaching; for she possessed no other knowledge than that acquired at a village school during her childhood. Her own fate had been a very sad one. She was a labourer's daughter, betrothed from early girlhood to a sailor, who was her cousin; but during one of his voyages—the last he was to make before their marriage—her beauty attracted the admiration of the rich Mr Monckton, and he offered to make her his wife. The poor girl would fain have refused him, and kept her promise to her absent lover, but her family were flattered and dazzled by the idea of her wedding a man known to be so wealthy, and she was not proof against their entreaties and their anger. She married him; her relatives, however, derived no benefit from the match their selfishness had made. The miser's doors were closed against them; and lest his wife should be tempted to assist their poverty at his expense, he forbade her ever seeing her parents. A weary lot had been poor Mary's from that hour she married. Her only comfort was derived from her children; and even they became a source of sorrow as they

grew past infancy, and she found that her husband's avarice would deny them even the advantages she had enjoyed as a poor cottage child. They received no education but such as she could give them; nay, were made to toil at the lowest drudgery in return for the scanty food and clothing their father bestowed. She taught them to read and write; and afterwards Richard, the elder, became his own instructor. There were many old books to be found in the farmhouse, and of those he made himself master. The villagers, who had a few volumes, were willing to lend them to such a clever lad; and at length, as we have said, his genius for painting developed itself, and was ministered to by his mother's industry. We remember seeing his first attempt at original composition. It was boldly conceived and well executed, considering the difficulties under which he laboured: the subject was Phæton driving the chariot of the sun. It was shewn to the clergyman of the village, a man of great taste, and a connoisseur in painting. He was so much pleased with it that he became the warm friend of the young artist, and, as far as circumstances permitted, his instructor in literature and painting. The younger brother inherited his father's taste for music, and was a quiet, thoughtful child, passionately attached to Richard, on whom he looked as a prodigy of learning and talent. Nothing, in fact, could be more touching than the attachment of these two brothers: at their leisure hours they were always to be seen together: their pleasures or sorrows were mutual. The privations, injustice, and restraint to which they were subjected appeared to bind them to each other with a love 'passing the love of woman'; and both found consolation in the mental gifts mercifully imparted to them.

About four years after we first became acquainted with the Moncktons, the fair, gentle child, then nearly fourteen, became ill; growing thin, pale, and weak, till his mother and Richard, in great alarm, besought old Monckton to let him have medical advice. The request produced a storm of passionate reproaches. 'The boy,' he said, 'was well enough. He ate as much as was good for him. Did they think people could not live without gormandising as they did? Did they imagine he should throw away his little means upon doctors, who were all a set of cheats? He should do nothing of the kind!' And poor Ernest was left to pine and wither, till Richard in despair sought out a physician, and telling him their story, besought him to come and see his brother, promising to repay the advice he asked by his future toil.

Dr N—— was a kind-hearted, benevolent man. He at once complied with the youth's entreaty, and called at an hour when the old man was absent at the farm. He found his patient worse than the brother's report had led him to believe. The illness was decline, caused probably by want of sufficiently nourishing food at a period of rapid growth, and increased by the overworking of a mind that was ever craving after knowledge. He prescribed such remedies as he judged best; but informed the mother, at the same time, that strengthening food was of the first importance, and would be the best means to effect a cure. Alas! how was it to be obtained? The heart of the miser was impenetrable to their remonstrances and entreaties—what was life in his eyes compared with gold? When they found that no human sympathy could be expected from the father, the mother and brother determined to use their own exertions to obey the behest of the physician. Early and late the former worked at her needle—the good doctor finding her as much employment as he could; whilst Richard, abandoning the study of his art, painted valentines, card-racks, and fancy articles for the stationers, and sought eagerly for every opportunity of winning a few shillings, to be spent in ministering to the comfort of the beloved sufferer. But it was all too late: Ernest sank slowly, but surely.

There were intervals when life, like the flicker of an expiring lamp, appeared successfully struggling with death; but these occasional brightenings were always succeeded by a more entire prostration and languor. The personal beauty, for which Ernest had always been remarkable, grew almost superhuman during his illness, and Richard could not resist stealing a little time from his busy labours to paint his brother's portrait. In the execution of this task of love, however, many hinderances occurred; and before it was more than a sketch, the dear original had passed away from them in one of those quiet sleeps which, in such cases, are the usual harbingers of death. The painting was removed to Richard's chamber, and in the first agony of his grief, forgotten; but when Ernest had been committed to the grave, and life had assumed its usual monotony—more gloomy now than ever—he remembered his attempt, and resolved on finishing the likeness from memory. An easy task! for nightly, in his slumbers, he saw the fair, sweet face of his young brother. The second morning after he had resumed his pencil, he was startled at finding that the painting appeared to be in a more advanced state than he had left it the night before; but he fancied imagination must be juggling him, and that he really had done more than he remembered. The following day, however, the same phenomenon startled him, and he mentioned the circumstance to his mother. She was superstitious, and nervous from sorrow and regret; and she at once adopted the fanciful notion that there was something supernatural in the matter; suggesting the possibility of their dear Ernest's gentle spirit having thus endeavoured to shew them, that in another world he still thought of them and loved them. Richard combated the idea by every argument his reason offered him; but as he was convinced of the fact, and could give no satisfactory explanation of it, he was at last persuaded by her earnest entreaties to leave the picture untouched for two or three days, and see what consequences would follow. The painting progressed! daily, or rather nightly, it advanced towards completion. Every morning a stronger likeness of the dead smiled on them from the canvas, and a more skilful hand than the young painter's appeared to be engaged on the work. It was a marvel past their simple comprehension; but the mother, confirmed in her first belief, resolved to watch, and try if it might be permitted to her living eyes to gaze again upon the child whom the grave had shut from her sight. With this hope she concealed herself, without Richard's knowledge, in a large closet in his bedroom—placing the door ajar that she might see all that passed in the chamber. Her watch was of no long duration; suddenly her sleeping son rose from his couch, lighted his candle, approached his easel, and began to work at the portrait! Much amazed, and half angry at the deception she believed he had practised on her, Mrs Monckton issued from her hiding-place and spoke to him. He made her no answer; she stood before him—he saw her not; he was fast asleep! It was indeed a spirit's painting; for love had in this instance burst the bands of matter, and the somnambulist had achieved a work of art that surpassed all the efforts of his waking hours.

The story of the sleep-painting got abroad, and reached the ears of a gentleman of large fortune, who resided in the neighbourhood. He called on the young artist; was pleased with his manners; and proposed engaging him as travelling companion to his own son, a youth about to visit Italy with his tutor; proffering a salary that would enable him to cultivate his genius for painting in the land of its birth, and of its perfect maturity. The offer was eagerly and thankfully accepted, and old Monckton made no opposition to his son's wish: he was only too thankful to be relieved from the burden of supporting him. Indeed the miser was somewhat changed since Ernest's death; not that

he expressed in words any remorse for having preferred his gold to the life of his fair young son; but from that time he never touched the organ—the spirit of music appeared to have died with Ernest; and he often visibly shrank from meeting the silent reproach of Richard's eyes. The neighbours also shunned him; they had loved poor Ernest, and the conduct of his father towards him—the fact of his refusing to pay the physician who had attended him, 'because he never sent for him'—and the mean, pauper-like funeral which he had grudgingly bestowed on the dead—revolting and disgusted them. A mean funeral was one of the offences the people of K— never forgave! The old man probably detected something of their feelings in their manners, for he gradually gave up his ordinary work about the village—that is, the keeping in repair such cottages as belonged to him—and remained much within doors. This change of habits and want of exercise told fatally on threescore and ten; and probably hastened his death, which took place two years after his son's. He died without a will, but left very considerable property. It was supposed he died intestate, either because he grudged the expense of making a will, or because he could not endure the thought of parting from the gold which had had the worship and the service of his life. Richard, on his return, repaired the old farmhouse, and restored it to something like comfort. He proved liberal, but not (as is frequently the case in such instances) lavish. The only piece of extravagance of which he was ever accused—and it was the village stone-mason who blamed him for that—being the procuring an elegant marble monument from Italy, the work of a first-rate sculptor, to place over the grave of his beloved brother. The figures on it were—an admirable likeness of Ernest, taken from the somnambulist's picture, and two angelic beings in the act of presenting the risen spirit with the palms and crown of victory gained over sorrow, suffering, and death. The inscription on the tomb had an awful and touching meaning to those who knew the story of the brothers' life; and we know not how we can better conclude our sketches of the insane folly of gold worship, than by finishing them with these solemn words—'Lay up for yourselves treasure in heaven.'

INDIAN HANDICRAFTS.

THE contrast between the civilisation of the East, and that of the more advanced states of Western Europe, is shewn in nothing more markedly than by the different modes in which the most ordinary handicrafts are conducted. The real progress of a race does not depend so much on the perfection of the abstract sciences, on poetry, music, or painting, as on the extent and perfection of those simple arts which minister to the daily wants and comforts of life. Whatever apparent progress may have been made without a corresponding improvement in these arts, has been fleeting and unreal, and has eventually sunk beneath the waves of time, leaving little but a name behind. Sometimes a warlike race may have risen to a pitch of fictitious refinement by appropriating the industry of others; but in as far as they did so without improving the industrial arts, they merely transferred to their own use a larger share of the common stock, and could only advance themselves by degrading others. I do not mean that the cultivation of science and the fine arts is not attendant upon a high state of civilisation, but that these are the *results*, not the *causes*, of a liberal supply of the first necessities of life.

Seen from this point of view, a comparison between the English handicraftsmen and those of Hindoostan is capable of throwing into strong relief many of those

inborn peculiarities which distinguish their respective races.

During a residence of some years in a part of India little frequented by Europeans, I had, from my practice as an engineer, ample opportunities of studying the essential character of Oriental handicraft, and propose giving the reader a short sketch of my experience in this interesting department. The first, and, in the eyes of an Englishman, the most offensive peculiarity of the Indian workman, is his habit of always squatting while at work. Blacksmiths, carpenters, masons, &c. all work with their knees nearly on a level with their chin; the left hand—when not used as the kangaroo uses his tail, to form a tripod—grasps the left knee, and binds the trunk to the doubled limbs. The whole posture is so suggestive of indolence and inefficiency, that an Englishman—particularly if he stand in the relationship of paymaster and employer—requires great self-control to look at it with any degree of patience.

On my first arrival in the country, having to superintend the erection of a large plant of English machinery, I set about organising a *kharkhanna*, or workshop; and my first arrangement, after procuring the requisite number of workmen, was to fit up benches for the carpenters, and forges for the blacksmiths, &c. Of course, while these were being fitted up, I was prepared to submit to the old system of squatting, and consoled myself with the reflection, that I should soon be able to convince the natives how much more rapid and effective was the English method of standing while at work. But in this, as in many other attempts at improvement, I was doomed to undergo a signal defeat. In order to prevent the blacksmiths from sitting while at work, I had the anvils raised upon wooden blocks, so as to necessitate an erect posture while at work. The poor fellows submitted with the best grace they could, but seemed greatly embarrassed by the novelty of the arrangement. The queer shaky way in which they stood, and the undecided flexure of the knee and hip-joints, were so indicative of a tendency to flap down on the slightest possible pretence, that it was really impossible to look at them without laughing. The work went on very slowly; but I hoped that, as they became accustomed to the attitude, they would feel the advantage of it, and then all would go well; but, alas! I had underestimated the tenacity of a race-established precedent; and so, one afternoon, I found my blacksmiths perched on blocks of wood of the same height as their anvils, and hammering away with all the vigour which the stability of their tottering pedestals admitted of! It was hopeless contending with such a demonstration as this; so, to the great joy of the *balais* (blacksmiths), I allowed the anvils to be placed once more on terra firma.

I have no doubt that in this instance the failure mainly arose from a deficiency of muscular power in the lower limbs, although the fact of their not using chairs, or other seats for ordinary use, must have had much to do with it. It would seem as if chairs or raised seats were one of those natural steps towards a higher civilisation, the value of which we are apt to overlook until we begin to trace the consequences which the want of such appliances gives rise to. It would be interesting to speculate on the revolution which a sudden deprivation of our chairs and tables would give rise to in our social and moral characteristics.

In this shoe-wearing part of the world we are apt to regard our feet merely as organs of progression; but the Indian turns his to a variety of purposes which we are accustomed to regard as fitted only for hands. The *balai*, when he has got a piece of iron to file, fixes it between the jaws of a pair of small tongs, and grasping the tongs between the great toes of both feet, he holds it so firmly, that he is able to exert the whole strength of his arms in using the file. There is

something very quadrumanous in his appearance while so employed; more particularly if, as occasionally happens, to save himself the trouble of shifting his position he stretches out one of his legs, and with his toes picks up some article which happens to lie beyond the range of his arms. Whether from habit or original conformation, they possess a singular degree of muscular power in their toes. The great toe is generally separated from the others by a wider interval than I have ever seen in the feet of Europeans. So marked is this peculiarity in some workmen, that, combined with the prehensile faculty alluded to, and the custom which many have of adorning it with a gold or silver ring, it really seems to have assumed all the functions of a thumb.

Time, which the Englishman values as money, has a very secondary place in the estimation of the Oriental; and all his tools and methods of working seem to be contrived with the view of consuming as much of that valuable commodity as possible.

The *radj*, or bricklayer, is, I think, about the best illustration of this. He works with a trowel about the size of an ordinary tablespoon, and a small hammer weighing about six ounces. Armed with these, and squatting before his work, he, in a loud voice, summons his *rundees* (women, two of whom always wait upon each *radj*), and orders them to bring *centee* and *massala* (bricks and mortar.) The *rundees* in due season make their appearance—one with a brick in each hand, and the other with a small wooden trencher, about the size of a bread-basket, filled with the *massala*. Without changing his position, he empties the trencher on the extended bed of the brick, and it seldom contains more than enough for two bricks. He now spreads the mortar evenly with his trowel, assisting the process by adding water from a small earthenware pitcher, handed to him by an attendant *rundee*; and as the bricks are often very irregular in shape, he has three or four minutes to spend in chipping off the irregularities with his hammer; and if he be at all fastidious, or the brick unusually bad, he will spend twice as much time as this. It is at this part of the process that the patience of an Englishman generally gives way; and with an impatient *his wasty* (what for), addressed to the apathetic *radj*, he gives vent to his feelings in a string of English adjectives, addressed to no one in particular. I once heard an energetic indigo-planter declare, that he would at any time walk a mile in the hottest sunshine, rather than be condemned to contemplate the proceedings of the masons at work on his own factory. After the *radj* has got the brick laid down, there is a complicated process to go through with a string and a ball of stone. The string is provided with a small slip of hoop-iron, in length exactly equal to the diameter of the ball, and made to slip up and down the string by a small hole pierced in its centre. In order to insure the perpendicular line of the wall, he applies the end of the slip of iron to the side of the brick last laid, and allows the ball to hang at some distance below; and as by means of the slip of iron at the top the string is held from the brick at the distance of the radius of the ball, if the brick be properly placed, the plummet-stone will just touch the wall below. It was all in vain that I made a straight-edge and plumb-line in the English fashion, and shewed them that by using it they would save themselves the trouble of testing the position of each brick as it was laid. So long as I stood beside them they pretended to use it; but the moment my back was turned, out came the time-honoured plummet, that had assisted in building the oldest temples in Hindoostan, and was certainly quite good enough for anything a *feringhee* like me could require.

I am much within the mark when I say, that a single English bricklayer and hodman could in one day do the work of a dozen *radjs*, *rundees*, and all; and do it much better too. One would imagine from this that

building was a very expensive process in India; but the contrary is the case. An English bricklayer and hodman will cost from eight to ten shillings a day, while the Indian *radj* and his two attendant rundeels will not cost more than from threepence to fourpence per day.

From having smaller hands and less physical strength than Englishmen, the Indian workman feels great difficulty in using English implements, unless of the smallest size. I had an amusing illustration of this on one occasion, when having to run up an embankment with rather more expedition than usual, I made an attempt to substitute wheelbarrows for the native system of transporting earth by what is called *cowrie kep*. This consists in employing a number of women and children with wicker-baskets, capable of holding about a spadeful each; a number of men with spades fill these baskets from the spot where the earth is to be removed; and a *peon*, or overseer, stationed where the earth is to be laid down, gives each woman and child, as she delivers her basketful, a *cowrie shell*—in value equal to about the eightieth part of a farthing! This method of transporting earth short distances is very cheap, but it is also very tedious; so I got the carpenters to make me a number of wheelbarrows, after our English model, and by way of encouragement I wheeled the first barrowful of earth myself; then turning to one of the stoutest of the men, who were grinning at the new machine, I invited him to follow my example; but the poor fellow, after staggering along for a few paces, and making the most hideous contortions as he attempted to steady himself, fairly tumbled over, barrow and all. The barrow was only half filled next time; and after a great deal of see-sawing, he managed to deliver his freight. Thinking that a little practice, unembarrassed by my presence, would familiarise them with the barrow, I left them for a short time to attend to some other business; and on my return I beheld the wheelbarrow borne along by four men, very much in the style in which dead men are carried off the stage—that is, two at the head, and two at the feet!

As I attributed this failure to my having made the barrows too large and too heavy, I had a set of lighter ones made—little larger than those with which boys are accustomed to amuse themselves in England, but capable of holding more earth than the baskets. My success for a time was complete; and the idea of ever catching four men engaged in the conveyance of so tiny a vehicle was out of the question. The natives, too, seemed to like them, and trundled their barrows with great glee; the work, too, appeared to go on rapidly. After a short time, however, I observed that the quantity of earth excavated each day in no case exceeded that which could have been done with the baskets, and was frequently much less. I was much puzzled at this, until one day, happening to come upon them unexpectedly, I received a most satisfactory explanation of the enigma. There were half-a-dozen of the men walking along with the greatest possible gravity, each carrying his wheelbarrow on his head—the legs in front, and the wheels behind!

After a great deal of coaxing and careful watching, I did at length succeed in establishing the legitimate use of the barrow; but even after I had threatened to dismiss the first man I found carrying his wheelbarrow on his head, I met a serious-looking old man tottering along with his barrow laid across his arms like a baby in long clothes!

In the district in which I lived there had been vague, mystical stories afloat respecting a strange machine said to be possessed by the *sahib logues* (sahib people.) It was said to be capable of running ten *coss* (twenty miles) an hour, with a hundred wagons at its heels; and ships were said to be propelled by it on the *Kalla panee* (blackwater or sea) against both wind and tide. But these stories were considered by many

as far-away wonders, with which the *sahibs* delighted to magnify their own wisdom at the expense of the *Hindustanee admees* (men of Hindoostan.)

Great, therefore, was the astonishment of these wise men, when it was made known that one of the mysterious machines was about to make its appearance amongst them. Crowds of solemn-looking Brahmans, and grand-bearded Mussulmen, might be seen examining and criticising the limbs of the huge creature as they lay scattered about on the wharf, where they had been just landed. During the time these *dijecta membra* were being put together, there was much speculation and curiosity as to what means of energy these uncouth-looking fragments of iron could possess; and when I had occasion to consult the plans, before giving instructions to the workmen—applying a pair of dividers and scale, and sometimes making calculations with a piece of charcoal on the nearest wall—I observed that the men ceased working, and looked on with open mouths, as if I had been going through a conjuring process.

After much labour and anxiety, I at length succeeded in getting the *monster* put together; and one day, just as the heat of the day was beginning to decline, I ordered the boiler to be filled with water, and soon had a roaring fire beneath it. The natives seemed to have an impression that something unusual was about to happen, and crowds from all quarters began to assemble to witness the new *avatar*. By dusk the steam was well up; and by the light of two flaring *men-salches* (torches) I could see curious-looking faces peering in at all the doors and windows of the engine-house. The workmen who had assisted in its erection laid by their tools, and were whispering to each other in wondering groups, when the safety-valve suddenly opened, and the new-born Titan began to let his voice be heard. I shall never forget the terror and amazement depicted on the faces of those who were standing by me when this occurred. A great many ran away in sheer fright; but those who had been employed in putting the engine together had, from daily familiarity, grown bolder, and readily assisted in turning round the ponderously-wheeled preparatory to starting. It was as much as a dozen of them could do to move it, and that very slowly; but when the steam began to act, and the massive iron rim to steal away from their aiding hands, they fairly screamed with delight. Faster and faster went the wheel; the pumps clanked; the steam snorted through the escape-pipe; and the heavy masses of iron they had experienced so much difficulty in lifting into their places now seemed endowed with life and motion.

Some months after the engine had been at work, and when I had become better acquainted with the language, I was at much pains in endeavouring to explain the principles of its action to the most intelligent of the workmen; but I found they had long ago provided themselves with what, to their thinking, was a complete theory of the whole matter. The doctrine was, that the boiler contained an English *bhoot* (spirit); that we made a fire beneath the boiler, and roasted the said *bhoot* until he called out *dehagei* (mercy) through the safety-valve; and then only, and not before, would he go to work: the water was merely given to quench his thirst! The repeated injunctions given the man who attended to the boiler about the necessity of keeping it well supplied with water, and the consequences of the boiler bursting, which I attempted to describe as likely to follow any neglect of this precaution, led the poor fellow to imagine that if the *bhoot* was not *khoosh kurraed* (made pleasant) with plenty of water, he would certainly break loose, and kill everybody within his reach. They soon began, however, to have tolerably correct notions of its real character; and although no longer believing in its supernatural attributes, they allowed it was a *horra hicknut* (a great contrivance.)

Steamboats now ply between all the principal stations on the Ganges; and it presents a curious contrast to witness the straightforward course and inflexible will of the English steamers breasting wind and tide, as if impelled by fate, and the crazy, undecided motions of the native budgerows creeping along the lee-shores, tacking and tumbling about with the most bewildering uncertainty. Railways, too, are now in the course of construction on some of the principal lines of traffic; and the time is not far distant when, by their means, the rich produce of Central India will be poured into Europe with a profusion and regularity never yet dreamed of. Ay, the steam-engine is destined to do more for India than all her other teachers have yet effected. This iron apostle of civilisation does not declaim; it does not dispute nor vituperate; but it works, and always succeeds.

SPAGNOLETTO.

TOWARDS the end of the sixteenth century there lived at Xativa, a small town near Valencia, a captain named Ribera. He had fought for many years in the King of Spain's service, and now retired on a small pension, intending to devote the remainder of his days to the education of his two sons. Of these the eldest was of a wild and wayward disposition; inasmuch that, while yet a youth, he had run great excesses. Turning for comfort to his younger child Josef, the father, in order to bring him up in strict and sober habits, caused him to be clothed in a robe of black serge, and placed under the severe tuition of a learned doctor from Salamanca. The gloomy nature of his studies, the stern discipline of his teacher, and the constant restraint which he endured, made of Josef Ribera a dark, morose, and sullen boy; and no doubt, so potent are early impressions, determined the bent of his future character.

When he attained the age of fifteen, his father sent him to Valencia in order to complete his studies, and to select one of the three then fashionable learned professions—namely, theology, medicine, or astronomy. When the lad found himself, for the first time in his life, at liberty, and furnished with a tolerably well-filled purse, he began freely to enjoy the pleasures of society, from which he had hitherto been debarred, and speedily became acquainted with the painter Ribalta.

Francesco Ribalta had made a long sojourn in Italy, and to him and to his studies the Spanish school of painting owes chiefly its perfection. The sight of his works formed a new era in the life of young Ribera: from the day that he first set his foot in the artist's studio he renounced his learned pursuits, and completely devoted himself to the cultivation of art. During six months, without any guide but his natural genius, he passed his days, and a great portion of his nights, in reproducing the forms of familiar things; he spent sums of money in paying persons whom he met in the streets to sit to him as models; and, in short, soon found his pocket without a single maravedi. In this dilemma he addressed an eloquent letter to his father, declaring his firm resolution to become a painter, and requesting a supply of money for his immediate necessities. Captain Ribera was a firm and determined man. The same inflexible spirit which had caused him to leave his favourite son writhing beneath the rod of a stern tutor, now nerved him to resent this thwarting of his will; and he sent a cold reply, stating that he would not oppose his son's vocation, that he wished him all success in his new career, but that he could not afford to send him money, or at any time increase the small annual allowance which he had promised to make him.

No sooner had Josef read the letter than his resolution was taken. 'I will go,' he said, 'to Master Ribalta, and ask him to take me into his service. Who knows

how I may get on!' As he left his lodging, he saw the street filled with an immense crowd attending a procession of monks and soldiers. In the midst of the latter walked a man, closely guarded, whose hands were tied behind his back, and who was accompanied by a tall personage dressed in a robe of red serge, and carrying in his hand an ominous-looking coil of rope. Josef Ribera immediately perceived that this was an unfortunate criminal going to the place of execution; and as he had a taste, whether natural or acquired, for the gloomy and the terrible, he joined the procession, and stayed to witness the execution. The body of the criminal was sentenced to remain suspended from the gallows until nightfall; and, despite of the rain, which began to fall in torrents, Ribera continued for hours watching its ghastly features, as it swung to and fro. Any one that saw the young man seated on a kerb-stone, his eyes fixed on the gallows, heedless of the rain that beat on his head, and ran down his clothes, would naturally have taken him for some near friend or relative of the criminal waiting to receive his corpse. But an interest of a different kind kept Ribera at his post; and when the twilight darkened into night, instead of going to Ribalta's house, he returned to his own lodging, and shut himself up in his chamber. There, with paper and crayons, he began to reproduce the frightful model he had spent the day in contemplating. Under the influence of a sort of feverish excitement, he continued to work all night. In the morning his sketch was finished, and it scarcely required the aid of colouring to add to its horrible reality.

Soon afterwards Ribera, with his drawing in his hand, repaired to the dwelling of Ribalta. It happened that the artist was that day in a very undignified state of irritation. He had just turned off not only the apprentice who ground his colours, but all his pupils who thought it beneath their dignity to perform this office for him during a single day. One of them, whom Ribera met on his way, told him these particulars.

'And thou art a gentleman too, I'll warrant me, and think'st thyself too grand to prepare my palette?' exclaimed Ribalta when he saw the young man enter.

'Master,' replied Ribera, respectfully doffing his cap, 'I am, as thou sayest, a gentleman; but I think the best and noblest gentle in the land would not be degraded by serving a great artist. I will then most gladly become thy colour-grinder, and also thy pupil—if you judge me worthy of that honour,' he added, displaying his sketch.

These words pleased Ribalta, and the drawing charmed him. He gave the young man a cordial embrace, and said: 'Thou shalt be my pupil, and one that will do me credit, since thou art free from miserable vanity!'

The promise and the prophecy were both fulfilled: the hasty, but generous Ribalta not only instructed Josef, but also fed and lodged him in his house; and the young man's progress was extremely rapid.

From the conversation and example of his master, Ribera contracted a longing desire to visit Italy, and perfect his studies there. Accordingly, having saved a little money, in 1605 he set out for Naples, accompanied by his brother, who was now in the army, and going to join his troop. Arrived there, Josef became a pupil of Michael Angelo Caravaggio, and was soon distinguished amongst his numerous companions for his talents and perseverance. His master bestowed on him counsel and commendation, which aided his genius and flattered his pride; but he sorely missed the almost parental kindness of Ribalta. He suffered much from poverty, yet the consciousness that he was becoming, in the highest sense of the word, a painter, supported him under all his privations.

After the death of Michael Angelo, Ribera went to Rome, and there studied diligently in the schools of Raffaele and the Caracci: the sight of their great works tended much to modify the harshness and gloomy

grandeur of the style which he had previously acquired, and which was so perfect an imitation of Michael Angelo's manner, as to cause some of his paintings to be mistaken for those of his great master.

Despite of his poverty while at Naples, he had preferred independence to the haughty patronage of Cardinal Borgia; and now at Rome he gave offence to a noble of rank, by choosing to reside in a miserable attic, instead of eating the bread of dependence in a splendid palace. During this period of intense study, his chief productions were sketches which he used to barter with the market-people for food: his customers surnamed him 'Lo Spagnoletto' (the young Spaniard), and by this title he has ever since been known. This was precisely the most glorious period of the Lombard school of art, and the greater number of the masters who rendered it illustrious were assembled at Rome—some at the commencement, and others at the middle or end of their career. There might be seen conversing together the Caracci, Albano, Dominichino, Lafranco, Guercino, and Guido, of whom it was said: 'Other artists work like men, but Guido works like angels.'

Pride, which throughout life was the ruling passion of Ribera, served to restrain his natural desire of producing pictures, in order that, by means of severe and well-disciplined study, he might one day become the successful rival of those mighty men who were now famous while he was obscure. Therefore, without murmuring at his lot, Spagnoletto lived at Rome completely absorbed in study, and enduring every imaginable privation of physical comfort. In vain did one of the Caracci offer him the use of his studio and models; Ribera refused to avail himself of the generous artist's kindness, in order not to burthen himself with the duty of gratitude. After some time he went to Parma and Modena, with the intention of studying the works of Corregio. Having accomplished this, and feeling that he was now really an artist, he returned to Naples, and applied himself to the task of painting for fortune as well as for fame. Yet he met with so little encouragement, that at times he felt tempted to throw aside his palette, and join his brother in betaking himself to the profession of a soldier.

One morning the owner of the house in which Spagnoletto lodged knocked at the door of his room. Being invited to enter, he asked, with all the politeness of a Neapolitan host, for the amount of board and lodging due to him, which came to the sum of twenty ducats.

Ribera's purse was completely empty, and he frankly said so to his creditor.

'And how am I to live without my rent?' was the natural question of the host. 'There is a gentleman now applying to me for a lodging, and I have not a single room to give him.'

'Except mine: I am going away.'

'Then I may let your apartment?'

'Certainly: I shall leave it this evening.'

Accordingly the artist engaged a porter to remove his effects, consisting entirely of canvas, lay-figures, and easels; but as he was departing, the host stopped him, and again asked for his rent.

'I told you before I have no money.'

'Well, well, give me these three pictures which you have under your arm, and you shall have a receipt in full!'

Ribera willingly consented, and betook himself to a very humble lodging in the neighbourhood, while his former landlord decorated his house with the three splendid sketches which he had obtained.

In a few days our artist received a visit from a little old man dressed in black, who carried one of the sketches in his hand, and asked Ribera if it was he who had painted it. On receiving an answer in the affirmative, the old man, who was a picture-dealer on

a very extensive scale, bespoke a painting of St Magdalen, for which he promised to pay sixty ducats. The order was quickly executed, and paid for; and this formed the foundation of Spagnoletto's renown. He was now beset with applications for pictures, and he worked indefatigably. Almost every week he produced a *chef-d'œuvre*, which the noble amateurs in Naples covered with gold; and amid his incessant occupations, it is marvellous how he found time to woo and wed the only daughter of his first patron, the picture-dealer, who bestowed on him a large fortune.

About this time the viceroy gave a magnificent fête. At a short distance from the palace Ribera had exposed to public view his painting representing the martyrdom of St Bartholomew. The admiring crowd were so carried away by their feelings of enthusiasm, that the viceroy mistaking their plaudits and acclamations for the noise of a rising tumult, sallied forth, sword in hand, at the head of his guards and guests. As soon as he learned the cause of the uproar, he sent for the artist, whom the people had honoured with such an ovation, granted him a pension, and assigned to him apartments in the palace, with the title of 'Painter to the Viceroy.'

From that day Spagnoletto equalled the richest lords of Naples in fortune, and the noblest in court favour. He soon began to make a somewhat ostentatious display of his newly-found wealth and greatness. No palace in the city was more frequented than the painter's dwelling; his banquets rivalled in splendour those given by the Duke of Arcos; and every morning his almoner distributed large sums in charity to a number of poor persons. This latter custom obtained for him the notice and approval of the pope; and that no distinction might be wanting to him, he was enrolled amongst the members of the Academy of St Luke. Yet despite of his lofty position, and the universal favour which he enjoyed, Josef Ribera was a miserable man: envy preyed on his heart. Dazzled by prosperity, almost delirious with pride, he could not endure the thought of a rival. Many excellent judges, while acknowledging his merit as a painter, decreed the palm of superiority to an artist of Bologna, who had painted the 'Communion of St Jerome' for the price of fifty crowns—a trifling recompense, indeed, for one of Domenichino's finest creations; but it is not in the seventeenth century alone that we find instances of ill-rewarded merit.

A glorious career would have been that of Spagnoletto, had it not been for the implacable hatred with which he pursued Albano, the Caracci, and, above all, Domenichino Zampieri, commonly called Domenichino. It is said that Ribera at first tried to eclipse this latter rival by returning to the manner of Michael Angelo; but the public refused to his works that exclusive admiration which he coveted, and took the liberty of praising the paintings in the Duomo di San Geomajo, of which the portion confided to Domenichino had just been finished and displayed to view. This impartiality of the public cost poor Zampieri dear. One day while he was absent, a workman, bribed by his enemies, altered the composition of the stucco prepared to receive the remainder of the fresco in such a manner that as soon as the colours were laid on, the whole cracked and peeled off. Ribera has been commonly accused of this dastardly action; but even had it been done by others (and Domenichino had bitter foes beside), the relentless and obstinate persecution which Spagnoletto directed against his rival, would suffice to fix a dark stain on his memory.

Little fitted to contend with his powerful enemy, Domenichino fell into a state of profound melancholy, which terminated in the loss of his life by poison; but whether administered by his own hand, or by that of another, remains a doubtful question.

Not long after the death of the ill-fated Zampieri,

the heart of Spagnoletto was cruelly pierced through its only vulnerable spot. The only human beings whom Ribera seemed really to love were his two daughters. One of these had married a Spanish gentleman holding a high office at Madrid; the younger was living at home with her father when Don Juan came to Naples to suppress the sedition raised by Masaniello. This accomplished, the general celebrated the triumph in arms of his Catholic majesty, Philip IV., by a succession of splendid fêtes. At one of these Don Juan saw the beautiful daughter of Ribera, and succeeded in carrying her off with him. The grief of the outraged father knew no bounds. The rank of the offender sheltered him from the painter's vengeance, and the latter retired to the solitude of his villa at Pausilippo. Soon afterwards, having ascertained where Don Juan was likely to be found, he set out, accompanied by a few armed servants, in order to lie in wait, and slay his enemy in an ambuscade. From that day he was never seen or heard of. It is supposed that he either perished in the enterprise, or killed himself in despair at having failed to accomplish it. This mysterious disappearance took place in 1636: Spagnoletto was then sixty-eight years old.

Amongst the principal works of this great painter may be named the 'Adoration of the Shepherds,' 'St Bartholomew,' and 'The Death of Cato,' at the Louvre; at Naples, 'St Bruno,' 'The Apostles' Communion,' 'The Twelve Prophets,' and the 'Descent from the Cross,' in the convent of St Martin; and finally, at Madrid, 'Jacob's Ladder,' which a tourist has compared to 'a torrent of light.'*

GLASGOW IN THE LAST CENTURY.

FOURTH ARTICLE.

AMONGST the eminent names connected with Glasgow in the last century is that of Dr John Moore, author of 'Zeluco' and other novels, and the father of Sir John Moore. He practised as a physician in the city, and appears to have lived on easy terms with the eminent merchants, joining them in a convivial association called the Hodge-Podge Club. There is still extant a poem written by Dr Moore on this fraternity, which has not, as far as I am aware, been printed. Indeed it is scarcely fitted for publication, except as a curiosity of the past for the use of Glasgow alone, the verses being each devoted to the character of a particular member of the club, in such vague terms as, though no doubt most pleasant to those who knew the persons, are somewhat rapid to us. It opens thus:—

A club of choice fellows each fortnight employ
An evening in laughter, good-humour, and joy;
In this club there's a mixture of nonsense and sense,
And the name of 'Hodge-Podge' they have taken from
thence.

Like the national council they often debate,
And settle the army, the navy, and state;
But should you wish to know more of this merry class,
Like the kings of Macbeth they shall one by one pass.

The second figure is that of Mr Peter Blackburn—

Laugh Peter the next of our group that appears,
With his weather-beat face and his heathery hairs;
His humour is blunt, and his sayings are snell;
He's a ——— honest heart, but a villainous shell!

There is some humour, as well as descriptive force,
In the picture of a banker, Sir James Simpson—

Now forward comes Simpson, so lean and so lank,
Yet may know by his face there's a run on the bank;
Oh why thy bag-wig dost thou shake at me so?
Thou can't not say I did it, ghostly Banco!

Mr Orr of Barrowfield is sketched metaphorically—

A pair of gold buckles without any carving,
In figure and workmanship not worth a farthing;
At home manufactured and plenty of metal—
An emblem of Orr, and it fits to a tittle.

I remember the subject of the following verse, at a different period of life, a fine specimen of the Scottish gentleman of a former day—

Easy Murdoch comes saunt'ring, as if in a dream;
He ne'er strives with the current, but follows the stream;
On your voyage through life, Peter, choose thy friends
well,
'Tis in their power to lead you to heaven or to hell.

Mr John Cross is invested with a moral dignity not very congruous with the spirit of the poem—

Independence is marked in each feature he bears,
The opinions of others he nor cares for nor fears;
To no one he'll cringe for distinction or pelf,
John boldly steps forth and depends on himself;
No losses or crosses can e'er him affect,
Misfortune he bears till he hears our respect.

The description of a member of the Garnkirk family—

With feelings too nice to be ever at ease—

is in fine contrast with Cross and Blackburn; and the concluding couplet would not have looked out of place in Goldsmith's 'Retaliation'—

Applaud he's a wit, contradict he's a dunce,
Retort on Dunlop, and you gag him at once.

Dr Moore had not, on the whole, much credit from his pupil, Douglas Duke of Hamilton, with whom he had made the tour of Europe. This young nobleman threw away fine talents, and the graces of a not ungenerous character, in vicious amusements and low company. When he visited Glasgow he was more frequently to be found at the cock-pit than in the Assembly Room. A story is told of a sporting butcher, who, meeting the duke in some of these low scenes, and being irritated by contradiction regarding a bet, exclaimed with a fierce imprecation, 'My lord duke—your Grace—you lie!' Yet, as often happens, this careless young nobleman was not without a sense of what was due to his rank. A neighbouring proprietor in the county, certainly a very handsome man, who thought he resembled the duke in personal appearance, went up to him one day at a party, and said: 'It is very odd, my lord duke, that I am so frequently taken for your Grace.' 'Very odd indeed,' said the duke, 'for I am never mistaken for Mr Stirling!'

Of the natives of Glasgow during the latter part of last century, none were more highly distinguished than Sir John Moore and Sir Thomas Munro. The former left Glasgow at an early period of life, and I do not recollect that he ever revisited it. The latter did revisit Glasgow after many years' absence, and appears to have retained to the last a vivid and agreeable impression of the scenes of his youth. When he first returned from India, Sir Thomas Munro met accidentally in London an old schoolfellow of his, Mr Buchanan of Ardoch, then M.P. for Dumbartonshire. Neither had seen the other for very many years. On Mr Buchanan offering his hand to Sir Thomas, and asking if he recollected an old acquaintance, the latter looked steadfastly at him for a second or two, and then said, 'John Buchanan, I would have known you among a thousand.'

When he came to Glasgow, Sir Thomas Munro paid a visit to another old schoolfellow, a worthy candle-maker of the name of Harvie, who had a shop in Stockwell Street. 'Well, Mr Harvie,' said Sir Thomas on entering the shop, 'do you remember me?' Harvie gazed for some time at the tall, gaunt figure before him, striving to recall his features. At last he said:

* This sketch is abridged from the French of De Chailillon.

'Are ye *Millie Munro*?' 'I am just *Millie Munro*,' said the other, and the quondam schoolfellows had a long chat about the 'days o' langsyne.' Sir Thomas was represented by his school-companions as having been the 'hero o' a hundred *stone-fights*,' or battles of any other kind: in short, the bully of his class, in which, from his proficiency in *milling*, he received the above nickname.

In the course of these sketches I have mentioned one or two of our lord provosts. How these functionaries would be astonished could they look up and see the changes which have taken place in their native city since they left this sublimary scene! Even the very costume which in former days rejoiced the cockles of the heart of many a Baillie Nicol Jarvie, as a mark of distinction from the *ignobile vulgus*, has been discarded by the liberal notions of modern times; and the triangular cocked-hat and handsome suit of sables are no longer the badges of civic authority.

Before quitting the subject, let me recall an anecdote of one of our chief magistrates, who held the reins of office in days of yore, 'when George the Third was king.' But it is necessary to my story that I should first describe his dress.

On public occasions, besides the formidable *chapeau* above alluded to, and gold chain of office, which is still worn, the dress of the lord provost was a black velvet coat and vest, *shorts*, black silk stockings, and handsome knee and shoe-buckles. He also wore a bag-wig, which, when boys at school, appeared to myself and companions as being 'very grand.' A personable man looked particularly well in this dress, which shewed off the figure to advantage; but the defects of external appearance were equally conspicuous. The gentleman whom I have in view was one of the most intelligent and patriotic of our citizens, but in his outer man exceedingly thin and slender, and withal having, like Sterne's monk, a 'mild, pale, penetrating countenance.'

As the story goes, a lady from the country had seen him in 'full fig,' at some public place, perhaps a dancing assembly, and inquired who he was. On being told that he was the lord provost of Glasgow—'Lord provost!' she said; 'dear me! *I thocht it was a corp run awa wi' the mortelath!*'

In the early part of the last century, there was great strictness of religious observance in Glasgow, particularly regarding the keeping of the Day of Rest. Some families admitted of no domestic work of any kind on that day; a few did not open their shutters, except only as much as was necessary to see to read. A set of officials, styled compurgators, but vulgarly known under the name of *hornies*, walked about in time of service, to take up any person whom they found strolling about. It so happened at length that the *Rough Peter* of Dr Moore's poem fell into their hands one day, while walking with a friend on the Green: he raised an action against the magistrates, and succeeded in his suit; which put an end to the compurgators. I have heard old people who remembered the circumstances say, that thereafter the Green was filled with Sunday promenaders. The bow had been too much bent, and the recoil was proportionate.

The published sermons of at least two of the Glasgow divines of those days shew that the authors (Drs Leechman and M'Laurin) were worthy contemporaries of the great men whom I have already mentioned. These discourses may still be read with edification from their piety, and with pleasure on account of their style. The rusticity which appears to have once belonged to the Scottish church had now, I apprehend, vanished in the principal towns; but it was still to be found in some of the country clergy. In my own younger days, there was a certain minister of Dumbarton, a shrewd observer, but who, in addressing a country audience, seems to have judged it necessary to adopt the language and modes of thinking with

which they were familiar. Preaching one day in the neighbouring parish of Bonhill, on the danger attending a relapse after conversion, he told his hearers 'to remember Lot's wife; who, you all know, turned and looked back, though she was strictly warned against it; and she was turned into a pillar of salt, as she remains to this day—for *ony thing I ken to the contrary*.' The last part of the sentence was in theatrical phrase an 'aside,' reminding us of Burns's—

* His carnal wit and sense

Like hafflin's-ways o'ercomes him

At times that day.

A dissenting meeting-house in Dumbarton had proved a sore annoyance to the same minister. But we are commanded to forgive our enemies; and Dr O—, after enumerating the unconverted Jews, and unregenerate heathen, prayed fervently 'even for that *hobble-schaw* at the Brig-end.'

A certain minister of Campsie, whom I recollect very well, might have figured as one of the originals in the satirical work above alluded to. He was a large, strong-boned man, the son, as he used to boast, of the miller of Campsie; and certainly in appearance was far better adapted for the labours of the mill, or of the plough, than for those of the church militant. The minister was one day rudely insulted by a parishioner, who, unfortunately for himself, alluded to the black coat of the clergyman as preventing him from going farther. 'That shall be no objection,' said the divine; and stripping off his coat, which he laid on a hedge: 'Minister,' he added, 'lie thou there! James L—, stand thou here!' and gave his antagonist a thrashing to his heart's satisfaction.

From the following anecdote it would appear that the Glasgow ministers had stock sermons in those days, as well as in later times. A young man on the eve of going out to America heard his father preach a sermon from the text, 'Adam, where art thou?' On his return, after an absence of many years, he went on the first Sunday, as was meet, to his father's church, when the good old gentleman read out the same text, 'Adam, where art thou?' 'Mother,' said the son, who was a noted wag, 'has my father not found Adam yet?'

The English public is aware that instrumental music is not used in the Scotch church. There have been many who desired to see it introduced; but the general spirit of the nation is against it. Early in the present century, an amiable Glasgow divine went so far as positively and unauthorisedly to break this rule. Being a member of his congregation at the time, I was present when one Sunday, on the psalm being read out as usual by the minister, a small organ commenced playing the tune to which it was to be sung. It was one of those fine-old melodies, which at one period formed exclusively the psalmody of Scotland. At the first line, scarcely any of the congregation joined; at the second line, a few more were emboldened to add their voices; still more at the third line; and, before the conclusion of the verse, almost every one who had been accustomed to follow the precentor sung as usual. The congregation was pleased, but not so the presbytery. Dr Ritchie was immediately interdicted from this 'daring innovation,' and the question was appointed to be tried at the next meeting of presbytery.

The novelty of the case excited a great deal of public interest, and the Tron Church, where the discussion was held, was generally crowded. I had an opportunity of hearing a great part of the debates, and am sorry to say that they did not reflect much credit on the charity of the reverend disputants. One of the learned doctors gave a very intelligible hint to the bystanders, that 'had such an attempt been made in the days of their fathers, some of them' (meaning Dr Ritchie) 'would have had a bad chance of escaping summary justice that evening.' But the most amusing part of the

meeting was, in hearing the arguments made use of against the organ by some of the country clergy. 'I have a little boy at home,' said one of these speakers, 'who once took a fancy to a whistle, and nothing would please him but the whistle, and the whistle he would have; and,' continued the eloquent divine, rising with his subject, 'suppose you indulge the *tasty* congregation of St Andrews with their organ, what is to prevent others from applying—one for a *flute*, another for a *fiddle*—or, perhaps, a Highland congregation demanding a *BAGPIPE*?' The rejection of the organ was carried in the presbytery by a triumphant majority. Fortunately for Dr. Ritchie, he soon afterwards received a call to Edinburgh, which he accepted. On his leaving Glasgow, there appeared a caricature which would not have disgraced H.B., representing the reverend doctor as a sturdy strolling musician, bearing an organ on his back, on which he was grinding, 'We'll gang nae mair to yon town.'

The prejudice against an organ amongst the lower classes in Glasgow appears to have been much stronger at one time than it probably would be at present. Two *swaggers* are said to have had a regular 'fit of flying' one day, when, after having nearly exhausted their rhetoric, one of them concluded, 'Eh, woman, what hae ye to say—we keep the keys o' the *whuslin' kirk*' (the Episcopal Chapel.)

JOURNALISM BEYOND THE ROCKY MOUNTAINS.

'THE DESERET NEWS' is the title of a newspaper published by a Mormon editor at one of the settlements of that singular people west of the Rocky Mountains, to which region they betook themselves on their expulsion from the state of Missouri a few years since. The paper is a curiosity in its way, as much from the peculiarity of the articles and information conveyed, as from its dimensions. It is about the size of our Journal, and consists of eight pages. No reader need be in any uncertainty as to the locality of the printing-office: for the editor heads his sheet with 'lat. 40° 45' 44", long. 111° 26' 34"', closely followed by the announcement that the 'Deseret News' is 'published every other Saturday at a charge of 2½ dollars for six months, if paid in advance, or 15 cents for a single copy. The charge for advertisements of twelve lines is 1½ dollars for the first insertion, and 50 cents for each repetition.' A list of agents succeeds, among whom is 'Bishop Holladay, and all the acting bishops in the city,' and subscribers are informed that the paper will be 'delivered at the post-office, which will be open each Sabbath from twelve to one o'clock P.M.'

Presently we come to a 'PATRIARCHAL NOTICE.—I take this method to notify the brethren of the city and vicinity, that I will attend to all calls in the line of my office hereafter, particularly on Saturdays and Mondays of each week; also on other days of the week when convenient. JOHN SMITH, Patriarch.

'N.B.—Office near the north-west corner of the Temple Block.'

Then we have a 'Proclamation to the Saints,' or a 'Word of Wisdom,' particularly recommended 'to the twelve high priests, seventies, elders, bishops, priests, teachers, deacons, brethren, and sisters.' Wine is only to be used for the sacraments, and 'this should be wine—yes, pure wine of the grape of the vine, of your make. And again, strong drinks are not for the belly; but for the washing of your bodies. And again, tobacco is not for the body, neither for the belly; and is not good for man; but is an herb for bruises and all such cattle, to be used with judgment and skill. And again, hot drinks are not for the body or belly.' Exhortations follow in a similar strain concerning the uses of flesh, fruits, grain, and vegetables; and the 'Word of Wisdom' concludes with the pertinent in-

quiry—'Why is it not wisdom to make a common practice of drinking tea, coffee, or hot drinks of any kind? Physicians, philosophers, elders in Israel, will you please to answer?'

Other subjects are treated in accordance with the interest felt in them by the community to whom they are addressed. A short paragraph states that the General Assembly had met in the Representatives' Hall on a Monday in December, and having received the governor's message, and sat for four days, adjourned to the first Monday in January. From another sentence we gather that a mint is established, for the tithing office is announced as removed to a room in the coin-stamping edifice. Under date November 30, we read that the mail started for the United States, escorted by several military officers, from a major down to a sergeant. They went 'over the big mountain,' and during the night rescued a mule and a man from 'seven large white shaggy wolves.' The mail inwards 'passed through snow from one to three feet in depth for seventeen days,' bearing important dispatches from Washington.

Among miscellaneous matters, we are told that 'the improvements of the age are great—such as making good cheese of potatoes, sewing more than a yard per minute without hands, setting horse-shoes without nails, making many big candles with little tallow, preserving butter perfectly sweet for years without salt, restoring and preserving sight without glasses; and almost everything, except being saved without keeping the commandments.' From this it would appear that the Rocky Mountains are no barrier to the march of intellect; neither is the editor without an eye to business, for in another paragraph, headed RAGS!! RAGS!! RAGS!!! he counsels his readers to 'Save their rags—everybody in Deseret, save your rags; old wagon-covers, tents, quilts, shirts, &c. &c. are wanted for paper. The most efficient measures,' he continues, 'are in progress to put a paper-mill in operation the coming season in this valley, and all your rags will be wanted. Make your woollen rags into carpeting, and save importation.' Literature makes a demonstration in 'NOVELS! NOVELS!! all the latest for sale, by J. & E. REESE;' and the 'Parent School' is advertised as 'under the direction and supervision of Professor Orson Spencer,' with a favourable prospect 'for a rapid advancement in the sciences,' at eight dollars per quarter, 'one-half in advance.' Samuel W. Richards announces himself as the 'appointed committee to make preparation and give any information necessary;' and W. Woodruff intimates that readers would do well to purchase from his 'large and well-selected assortment of school-books,' 'that their children may be rapidly advanced in the various branches which will be taught the present winter.' The go-ahead principle seems to be not less active among the Mormons than among the other population of the United States.

The 'sex' are cared for by 'Mrs A. Smith,' who 'invites the ladies of Great Salt Lake City and vicinity, to the inspection of a superior assortment of velvet, silk, satin, and straw bonnets, and a variety of millinery and fancy goods;' and the fathers, brothers, and husbands of the former are assured by William P. McIntire that 'he is prepared to make coats, cloaks, pants, and vests, in the latest and most approved styles.' Nor are other physical requirements forgotten: 'a supply of fresh beef is constantly on hand at the old stand of B. Stringham, a little south of the Council House;' and Charles White 'is prepared to drive all kinds of stock to his herd ground at Black Rock, twenty miles west of this city, on Monday in each week;' and shingles are served at 5 dollars 50 cents per thousand, when the timber is furnished, and 50 cents deducted when the timber is rolled on the log-way, and the shingles removed by the owner as fast as they are manufactured.'

From all these items we may form some idea of the doings of these far-western settlers; there is an evident touch of originality about them, which will perhaps disappear when the great national railway from the Atlantic to the Pacific shall be finished. We close our notice with two advertisements which appear to be unique of their kind:—'Willard Snow, Esq.' publishes a 'Fair Warning! Third and Last Call!—All persons indebted to Sam'l Bringham for making cradles, are requested to call and settle their accounts forthwith, if they wish to save cost, as he has gone south, and left them in my hands for collection, for the support of his wife, who is in want of the wheat immediately.' And P. P. Pratt announces, that he 'is intending to take his departure on the 1st of January 1851, and may be absent for some years on a foreign mission: This is, therefore, to inform his debtors that he frankly forgives all debts due him, and calls upon all persons who have demands against him to present them for payment on or before the 25th of December next, or ever after hold their peace, as he wishes his family, during his absence, to be free from such annoyances as duns, blacksmiths, cobblers, lawyers, sheriffs, and butchers' bills, &c. And should he live to return, he would like to rest in peace, without having old debts to stare him in the face.'

With such contents the 'Deseret News' may very fairly claim to rank with the Curiosities of Literature. The sheets a hundred years hence will often be quoted as evidence of the 'good old times.'

THINGS TALKED OF IN LONDON.

May 1851.

On the morning of the 1st I walked from the north-east quarter of our vast city to its western suburb, and on the way could not help being struck by the deserted and quiet appearance of many of the off-streets. Numerous shops being shut, gave them somewhat of a Sunday look. But on emerging into a main thoroughfare—Oxford Street, for instance—the scene was different. There a great human tide was flowing westward, attracted by the long-talked-of opening of the Exhibition. I entered Hyde Park by the marble arch—which, by the way, looks uncommonly well on its new site—and just within the gate came upon the rear of the line of carriages, the foremost of which was more than a mile distant. Here was an earnest of what might be expected on getting nearer to the culminating point; and strolling quietly onwards, I watched the visitors as they advanced along the numerous paths which intersect the sward. On they come in pairs, or groups of tens and twenties, all animated and expectant, and in their silks and satins, broadcloth and cotton, exhibiting not a few triumphs of British industry. At the Apsley House gate the throng and excitement were still more remarkable; and it happened to some individuals who lived in Piccadilly, not far from the Park, and who set out to ride to the Crystal Palace, that they had to be driven eastwards as far as Long Acre before they could fall into the line of carriages. Already the grand avenue of approach was flanked by closely-packed rows of sight-seers, five or six deep, gifted apparently with unwonted powers of patience and endurance, and growing denser and broader the nearer to the building. Everything conspired to give an imposing effect to the latter, for the May-day sun shone brightly, under which the glass glistened, and the gay flags looked gayer as they shook in the breeze. On every side of the edifice were congregated the fast-increasing multitudes; and it seemed miraculous that none were hurt as carriage after carriage dashed up to the several entrances, and discharged their living loads. Groups of eager gazers pressed as near to the open doors as janitorial policemen would permit, eager to catch a glimpse of the treasures within, or of the perspective lines of the galleries and columns,

fading away in a blended maze of red, white, and blue. The model frigate on the Serpentine, decorated with flags and bunting from bowsprit to spanker-boom, presented in herself an object of much attraction, and between the water and the building the throngs were greatest. Look whichever way you would, thousands upon thousands of human beings met the eye; every rise and vantage-ground shewed tier above tier of heads. Beyond the Serpentine, too, the crowds were not less numerous, forming an unbroken line along the bank, with irregular columns stretching far up the slopes between the trees. It was a most impressive spectacle—such a gathering as few or none of us will ever see again. Hundreds of thousands assembled in a spirit of order and good-humour, to celebrate the most famous holiday that England has yet seen.

By and by was heard the clang of trumpets, and a distant shout, which came nearer and nearer; the helmets and plumes of a troop of horse seemed to swim rapidly along between the lines of spectators; a carriage followed, stopped at the northern entrance, and on the summit of the transept the royal banner, rising to the top of the flagstaff, announced that the Queen had entered the Crystal Palace. Presently the National Anthem, sung by the choirs inside, was heard sounding through the glass walls and roof; then a pause, followed by alternating swells and silences of the organs, and ending with the mighty Hallelujah chorus; while without the thunder of cannon proclaimed the inauguration complete.

How impressive the moral! For the first time since the world began an ovation had been accorded to Labour! Here thought, and skill, and the rude might of the horny hand, shewed themselves in their majesty; and industry, wondrous in form and exhaustless in energy, triumphed over the idle, the incapable, and the inane.

As yet the feeling of all who have seen the Exhibition is the reverse of disappointment; and before long when the cost of admission comes down to a shilling, we shall be overwhelmed with details and descriptions. Meantime, except certain chagrins to the exhibitors, all goes on pleasantly. The better to keep eruptive foreigners in order, we have imported a troop of Prussian and French police; but the chances of their being needed to quell turbulence is believed to be as remote as the rumoured blowing-up of the Crystal Palace with gunpowder. The labels in shop-windows, announcing that foreign languages are spoken within, are multiplying, in many instances deceitfully; and here and there you see a notice in German at newspaper offices, asking for compositors. Of all the activities promoted by the Exhibition, that of printing seems at present the most lively.

You may now know whereabouts you are when walking our streets, for the names of the thoroughfares are newly and universally painted at their extremities and intersections. And our red-frocked shoe-blacks stand ready, in convenient localities, to develop the latent properties of Day & Martin—an operation which, owing to its novelty, attracts a crowd of on-lookers. And go where you will, prints, books, maps, or medals, all more or less relating to the Exhibition, are thrust upon your notice by clamorous vendors. But I must now beg leave to pass to other topics.

You of course remember Kinkel, who was professor at Bonn, and got shut up in prison at Spandau for meddling with politics, and afterwards made his escape; he is now delivering a course of twelve lectures on the 'Modern Theatre,' at one of our west-end assembly-rooms. There are many who will go to hear the celebrated German from other motives than those of mere curiosity. There have been some good lectures too at the Royal Institution, including a second from Faraday on the magnetism of the atmosphere—popularising the important facts contained in the papers which I

told you some time ago were read before the Royal Society. But the most notable philosophical subject which has come on for discussion of late, is the much-talked-of pendulum experiment, which having first come to light at Paris, has been subsequently repeated in several parts of Europe, and in our own country. The originator is M. Foucault, who, as stated in his communication to the Académie, first discovered the phenomenon in question while conducting a series of observations on the pendulum in the cellar of his house. By means of it, the rotation of the earth on its axis is said to be demonstrated as clearly as by astronomical observations. At first sight it seems impossible that any contrivance which partakes of the motion of the earth could be made to exhibit that motion. The explanation, however, appears to be, that the plane of vibration, or line of direction, in which a pendulum is set going, never alters, notwithstanding that the point of suspension may be carried round by the earth's rotation; consequently if a pendulum be made to vibrate at the pole, we can understand that an object fixed in the earth at one extremity of the line of vibration will, in twenty-four hours, have been carried round the other extremity, and brought back to its starting-point—the pendulum all the time having been swinging in the same line, and thus rendering the rotation evident. The same effect, with differences of time according to latitude, would be observed on descending from the pole, until, on reaching the equator, the result altogether disappears, owing to certain compensating causes best understood by mathematicians. In order to test the fact, especial pains must be taken with the mode of suspending the pendulum, which should be a wire with a perfectly round ball or bob at the lower end. The best mode of suspension is said to be to pass the wire through a hole in a plate of metal, and secure it on the upper side, whereby no bias is given to the swing.

Suppose a pendulum set agoing according to these conditions, and hung from the centre of a ceiling: you make a perpendicular mark directly in a line with the wire on one of the walls towards which the bob swings: then immediately opposite, near the farther wall, you fix an upright eight-staff, which shall be precisely in a line with the wire and the mark on the wall beyond. The adjustment may be made exact, by placing the eye at one side of the staff, in the same way that jockeys 'take sights' at races. Go away for an hour, and then apply your eye a second time: you will find that the staff has been carried to the left, or the course followed by the hands of a watch: the pendulum has preserved its line of direction, but the earth is rotating round it; and thus hour after hour the staff will be carried onwards, until it has performed an entire revolution. The time required to complete the circle here, in London, is said to be 30 hours 40 minutes, and at Paris, owing to difference of latitude, 32 hours 8 minutes; and herein consists an insuperable difficulty for those unacquainted with mathematical laws. How is it, they ask, that the revolution round the pendulum and the rotation of the earth are not coincident—namely, twenty-four hours? No satisfactory popular solution has yet been given. Some other embarrassing points have been urged, which I need not stay to particularise; but as Professor Baden Powell, assisted by Mr Wheatstone, is to give an experimental lecture on the subject at the Royal Institution, we shall soon know whether the apparent effect be an illusion or not. The subject was much talked of at Lord Rosse's first soirée, given at the beginning of the month; and two of the most distinguished Fellows of Trinity College, Dublin, gave clear demonstrations of the phenomenon. I may tell you, however, that several of our most eminent mathematicians discredit the assumed results altogether: meantime the managers of the Polytechnic Institute are exhibiting the pendulum

experiment to all whose curiosity impels them to have ocular demonstration of the rotation of the earth.

According to M. Baudrimont, a plumb-line at rest will shew the fact as well as a pendulum in motion; and he informs the Académie, that an instrument might be constructed which 'would serve not only to demonstrate the diurnal movement of the earth, but could also be employed for an exact division of time. If we suppose,' he continues, 'a solid mass supported on an axis, round which it can move freely; and if we admit, besides, that this axis is maintained parallel to that of the earth, whatever may be the place of observation, it will be found that the mass disposed as described, and subjected to those forces solely which may compel it to a circular movement round the axis of the earth, would, by virtue of the inertia of matter, behave in such a way that one of its meridian planes would remain parallel to a plane supposed to be fixed in space, and that by an apparent movement it would appear to perform a revolution round its axis, while in reality it would be only the earth that turned.'

You will recollect my calling your attention to M. Chas. Mène's chemico-horticultural experiments: since those were reported, he has made others with a view to ascertain the proportion of azote taken up by growing plants. In a barren soil, composed chiefly of pounded glass, he sowed wheat and peas, and applied no other moisture than distilled water. The plants grew; but on comparing their quantity of azote with that contained in seeds of the same, the peas had not increased more than one-third, and the wheat one-fourth. He next raised several other kinds of vegetables under a handlight, in which he created a determinate atmosphere, and analysed it daily. The constituents of this atmosphere were—twenty-five parts each of oxygen and carbonic acid, and fifty of azote; and it was found, as the experiment went on, that although the plants had 'fixed,' a portion of the latter gas—the quantity at first thrown in—was not diminished. From all of which M. Mène infers, that 'plants absorb from the soil and from manure all the azote necessary to them, and that they do not take it directly from the atmosphere.'

Passing to other matters, Messrs Wertheim and Breguet have been experimenting on the rate of velocity of sound in telegraph wires, as observed on the Versailles Railway. The best signal was found to be the stroke of a hammer on one of the posts. The blow being struck, an attendant, holding a chronometer, noted the precise instant of the concussion; while another, stationed far away, noted its arrival. The greatest distance over which it was possible to test the transmission was 4067 metres; for, singularly enough, the sound would not pass through a tunnel, notwithstanding that its intensity was such as would have been perceptible at a much greater distance. The rate was ascertained to be 3485 metres in a second, while, theoretically, it should have been 4634. The question is to be further investigated on a line where great lengths of wire extend independent of tunnels.

Our doctors have been talking about certain medical and physiological subjects which have also come before the Académie. One is M. Buisson's announcement of a cure for hydrophobia: it was written in 1835, and placed, sealed up, in the hands of the scientific corporation, and has only recently been opened. In the year specified, M. Buisson was called on to bleed a woman who had been bitten by a mad dog. While his hands were covered with blood, he wiped them with a towel which had been used to wipe the foam from the mouth of the patient, disregarding a sore that had formed on one of his fingers. At the end of nine days he was seized with the usual symptoms of hydrophobia: pain in the throat and eyes; dislike of viewing brilliant objects; desire to run and bite; and, eventually, horror of the sight of water. 'From the whole of the symptoms,' to quote his own words, 'he judged himself

affected with hydrophobia, and resolved to terminate his life by stifling himself in a vapour-bath. Having entered one for the purpose, he caused the heat to be raised 107 degrees 36 minutes Fahrenheit, when he was equally surprised and delighted to find himself free from all complaint. He left the bathing-room well, dined heartily, and drank more than usual. Since that time he has treated in the same manner more than eighty persons bitten, in four of whom the symptoms had declared themselves; and in no case has failed, except in that of one child seven years old, who died in the bath.'

You are perhaps aware that the incurable nature of diabetes is a subject which has for a long time engaged the attention of eminent physiologists in this country and on the continent. M. Bernard, a French anatomist, states that he has found a remedy in the dividing of the pneumo-gastric nerves—an operation which, as he shews, prevents the occurrence of sugar in the liver. This conclusion has, however, been questioned; and Dr Mitchell of Glasgow finds, after numerous experiments, that the result is not positive, and that whatever be the kind of food eaten, sugar may always be traced in the liver; if not in the surface veins, then in those which lie deeper. His summary is: 'That sugar exists uniformly and normally in the blood of the heart; that its presence there is independent of diet; that the sugar is found specially concentrated in the liver of animals; that there is reason to believe that it is formed in the liver, which thus becomes the seat and origin of the sugar.' From this it will be seen that an important subject of inquiry is here open to physiologists. According to Prout, the liver is the vegetative organ of animals, and chemistry and anatomy will have to work hand in hand to get at the secret which has so long baffled research. It will be no small triumph to discover a remedy against the malady in question, which, as Dr Mitchell observes, 'has hitherto been regarded as beyond the reach of the vis-medicatrix.'

Another medical subject which has come under discussion, is the statement made by Dr Louis Henry on the application of the cold douche to lymphatic, chlorotic, and certain nervous diseases. He regards it as more sure and rapid than any other hygienic remedy. Nine children, from three to twelve years of age, who came under the treatment, and of most decided lymphatic temperament, were completely converted, in the course of two years, to a sanguine temperament; and adults in a chronic languid condition have had their circulation restored to its normal state by the same application. It is another test of hydropathy. Then there is M. Gondret, who offers to betake himself to Sologne, one of the most unhealthy districts of France, or to Algeria, according as the Académie may decide, as he wishes to prove that his theory of dry cupping for the cure of intermittent fevers, and for the shiverings which attend some other affections, is a safe and effectual one. And another *savant*, M. Burg, shews that several neuralgic complaints, which are nearly always negative, may be cured by applying a plate of metal to the part affected. This plate is to be of silver, gold, steel, or copper, or a compound, according to the symptoms. Hence the disease being given, there only remains to determine the peculiar metal for effecting the cure.

Allied to this subject is M. Charles Dupin's inquiry on mortality in France, from which it appears that during the last half of the last century, out of 10,000 births, not more than 5832 were alive at the fifth year; while at present the number is 6841. The former were selected results, but the latter are taken on the average of the whole population. During the last five years, which include one of cholera and one of scarcity, of each thousand deaths in the crowded city of Lille there were 467 fewer deaths than at the close of the eighteenth century, when neither disease nor scarcity

prevailed. On a comparison between Lille and Manchester, M. Dupin finds, contrary to expectation, that the balance of health is greatly in favour of the former city.

You will perhaps consider that I have said enough for the present about physiology and statistics of health. I conclude, therefore, with a rare fact—the *Dummoir* flitch has just been claimed by a couple who have complied with the anciently-prescribed conditions.

GRACE OF CLYDESIDE.

AN, little Grace of the golden locks!

(The hills rise fair on the banks of Clyde,)

As the merry waves wear out these rocks,

She wears my heart out, glides past, and mocks;

(But heaven's gate ever stands open wide.)

The boat goes softly along, along;

Like a river of life glows the amber Clyde;

Her voice floats near me like angels' song;

Oh, sweet love-death, but thy pangs are strong!

Though heaven's gate ever stands open wide.

We walk by the shore, and the stars shine bright,

But coldly, above the solemn Clyde;

Her arm touches mine, her laugh rings light;—

God hears my silence!—His merciful night

Hides me.—Can heaven be open wide!

I ever was but a dreamer, Grace;

As the gray hills watch o'er the flowing Clyde,

Standing far off, each in his place,

I watch your young life's beautiful race

Apart—'till heaven's gates be open wide.

And sometimes when in the twilight balm,

The hills grow golden along the Clyde,

The waves flow silent and very calm,

I hear all nature sing this one psalm—

That 'heaven's gate ever stands open wide!'

So, happy Grace, with your spirit free,

Laugh on!—life is sweet on the banks of Clyde!

It is no blame unto thee or me;

Only God saw this could not be,

Therefore His heaven stands open wide.

But youth's morn passes; swift follows eve;

Age cometh, ev'n on the shores of Clyde;

Ah, then, if my soul its place can leave,

It will whisper thee: 'Love, fear not nor grieve!—

See!—heaven's gate ever stands open wide!'

Just published, price 3s. cloth, 2s. 6d. sewed,

LIFE AND WORKS OF BURNS—VOL. II. Edited by ROBERT CHAMBERS. To be completed in Four Volumes. In this work, the life of the poet is traced more minutely and with more critical accuracy than in any other. The poems and songs are arranged in intimate union with the biography, to which they afford much illustration, while the biography, on the other hand, lends to them a fresh significance and effect.

Price 1s. in fancy boards,

THE SWAN'S EGG. By Mrs S. C. HALL. Forming the 18th Volume of CHAMBERS'S LIBRARY FOR YOUNG PEOPLE.

CHAMBERS'S EDUCATIONAL COURSE.

Price 3s. 6d. cloth boards,

EXCERPTA EX OVIDII CARMINIBUS. Edited by Dr SCHMITS and ZUMPT.

DRAWING BOOKS, price 1s. 6d. each, consisting of a series of Progressive Lessons in Drawing and Perspective, with General Instructions: in Eighteen Books. Numbers I. to VI. are *very* ready, embracing Elementary Lessons—Design—Flowers—Heads in Outline—Heads Shaded—Hands and Feet.

Published by W. & R. CHAMBERS, High Street, Edinburgh. And sold by D. N. CHAMBERS, 55 West Nile Street, Glasgow; W. & O. ORR, Arnon Corner, London; and J. M'GLASHAN, 30 Upper Sackville Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 388. NEW SERIES.

SATURDAY, JUNE 7, 1851.

PRICE 1½d.

THE WORLD 'AT LARGE.'

We all remember the story of the poor lunatic who told a visitor of the asylum one day, that he and his companions regarded the world out of doors as mad, while the world out of doors regarded them as mad; the former, he said, being the majority, had got the upper hand, 'and here we are!' The anecdote has its point chiefly from the shadow of truth there is in it. That truth was enunciated by a physician, when he predicated of all men that they are a little mad. By which we understand it to be meant that most men have some foible or infatuation about them, amounting to something like lunacy. We believe, after all, that there is a decided and essential distinction about minds which are or may become insane; and, as a correlative of this proposition, that the remainder of mankind—fortunately the majority—however marked by strange infirmities, hobbies, crotchets, or uncontrollable passions, do possess a property of solidity which insures them pretty well against ever becoming fit inmates for the asylum. Yet it must be owned that the distinctions are sometimes a little obscure, and that one occasionally meets with persons deemed fit to be at large for whom it might be as well that they were shut up, and likewise with persons who, if not in the ordinary strain of their life, yet in some particular crisis, act with such a disregard of common sense, that to suspect them of at least a temporary insanity might not merely be justifiable, but lenient.

If, indeed, we take one by one the ordinary marks of insanity, as defined by physicians, we shall find that nearly all of them may be attributed to certain persons reputedly sane.

It is, for example, a strong trait of the insane that their affections become perverted or depraved. They take up causeless antipathies to their nearest relations, with whom they have lived up to that time in perfect amity. Now, we assuredly see instances of nearly the same peculiarity in the portion of mankind which remains at large. We once knew something of a gentleman of fortune who was not without either talents or good feelings, but who contracted, for no apparent cause, and maintained for a long course of years, a hatred of his children. He kept them all at a distance from him, gave them nothing which the law would permit him to keep from them, and did not allow even the deathbed of one of them to soften his rabid antipathy. We have known several other parents of both sexes who had what appeared a morbid dislike of their children, and yet no one ever dreamed of their being unfit to manage their own affairs.

Another feature of the confessedly insane is a dispo-

sition to act under what appear inadequate motives, or with scarcely any recognisable motive at all. There is a striking absurdity in the object they seek after, and an irrelevancy in their way of attaining it. With headlong zeal they pursue things and follow practices which appear indifferent, or incapable of producing any serious benefit; perhaps, with a good course before them, they deliberately enter upon a wrong one, where destruction lies in wait to swallow them up. But is not this a tolerably correct description of the conduct of no small part of the world at large?

A gentleman of reputed sanity knows perfectly well, as most people know, that it is the property of much wine to brutalise, to produce present and future pain, and to disorganise the whole course of a decorous and prosperous existence. Yet with this knowledge, and for no reason which can be made appreciable by the bulk of mankind, he deliberately submits himself to this degradation, misery, and ruin. The gamester knows equally well how fickle a patroness is Fortune, and what traps and pitfalls beset all her paths. Yet we shall see him going day after day, with a collected mind and in a steady pace, to spend his precious hours at her table. Motive, object, design, are here manifestly vile and contemptible; and the fatal tendency is fully presented to view. How could the conduct of lunatics in any point of view be worse?

A gentleman has inherited or otherwise become possessed of a handsome income, which, with fair economy, is fitted to maintain himself and his family in comfort all his life, besides enabling him to make some provision for those dependent upon him. But, instead of living in rational comfort within his income, he launches into a course of vanity and extravagance, such as twice the revenue would scarcely have sufficed to support. Now the end of such a career is well ascertained. The time when it will occur can be calculated upon. The kind of life which will ensue when the patient has fallen into the hands of creditors is clearly seen in the previous experience of multitudes who walk about, objects of pity, talking of their embarrassments when they should rather confess their frauds. And yet our victim will go deliberately on to the fatal abyss, as if he were under some delusion as to the number of twos which there are in four, or supposed himself by some magic sleight exempted from the ordinary laws of our social economy. In what respect can we say that such a person is to be distinguished from a lunatic? His conduct seems as destitute of adequate motive as that of any madman, and he appears as reckless of consequences. Yet how many people, of passable repute in society, live in this manner—while they can!

A mercantile man had realised a handsome fortune

by his industry, and saw himself at forty-five enabled to retire to his native district, to purchase an estate there, and commence an elegant course of life, while scores of his former associates were obliged still to continue in the turmoil and racking anxieties of business, with but a poor chance of coming off half so well after a much longer perseverance in their respective concerns. This man, so rarely blest in the mercantile sense of the word, lived very happily for a short time in his new place; but by and by he had accomplished all the improvements in his residence which the utmost ingenuity could suggest; he had seen all the new faces around him, and exhausted all the ordinary kinds of social enjoyment within his reach. He was not without a taste for country sports; but they did not satisfy him. In time, he began to find his hours of leisure hang heavy upon his hands. His active spirit, formerly expended in trading speculation, now turned in upon and tormented himself. Just at that time a mercantile relative sought his co-operation in some trading schemes; and, unable to resist the temptation, he once more embarked in business, though only designing to devote to it a portion of his time. Very soon the exigencies of his new concern drew him wholly back into a life of business, and engrossed all his available resources. The reader foresees the end. Ere many years had elapsed, this worthy but restless man had lost the whole of his fortune, and found himself, in his declining days, obliged to work harder for a decent subsistence than it was necessary to do in his youth for a fortune. We must pity and deplore the fate of such a man; but it must be acknowledged that between the motivelessness of his conduct, and the either no-motive or inadequate motive of a lunatic, it is difficult to draw any distinction.

We remember seeing a story in an old book to something like the following purport:—A gentleman of fortune visited a lunatic asylum, where the treatment consisted chiefly of forcing the patients to stand in tubs of cold water, those slightly affected up to the knees; others, whose cases were graver, up to the middle; while persons very seriously ill were immersed up to the neck. The visitor entered into conversation with one of the patients, who appeared to have some curiosity to know how the stranger passed his time out of doors.

'I have horses and greyhounds for coursing,' said the latter in reply to the other's question.

'Ah! these are very expensive.'

'Yes; they cost me a great deal of money in the year, but they are the best of their kind.'

'Have you anything more?'

'Yes; I have a pack of hounds for hunting the fox.'

'And they cost a great deal too?'

'A very great deal. And I have birds for hawking.'

'I see: birds for hunting other birds. And these swell up the expense, I daresay?'

'You may say that, for they are not common in this country. And then I sometimes go out alone with my gun, accompanied by a setter and a retriever.'

'And these are expensive too?'

'Of course. After all, it is not the animals of themselves that run away with the money: there must be men, you know, to feed and look after them, houses to lodge them in—in short, the whole sporting establishment.'

'I see, I see. You have horses, hounds, setters, retrievers, hawks, men—and all for the capture of foxes and birds. What an enormous revenue they must cost

you! Now, what I want to know is this, what return do they pay?—what does your year's sporting produce?'

'Why, we kill a fox now and then—only they are getting rather scarce hereabouts—and we seldom bag less than fifty brace of birds each season.'

'Hark!' said the lunatic, looking anxiously round him. 'My friend'—in an earnest whisper—'there is the gate behind you; take my advice, and be off out of this place while you are safe. Don't let the doctor get his eyes upon you. He ducks us to some purpose, but, as sure as you are a living man, he will half-drown you!'

As to this gentleman's case, we may be told that there is a motive quite intelligible for his conduct. He desires amusement; this course of life amuses him, therefore he adopts it. It may even be said that in point of expense he is fully justifiable; it is a matter on which he is entitled to judge for himself. We would say, on the other hand, that a man's amusements ought to be rational, and that there should be some fair proportion between the amusement and the expense, according to the common ideas of mankind. The amusement is at once too trivial and too expensive to meet the ordinary ideas of men, and therefore it may very reasonably be brought into contrast with the recognised lunacies.

It strikes us that there is a still stronger mark of true insanity in the tendency to attach a false importance to things, or to disproportion, as it were, the emotions to the objects by which they are excited. And yet it cannot be said that this tendency is confined to the insane. The whole theatre of the reputedly-sane world is full of cases of this kind of absurdity. Each person sees it in his neighbours, while failing to detect it in himself. In creeds and religious practices particularly, how multiform the illusions and fanaticisms, leading to the most preposterous conduct, and to the violation of the finest social affections, while all the time the dictates of 'religion pure and undefiled' are trampled under foot and forgotten. If we calmly view the manias which from time to time arise in this department of human affairs, we shall certainly be at a loss to distinguish them from many of the errors of the diseased brain. Look again at the paroxysms of mercantile speculation which occasionally take place. A frantic inclination to 'invest' suddenly takes possession of a large portion of the public. Attaching an importance to wealth far beyond the reality, and blind to hazard, men lay out their hard earnings in some promising scheme—may, are delighted when their money is taken off their hands, as if its being left there were the losing of some golden opportunity. Now, men know that it is dangerous to hasten to be rich, and that to think of attaining wealth otherwise than by hard work, diligence, and frugality, is in ordinary circumstances folly. Yet no such knowledge controls or checks them, until they are awakened to the deplorable issue which alone could be reasonably expected from such extravagance. We were going to say that it certainly is difficult to separate these investing manias from downright lunacy; but we pause on reflecting that, if we were to step from the stock exchange into the nearest lunatic asylum, we should probably find it a transition from something like insane *foresight* to the calm of philosophic contemplation. The contrast here is in favour of the world under restraint.

Amongst the best recognised of the insanities are those which have their root each in some special passion. One gentleman is mad with pride, and, considering himself a king, is indignant that his fellow-patients do not pay homage to him. Another, whose wonder (speaking the language of phrenology) is deranged, labours under a delusion which gives a belief in false miracles, in prodigies, magic, ghosts, and all supernatural absurdities. A third is under the influence of an

infatuated firmness; and so on. Now, all of these errors are to be broadly seen on the face of walk-about society. Our friend Superbus is noted for the ridiculously-high estimate he puts upon himself. The sane society of London to this day, and at this day, supports half-a-dozen astrologers, and keeps up an astrological literature. And have we not seen sovereigns lose their thrones, and send their posterity into exile and humiliation, rather than give in to some reasonable demand of their subjects? We might go over all the lunacies of the emotions in the same manner, and throughout the entire gamut it would be found that each note of the declaredly-insane mind has its responsive chord in that of the world at large.

It should not be overlooked, in reference to this subject, that there is a great number of people who appear almost devoid of all such erratic character as can be, by any stretch of ingenuity, likened to insanity, and who accordingly bear the repute of being remarkably sound-headed, prudent, considerate, well-tempered people; and yet it often comes out regarding such persons, that they have all the time in their inner life cherished some strange Delilah of the imagination, some foolish hope or prospect, or some fond illusive estimate of themselves, such as their fellow-creatures can by no means approve of, and which makes them in fact no better in respect of the unacknowledged lunacies than their neighbours. There is a great amount of masked imagination and unconfessed day-dreaming amongst mankind. The tamest-looking people often have silent volcanoes rending them within. In the shadiest and modestest nooks of life, the lifting off of the upper integuments would be found to lay bare throes and fervours of the bosom such as ought only to exist in the confessedly insane. If all this be taken into account, the approximation of the world at large to the world shut up will appear still more clearly established.

We have often bethought us how desirable it is that there should be some treatment for the unrecognised infatuations. It is truly a sore pity to see a perhaps worthy man exposing himself to ruin or disgrace through a mad course of conduct—a gentleman of sixty, for instance, marrying a girl of sixteen, whom he thinks in love with him, and capable of making him a good wife—if a little interference of any kind on the part of rational bystanders could save him. We have cogitated a thousand plans for saving the unconfined insane from themselves; but a thousand difficulties rise in the path. One consideration nearly settles the matter. It is difficult enough to conclude about the cases which require confinement, and sometimes mistakes are made by the acutest magistrates and doctors. How much more difficult to legislate for those honest people who go rationally about most of their business, and are only possessed by some fragment of an evil spirit, or become liable at some particular crisis to act in defiance of rationality! Perhaps the only thing that can be done, is to try to impress the world at large with the idea that it is not more than enough entitled to be so, and to call upon individuals, when inclined to start into any extraordinary course, to reflect that they are perhaps about to rival the doings of the world in confinement. To be fully aware of this universal liability to a certain shade of derangement would do us all some good, in acting as a warning. To remember, when about to do some headlong passionate thing, that we have seen such actions characterised as the effects of a transient madness, might help to change our hand and check our pride. It seems quite possible, moreover, for a gentleman who goes mad for gambling, for drink, or any other kind of vice, or for one of those in whom the love of sport is carried to frenzy, to be made aware that he might, under a better direction for his faculties, derive equal enjoyment from their exercise, and be doing good to

himself and his fellow-creatures all the time—for of course it is the excitement of occupation which such men require, and this they may obtain innocently and safely as well as otherwise.

REMINISCENCES OF AN ATTORNEY.

THE CHEST OF DRAWERS.

I AM about to relate a rather curious piece of domestic history, some of the incidents of which, revealed at the time of their occurrence in contemporary law reports, may be in the remembrance of many readers. It took place in one of the midland counties, and at a place which I shall call Watley: the names of the chief actors who figured in it must also, to spare their modesty or their blushes, as the case may be, be changed; and should one of those persons, spite of these precautions, apprehend unpleasant recognition, he will be able to console himself with the reflection, that all I state beyond that which may be gathered from the records of the law courts will be generally ascribed to the fancy or invention of the writer. And it is as well, perhaps, that it should be so.

Caleb Jennings, a shoemaker, cobbler, snob—using the last word in its genuine classical sense, and by no means according to the modern interpretation by which it is held to signify a genteel sneak or pretender—he was anything but that—occupied, some twelve or thirteen years ago, a stall at Watley, which, according to the traditions of the place, had been hereditary in his family for several generations. He may also be said to have flourished there, after the manner of cobblers; for this, it must be remembered, was in the good old times, before the gutta-percha revolution had carried ruin and dismay into the stalls—those of cobblers—which in considerable numbers existed throughout the kingdom. Like all his fraternity whom I have ever fallen in with or heard of, Caleb was a sturdy Radical of the Major Cartwright and Henry Hunt school; and being withal industrious, tolerably skilful, not inordinately prone to the observance of Saint Mondays, possessed, moreover, of a neatly-furnished sleeping and eating apartment in the house of which the projecting first floor, supported on stone pillars, overshadowed his humble workplace, he vaunted himself to be as really rich as an estated squire, and far more independent.

There was some truth in this boast, as the case which procured us the honour of Mr Jennings's acquaintance sufficiently proved. We were employed to bring an action against a wealthy gentleman of the vicinity of Watley for a brutal and unprovoked assault he had committed, when in a state of partial inebriety, upon a respectable London tradesman who had visited the place on business. On the day of trial our witnesses appeared to have become suddenly afflicted with an almost total loss of memory; and we were only saved from an adverse verdict by the plain, straightforward evidence of Caleb, upon whose sturdy nature the various arts which soften or neutralise hostile evidence had been tried in vain. Mr Flint, who personally superintended the case, took quite a liking to the man; and it thus happened that we were called upon some time afterwards to aid the said Caleb in extricating himself from the extraordinary and perplexing difficulty in which he suddenly and unwittingly found himself involved.

The projecting first floor of the house beneath which the humble workshop of Caleb Jennings modestly disclosed itself, had been occupied for many years by an ailing and somewhat aged gentleman of the name of Lisle. This Mr Ambrose Lisle was a native of Watley, and had been a prosperous merchant of the city of London. Since his return, after about twenty years' absence, he had shut himself up in almost total seclusion, nourishing a cynical bitterness and acrimony of temper which gradually withered up the sources of

health and life, till at length it became as visible to himself as it had for some time been to others, that the oil of existence was expended, burnt up, and that but a few weak flickers more, and the ailing man's plaints and griefs would be hushed in the dark silence of the grave.

Mr Lisle had no relatives at Watley, and the only individual with whom he was on terms of personal intimacy was Mr Peter Sowerby, an attorney of the place, who had for many years transacted all his business. This man visited Mr Lisle most evenings, played at chess with him, and gradually acquired an influence over his client which that weak gentleman had once or twice feebly but vainly endeavoured to shake off. To this clever attorney, it was rumoured, Mr Lisle had bequeathed all his wealth.

This piece of information had been put in circulation by Caleb Jennings, who was a sort of humble favourite of Mr Lisle's, or, at all events, was regarded by the misanthrope with less dislike than he manifested towards others. Caleb cultivated a few flowers in a little plot of ground at the back of the house, and Mr Lisle would sometimes accept a rose or a bunch of violets from him. Other slight services—especially since the recent death of his old and garrulous woman-servant, Esther May, who had accompanied him from London, and with whom Mr Jennings had always been upon terms of gossiping intimacy—had led to certain familiarities of intercourse; and it thus happened that the inquisitive shoe-mender became partially acquainted with the history of the wrongs and griefs which preyed upon, and shortened the life of, the prematurely-aged man.

The substance of this everyday, commonplace story, as related to us by Jennings, and subsequently enlarged and coloured from other sources, may be very briefly told.

Ambrose Lisle, in consequence of an accident which occurred in his infancy, was slightly deformed. His right shoulder—as I understood, for I never saw him—grew out, giving an ungraceful and somewhat comical twist to his figure, which, in female eyes—youthful ones at least—sadly marred the effect of his intelligent and handsome countenance. This personal defect rendered him shy and awkward in the presence of women of his own class of society; and he had attained the ripe age of thirty-seven years, and was a rich and prosperous man, before he gave the slightest token of an inclination towards matrimony. About a twelvemonth previous to that period of his life, the deaths—quickly following each other—of a Mr and Mrs Stevens threw their eldest daughter, Lucy, upon Mr Lisle's hands. Mr Lisle had been left an orphan at a very early age, and Mrs Stevens—his aunt, and then a maiden lady—had, in accordance with his father's will, taken charge of himself and brother till they severally attained their majority. Long, however, before that she married Mr Stevens, by whom she had two children—Lucy and Emily. Her husband, whom she survived but two months, died insolvent; and in obedience to the dying wishes of his aunt, for whom he appears to have felt the tenderest esteem, he took the eldest of her orphan children to his home, intending to regard and provide for her as his own adopted child and heiress. Emily, the other sister, found refuge in the house of a still more distant relative than himself.

The Stevenses had gone to live at a remote part of England—Yorkshire, I believe—and it thus fell out, that till his cousin Lucy arrived at her new home he had not seen her for more than ten years. The pale, and somewhat plain child, as he had esteemed her, he was startled to find had become a charming woman; and her naturally gay and joyous temperament, quick talents, and fresh young beauty, rapidly acquired an overwhelming influence over him. Strenuously but vainly he struggled against the growing infatuation—

argued, reasoned with himself—passed in review the insurmountable objections to such a union, the difference of age—he leading towards thirty-seven, she barely twenty-one: he, crooked, deformed, of reserved, taciturn temper—she full of young life, and grace, and beauty. It was useless; and nearly a year had passed in the bootless struggle when Lucy Stevens, who had vainly striven to blind herself to the nature of the emotions by which her cousin and guardian was animated towards her, intimated a wish to accept her sister Emily's invitation to pass two or three months with her. This brought the affair to a crisis. Buoying himself up with the illusions which people in such an unreasonable frame of mind create for themselves, he suddenly entered the sitting-room set apart for her private use, with the desperate purpose of making his beautiful cousin a formal offer of his hand. She was not in the apartment, but her opened writing-desk, and a partly-finished letter lying on it, shewed that she had been recently there, and would probably soon return. Mr Lisle took two or three agitated turns about the room, one of which brought him close to the writing-desk, and his glance involuntarily fell upon the unfinished letter. Had a deadly serpent leaped suddenly at his throat, the shock could not have been greater. At the head of the sheet of paper was a clever pen-and-ink sketch of Lucy Stevens and himself: he, kneeling to her in a love-lorn ludicrous attitude, and she laughing immoderately at his lachrymose and pitiful aspect and speech. The letter was addressed to her sister Emily; and the enraged lover saw not only that his supposed secret was fully known, but that he himself was mocked, laughed at for his doting folly. At least this was his interpretation of the words which swam before his eyes. At the instant Lucy returned, and a torrent of imprecation burst from the furious man, in which wounded self-love, rageful pride, and long pent-up passion, found utterance in wild and bitter words. Half an hour afterwards Lucy Stevens had left the merchant's house—for ever, as it proved. She, indeed, on arriving at her sister's, sent a letter supplicating forgiveness for the thoughtless, and, as he deemed it, insulting sketch, intended only for Emily's eye; but he replied merely by a note written by one of his clerks, informing Miss Stevens that Mr Lisle declined any further correspondence with her.

The ire of the angered and vindictive man had, however, begun sensibly to abate, and old thoughts, memories, duties, suggested partly by the blank which Lucy's absence made in his house, partly by remembrance of the solemn promise he had made her mother, were strongly reviving in his mind, when he read the announcement of her marriage in a provincial journal, directed to him, as he believed, in the bride's handwriting; but this was an error, her sister having sent the newspaper. Mr Lisle also construed this into a deliberate mockery and insult, and from that hour strove to banish all images and thoughts connected with his cousin from his heart and memory.

He unfortunately adopted the very worst course possible for effecting this object. Had he remained amid the buzz and tumult of active life, a mere sentimental disappointment, such as thousands of us have sustained and afterwards forgotten, would, there can be little doubt, have soon ceased to afflict him. He chose to retire from business, visited Watley, and habits of miserliness growing rapidly upon his cankered mind, never afterwards removed from the lodgings he had hired on first arriving there. Thus madly hugging to himself sharp-pointed memories which a sensible man would have speedily cast off and forgotten, the poor misanthrope passed a useless, cheerless, weary existence, to which death must have been a welcome relief.

Matters were in this state with the morose and aged man—aged mentally and corporeally, although his years were but fifty-eight—when Mr Flint made Mr Jennings

acquaintance. Another month or so had passed away when Caleb's attention was one day about noon claimed by a young man dressed in mourning, accompanied by a female similarly attired, and from their resemblance to each other he conjectured brother and sister. The stranger wished to know if that was the house in which Mr Ambrose Lisle resided. Jennings said it was; and with civil alacrity left his stall and rang the front-door bell. The summons was answered by the landlady's servant, who, since Esther May's death, had waited on the first-floor lodger; and the visitors were invited to go up stairs. Caleb, much wondering who they might be, returned to his stall, and from thence passed into his eating and sleeping room just below Mr Lisle's apartments. He was in the act of taking a pipe from the mantel-shelf, in order to the more deliberate and satisfactory cogitation on such an unusual event, when he was startled by a loud shout, or scream rather, from above. The quivering and excited voice was that of Mr Lisle, and the outcry was immediately followed by an explosion of unintelligible exclamations from several persons. Caleb was up stairs in an instant, and found himself in the midst of a strangely-perplexing and distracted scene. Mr Lisle, pale as his shirt, shaking in every limb, and his eyes on fire with passion, was hurling forth a torrent of vituperation and reproach at the young woman, whom he evidently mistook for some one else; whilst she, extremely terrified, and unable to stand but for the assistance of her companion, was tendering a letter in her outstretched hand, and uttering broken sentences, which her own agitation and the fury of Mr Lisle's invectives rendered totally incomprehensible. At last the fierce old man struck the letter from her hand, and with frantic rage ordered both the strangers to leave the room. Caleb urged them to comply, and accompanied them down stairs. When they reached the street, he observed a woman on the other side of the way, dressed in mourning, and much older apparently, though he could not well see her face through the thick veil she wore, than she who had thrown Mr Lisle into such an agony of rage, apparently waiting for them. To her the young people immediately hastened, and after a brief conference the three turned away up the street, and Mr Jennings saw no more of them.

A quarter of an hour afterwards the house-servant informed Caleb that Mr Lisle had retired to bed, and although still in great agitation, and, as she feared, seriously indisposed, would not permit Dr Clarke to be sent for. So sudden and violent a hurricane in the usually dull and drowsy atmosphere in which Jennings lived, excited and disturbed him greatly: the hours, however, flew past without bringing any relief to his curiosity, and evening was falling, when a peculiar knocking on the floor overhead announced that Mr Lisle desired his presence. That gentleman was sitting up in bed, and in the growing darkness his face could not be very distinctly seen; but Caleb instantly observed a vivid and unusual light in the old man's eyes. The letter so strangely delivered was lying open before him; and unless the shoemaker was greatly mistaken, there were stains of recent tears upon Mr Lisle's furrowed and hollow cheeks. The voice, too, it struck Caleb, though eager, was gentle and wavering. 'It was a mistake, Jennings,' he said; 'I was mad for the moment. Are they gone?' he added in a yet more subdued and gentle tone. Caleb informed him of what he had seen; and as he did so, the strange light in the old man's eyes seemed to quiver and sparkle with a yet intenser emotion than before. Presently he shaded them with his hand, and remained several minutes silent. He then said with a firmer voice: 'I shall be glad if you will step to Mr Sowerby, and tell him I am too unwell to see him this evening. But be sure to say nothing else,' he eagerly added, as Caleb turned away in compliance with his request; 'and when you come back, let me see you again.'

When Jennings returned, he found to his great surprise Mr Lisle up and nearly dressed; and his astonishment increased a hundredfold upon hearing that gentleman say, in a quick but perfectly collected and decided manner, that he should set off for London by the mail-train.

'For London—and by night!' exclaimed Caleb, scarcely sure that he heard aright.

'Yes—yes, I shall not be observed in the dark,' sharply rejoined Mr Lisle; 'and you, Caleb, must keep my secret from everybody, especially from Sowerby. I shall be here in time to see him to-morrow night, and he will be none the wiser.' This was said with a slight chuckle; and as soon as his simple preparations were complete, Mr Lisle, well wrapped up, and his face almost hidden by shawls, locked his door, and assisted by Jennings, stole furtively down stairs, and reached unrecognised the railway station just in time for the train.

It was quite dark the next evening when Mr Lisle returned; and so well had he managed, that Mr Sowerby, who paid his usual visit about half an hour afterwards, had evidently heard nothing of the suspicious absence of his esteemed client from Watley. The old man exulted over the success of his deception to Caleb the next morning, but dropped no hint as to the object of his sudden journey.

Three days passed without the occurrence of any incident tending to the enlightenment of Mr Jennings upon these mysterious events, which, however, he plainly saw had lamentably shaken the long-since failing man. On the afternoon of the fourth day, Mr Lisle walked, or rather tottered, into Caleb's stall, and seated himself on the only vacant stool it contained. His manner was confused, and frequently purposeless, and there was an anxious, flurried expression in his face which Jennings did not at all like. He remained silent for some time, with the exception of partially inaudible snatches of comment or questionings, apparently addressed to himself. At last he said: 'I shall take a longer journey to-morrow, Caleb—much longer: let me see—where did I say? Ah, yes! to Glasgow; to be sure to Glasgow!'

'To Glasgow, and to-morrow!' exclaimed the astounded cobbler.

'No, no—not Glasgow; they have removed,' feebly rejoined Mr Lisle. 'But Lucy has written it down for me. True—true; and to-morrow I shall set out.'

The strange expression of Mr Lisle's face became momentarily more strongly marked, and Jennings, greatly alarmed, said: 'You are ill, Mr Lisle; let me run for Dr Clarke.'

'No—no,' he murmured, at the same time striving to rise from his seat, which he could only accomplish by Caleb's assistance, and so supported, he staggered indoors. 'I shall be better to-morrow,' he said faintly, and then slowly added: 'To-morrow, and to-morrow, and to-morrow! Ah, me! Yes, as I said, to-morrow, I'—He paused abruptly, and they gained his apartment. He seated himself, and then Jennings, at his mute solicitation, assisted him to bed.

He lay some time with his eyes closed; and Caleb could feel—for Mr Lisle held him firmly by the hand, as if to prevent his going away—a convulsive shudder pass over his frame. At last he slowly opened his eyes, and Caleb saw that he was indeed about to depart upon the long journey from which there is no return. The lips of the dying man worked inarticulately for some moments; and then with a mighty effort, as it seemed, he said, whilst his trembling hand pointed feebly to a bureau chest of drawers that stood in the room: 'There—there, for Lucy; there, the secret place is'—Some inaudible words followed, and then after a still mightier struggle than before, he gasped out: 'No word—no word—to—Sowerby—for her—Lucy.'

More was said, but undistinguishable by mortal ear; and after gazing with an expression of indescribable

anxiety in the scared face of his awestruck listener, the wearied eyes slowly reclosed—the deep silence flowed past; then the convulsive shudder came again, and he was dead!

Caleb Jennings tremblingly summoned the house-servant and the landlady, and was still confusedly pondering the broken sentences uttered by the dying man, when Mr Sowerby hurriedly arrived. The attorney's first care was to assume the direction of affairs, and to place seals upon every article containing or likely to contain anything of value belonging to the deceased. This done, he went away to give directions for the funeral, which took place a few days afterwards; and it was then formally announced that Mr Sowerby succeeded by will to the large property of Ambrose Lisle; under trust, however, for the family, if any, of Robert Lisle, the deceased's brother, who had gone when very young to India, and had not been heard of for many years—a condition which did not at all mar the joy of the crafty lawyer, he having long since instituted private inquiries, which perfectly satisfied him that the said Robert Lisle had died, unmarried, at Calcutta.

Mr Jennings was in a state of great dubiety and consternation. Sowerby had emptied the chest of drawers of every valuable it contained; and unless he had missed the secret receptacle Mr Lisle had spoken of, the deceased's intentions, whatever they might have been, were clearly defeated. And if he had not discovered it, how could he, Jennings, get at the drawers to examine them? A fortunate chance brought some relief to his perplexities. Ambrose Lisle's furniture was advertised to be sold by auction, and Caleb resolved to purchase the bureau chest of drawers at almost any price, although to do so would oblige him to break into his rent-money, then nearly due. The day of sale came, and the important lot in its turn was put up. In one of the drawers there were a number of loose newspapers, and other valueless scraps; and Caleb, with a sly grin, asked the auctioneer if he sold the article with all its contents. 'Oh yes,' said Sowerby, who was watching the sale; 'the buyer may have all it contains over his bargain, and much good may it do him.' A laugh followed the attorney's sneering remark, and the biddings went on. 'I want it,' observed Caleb, 'because it just fits a recess which this one in my room underneath.' This he said to quiet a suspicion he thought he saw gathering upon the attorney's brow. It was finally knocked down to Caleb at L.5, 10s., a sum considerably beyond its real value; and he had to borrow a sovereign in order to clear his speculative purchase. This done, he carried off his prize, and as soon as the closing of the house for the night secured him from interruption, he set eagerly to work in search of the secret drawer. A long and patient examination was richly rewarded. Behind one of the small drawers of the *secrétaire* portion of the piece of furniture was another small one, curiously concealed, which contained Bank-of-England notes to the amount of L.200, tied up with a letter, upon the back of which was written, in the deceased's handwriting, 'To take with me.' The letter which Caleb, although he read print with facility, had much difficulty in making out, was that which Mr Lisle had struck from the young woman's hand a few weeks before, and proved to be a very affecting appeal from Lucy Stevens, now Lucy Warner, and a widow, with two grown-up children. Her husband had died in insolvent circumstances, and she and her sister Emily, who was still single, were endeavouring to carry on a school at Bristol, which promised to be sufficiently prosperous if the sum of about L.150 could be raised, to save the furniture from her deceased husband's creditors. The claim was pressing, for Mr Warner had been dead nearly a year, and Mr Lisle being the only relative Mrs Warner had in the world, she had ventured to entreat his assistance for her mother's sake. There could be no moral doubt, therefore, that this money

was intended for Mrs Warner's relief; and early in the morning Mr Caleb Jennings dressed himself in his Sunday's suit, and with a brief announcement to his landlady that he was about to leave Watley for a day or two on a visit to a friend, set off for the railway station. He had not proceeded far when a difficulty struck him: the bank-notes were all twenties; and were he to change a twenty-pound note at the station, where he was well known, great would be the tattle and wonderment, if nothing worse, that would ensue. So Caleb tried his credit again, borrowed sufficient for his journey to London, and there changed one of the notes.

He soon reached Bristol, and blessed was the relief which the sum of money he brought afforded Mrs Warner. She expressed much sorrow for the death of Mr Lisle, and great gratitude to Caleb. The worthy man accepted with some reluctance one of the notes, or at least as much as remained of that which he had changed; and after exchanging promises with the widow and her relatives to keep the matter secret, departed homewards. The young woman, Mrs Warner's daughter, who had brought the letter to Watley, was, Caleb noticed, the very image of her mother, or rather of what her mother must have been when young. This remarkable resemblance it was, no doubt, which had for the moment so confounded and agitated Mr Lisle.

Nothing occurred for about a fortnight after Caleb's return to disquiet him, and he had begun to feel tolerably sure that his discovery of the notes would remain unsuspected, when, one afternoon, the sudden and impetuous entrance of Mr Sowerby into his stall caused him to jump up from his seat with surprise and alarm. The attorney's face was deathly white, his eyes glared like a wild beast's, and his whole appearance exhibited uncontrollable agitation. 'A word with you, Mr Jennings,' he gasped—'a word in private, and at once!' Caleb, in scarcely less consternation than his visitor, led the way into his inner room, and closed the door.

'Restore—give back,' screamed the attorney, vainly struggling to dissemble the agitation which convulsed him—'that—that which you have purloined from the chest of drawers!'

The hot blood rushed to Caleb's face and temples; the wild vehemence and suddenness of the demand confounded him; and certain previous dim suspicions that the law might not only pronounce what he had done illegal, but possibly felonious, returned upon him with terrible force, and he quite lost his presence of mind.

'I can't—I can't,' he stammered. 'It's gone—given away!'

'Gone!' shouted, or more correctly howled, Sowerby, at the same time flying at Caleb's throat as if he would throttle him. 'Gone—given away! You lie—you want to drive a bargain with me—dog!—liar!—rascal!—thief!'

This was a species of attack which Jennings was at no loss how to meet. He shook the attorney roughly off, and hurled him, in the midst of his vituperation, to the further end of the room.

They then stood glaring at each other in silence, till the attorney, mastering himself as well as he could, essayed another and more rational mode of attaining his purpose.

'Come, come, Jennings,' he said, 'don't be a fool. Let us understand each other. I have just discovered a paper, a memorandum of what you have found in the drawers, and to obtain which you bought them. I don't care for the money—keep it; only give me the papers—documents.'

'Papers—documents!' ejaculated Caleb in unfeigned surprise.

'Yes—yes; of use to me only. You, I remember, cannot read writing; but they are of great consequence to me—to me only, I tell you.'

'You can't mean Mrs Warner's letter?'

'No—no; curse the letter! You are playing with a tiger! Keep the money, I tell you; but give up the papers—documents—or I'll transport you!' shouted Sowerby with reviving fury.

Caleb, thoroughly bewildered, could only mechanically ejaculate that he had no papers or documents.

The rage of the attorney when he found he could extract nothing from Jennings was frightful. He literally foamed with passion, uttered the wildest threats; and then suddenly changing his key, offered the astounded cobbler one—two—three thousand pounds: any sum he chose to name, for the papers—documents! This scene of alternate violence and cajolery lasted nearly an hour; and then Sowerby rushed from the house, as if pursued by the furies, and leaving his auditor in a state of thorough bewilderment and dismay. It occurred to Caleb, as soon as his mind had settled into something like order, that there might be another secret drawer; and the recollection of Mr Lisle's journey to London recurred suggestively to him. Another long and eager search, however, proved fruitless; and the suspicion was given up, or, more correctly, weakened.

As soon as it was light the next morning, Mr Sowerby was again with him. He was more guarded now, and was at length convinced that Jennings had no paper or document to give up. 'It was only some important memoranda,' observed the attorney carelessly, 'that would save me a world of trouble in a lawsuit I shall have to bring against some heavy debtors to Mr Lisle's estate; but I must do as well as I can without them. Good-morning.' Just as he reached the door, a sudden thought appeared to strike him. He stopped, and said: 'By the way, Jennings, in the hurry of business I forgot that Mr Lisle had told me the chest of drawers you bought, and a few other articles, were family relics which he wished to be given to certain parties he named. The other things I have got; and you, I suppose, will let me have the drawers for—say a pound profit on your bargain?'

Caleb was not the acutest man in the world; but this sudden proposition, carelessly as it was made, suggested curious thoughts. 'No,' he answered; 'I shall not part with it. I shall keep it as a memorial of Mr Lisle.'

Sowerby's face assumed, as Caleb spoke, a ferocious expression. 'Shall you?' said he. 'Then be sure, my fine fellow, that you shall also have something to remember me by as long as you live!'

He then went away, and a few days afterwards Caleb was served with a writ for the recovery of the two hundred pounds.

The affair made a great noise in the place; and Caleb's conduct being very generally approved, a subscription was set on foot to defray the cost of defending the action—one Hayling, a rival attorney to Sowerby, having asserted that the words used by the proprietor of the chest of drawers at the sale barred his claim to the money found in them. This wise gentleman was intrusted with the defence; and, strange to say, the jury—a common one—spite of the direction of the judge, returned a verdict for the defendant, upon the ground that Sowerby's jocular or sneering remark amounted to a serious, valid leave and licence to sell two hundred pounds for five pounds ten shillings!

Sowerby obtained, as a matter of course, a rule for a new trial; and a fresh action was brought. All at once Hayling refused to go on, alleging deficiency of funds. He told Jennings that in his opinion it would be better that he should give in to Sowerby's whim, who only wanted the drawers in order to comply with the testator's wishes. 'Besides,' remarked Hayling in conclusion, 'he is sure to get the article, you know, when it comes to be sold under a writ of *fi fa*.' A few days after this conversation, it was ascertained that

Hayling was to succeed to Sowerby's business, the latter gentleman being about to retire upon the fortune bequeathed him by Mr Lisle.

At last Caleb, driven nearly out of his senses, though still doggedly obstinate, by the harassing perplexities in which he found himself, thought of applying to us.

'A very curious affair, upon my word,' remarked Mr Flint, as soon as Caleb had unburdened himself of the story of his woes and cares; 'and in my opinion by no means explainable by Sowerby's anxiety to fulfil the testator's wishes. He cannot expect to get two hundred pence out of you; and Mrs Warner, you say, is equally unable to pay. Very odd indeed. Perhaps if we could get time, something might turn up.'

With this view Flint looked over the papers Caleb had brought, and found the declaration was in *trover*—a manifest error—the notes never admittedly having been in Sowerby's actual possession. We accordingly demurred to the form of action, and the proceedings were set aside. This, however, proved of no ultimate benefit: Sowerby persevered, and a fresh action was instituted against the unhappy shoemaker. So utterly overcrowded and disconsolate was poor Caleb, that he determined to give up the drawers, which was all Sowerby even now required, and so wash his hands of the unfortunate business. Previous, however, to this being done, it was determined that another thorough and scientific examination of the mysterious piece of furniture should be made; and for this purpose Mr Flint obtained a workman skilled in the mysteries of secret contrivances, from the desk and dressing-case establishment in King Street, Holborn, and proceeded with him to Watley.

The man performed his task with great care and skill: every depth and width was gauged and measured, in order to ascertain if there were any false bottoms or backs; and the workman finally pronounced that there was no concealed receptacle in the article.

'I am sure there is,' persisted Flint, whom disappointment as usual rendered but the more obstinate; 'and so is Sowerby; and he knows, too, that it is so cunningly contrived as to be undiscoverable, except by a person in the secret, which he no doubt at first imagined Caleb to be. I'll tell you what we'll do: You have the necessary tools with you. Split the confounded chest of drawers into shreds: I'll be answerable for the consequences.'

This was done carefully and methodically, but for some time without result. At length the large drawer next the floor had to be knocked to pieces; and as it fell apart, one section of the bottom, which, like all the others, was divided into two compartments, dropped asunder, and discovered a parchment laid flat between the two thin leaves, which, when pressed together in the grooves of the drawer, presented precisely the same appearance as the rest. Flint snatched up the parchment, and his eager eye had scarcely rested an instant on the writing, when a shout of triumph burst from him. It was the last will and testament of Ambrose Lisle, dated August 21, 1838—the day of his last hurried visit to London. It revoked the former will, and bequeathed the whole of his property, in equal portions, to his cousins Lucy Warner and Emily Stevens, with succession to their children; but with reservation of one-half to his brother Robert or children, should he be alive, or have left offspring.

Great, it may be supposed, was the jubilation of Caleb Jennings at this discovery; and all Watley, by his agency, was in a marvellously short space of time in a very similar state of excitement. It was very late that night when he reached his bed; and how he got there at all, and what precisely had happened, except, indeed, that he had somewhere picked up a splitting headache, was, for some time after he awoke the next morning, very confusedly remembered.

Mr Flint, upon reflection, was by no means so exul-

tant as the worthy shoemaker. The odd mode of packing away a deed of such importance, with no assignable motive for doing so, except the needless awe with which Sowerby was said to have inspired his feeble-spirited client, together with what Caleb had said of the shattered state of the deceased's mind after the interview with Mrs Warner's daughter, suggested fears that Sowerby might dispute, and perhaps successfully, the validity of this last will. My excellent partner, however, determined, as was his wont, to put a bold face on the matter; and first clearly settling in his own mind what he should and what he should not say, waited upon Mr Sowerby. The news had preceded him, and he was at once surprised and delighted to find that the nervous, crestfallen attorney was quite unaware of the advantages of his position. On condition of not being called to account for the moneys he had received and expended, about £1200, he destroyed the former will in Mr Flint's presence, and gave up at once all the deceased's papers. From these we learned that Mr Lisle had written a letter to Mrs Warner, stating what he had done, and where the will would be found, and that only herself and Jennings would know the secret. From infirmity of purpose, or from having subsequently determined on a personal interview, the letter was not posted; and Sowerby subsequently discovered it, together with a memorandum of the numbers of the bank-notes found by Caleb in the secret drawer—the eccentric gentleman appears to have had quite a mania for such hiding-places—of a writing-desk.

The affair was thus happily terminated: Mrs Warner, her children, and sister, were enriched, and Caleb Jennings was set up in a good way of business in his native place, where he still flourishes. Over the centre of his shop there is a large nondescript sign, surmounted by a golden boot, which, upon close inspection, is found to bear some resemblance to a huge bureau chest of drawers, all the circumstances connected with which may be heard, for the asking, and in much fuller detail than I have given, from the lips of the owner of the establishment, by any lady or gentleman who will take the trouble of a journey to Watley for that purpose.

A FAREWELL BANQUET.

WHEN lately in London we were favoured with an invitation to visit certain ships about to depart to the Canterbury Settlement in New Zealand, and to dine afterwards with a large party on the occasion of bidding farewell to the emigrant passengers setting out for that distant colony. The day was fine, and the sun shone forth brilliantly as we entered the extensive enclosure forming the East India import dock, where the vessels were moored. As regards this dock, it may be as well to explain that it does not resemble a harbour surrounded with houses, and involved in the confusion which one usually sees at ordinary quays. It is a piece of water with ample quays in a state of perfect repose, the whole, including a slip of green, environed by a lofty wall, within which no entrance is obtained except by well-guarded gateways. Any intending passengers, therefore, arriving within this enclosure may be quite at their ease; they are not exposed to that horrible din that pervades shipping places; and they go on board and make all their arrangements with the utmost deliberation.

On entering upon the spacious quadrangle, partly dock and partly green grass, we at once observed five vessels ranged along the nearest quay, decorated all over with flags; and with matted gangways reaching from the quay to the decks, so as to allow the freest ingress and egress. On the quay stood groups of ladies and gentle-

men chatting, and parties were walking into and out of the ships. On the green was a large wooden erection, with the union-jack hoisted on a pole at the doorway; and conspicuously at one end was a canvas tent, in which waiters were busily preparing the materials of refectory. A gardener's van was depositing flowers in pots to ornament the tables. A band of some regiment or no regiment was arriving and taking up a suitable position. As is always the case where anything is going on in London, there were plenty of police-officers to see that order was preserved. We gave only a look into the wooden structure. The struggle of arranging plates and glasses was considerable; but the chaos was not very alarming. Blackwall waiters possess a facility of arrangement in dining affairs, which allays all gastronomic apprehensions.

Having glanced round, at the *tout ensemble*, we proceeded to the ships, beginning with the first in the row, called the *Bangalore*. We found the deck pretty well covered with people—a mixture of visitors and emigrants. First we went into the poop, then descended a steepish but not particularly bad stair, to the deck below, where we had the presumption, in common with hundreds of others, to look into every hole and corner, and ask all sorts of odd questions. After this we remounted to the deck, and inspected in a critical way the pigs, the sheep, the fowls, the ducks, all of which seemed very cheery and comfortable in their respective bins; and lastly, we examined the cow, a most respectable-looking animal, standing in a roofed stall, and having before her a manger full of sweet-smelling hay, which she munched with a degree of satisfaction highly edifying. Poor cow! thought we you are going to be an involuntary emigrant, and never more will have the happiness of rolling about in the rich meadows of merry England. Well, well, it is to be hoped you will get across the line without being turned into beef, and live to crop daisies and cowslips, or something analogous to them, at the antipodes.

Most emigrant ships when about to sail present a dreadfully topsy-turvy aspect. Sailors are frantically pulling at ropes, and bawling down hatchways; the commander is full of troubles, and has not time to be civil; the state of affairs in what comes within the steward's department will not endure description. Sights, smells, sounds! The words are enough. No doubt the arrangements on board emigrant vessels have been recently much improved by the generally active supervision of government agents. Still, referring only to what may be daily seen at Liverpool and Glasgow, things are not quite what could be wished. Many emigrant ships are vessels employed in the timber or general import trade, and they seem to export or take away emigrants pretty much as a kind of ballast. In short, the emigration business with them is only a secondary or incidental consideration, not that primary object which, under a right system, it ought to be. A scene of scrambling on board one of these timber-trading emigrant vessels lately at the Broomielaw, Glasgow, has left a most unpleasant impression on our memory; and to this scene the spectacle that presented itself in the dock at Blackwall offered an agreeable contrast. Without disparaging other efforts in the same direction, we can at least say, that nothing in the nature of emigrant shipment which has come under our notice can be at all compared with the comfortable arrangements on board the vessels now starting for Canterbury. Nothing seemed to be done in a shabby, biggish-piggish way. Roomy and substantial, the vessels we visited were the pink of cleanliness and order.

The accommodation on board all the vessels was alike, or as nearly so as circumstances could admit, and was designed for three orders of persons, some-

what analogous to aristocracy, middle, and lower classes. The best kind of accommodation was in the poop. The poop, or cuddy, as it is sometimes called, is a large apartment like a dining-room, level with the deck, so that you walk into and out of it without going down stairs. It is situated in the after or hind-part of the vessel, and its roof, which we reach by a flight of steps, forms an agreeable place for walking or sitting in the open air. In hot weather an awning is drawn across, so as to avert the direct action of the sun. Sitting under this awning during fine weather, while the ship passes rapidly and smoothly through the water, is one of the most delightful things experienced in a long sea-voyage. The poop has two windows looking out on the deck, and on entering we find that along the sides there is a row of cabins, each having a door like a bedroom, and completely partitioned off from its neighbours. On the further side is a window of four small panes, opening on the side of the ship. In the *Bangalore* these cabins were capacious, and about eight feet high. Each could accommodate a bed, a small chest of drawers, a table, two chairs, and some other articles of furniture. One that we peeped into was provided with a shelf of books. Any person occupying a cabin of this class may be as retired as in his own house. All the occupants take their meals at a long mahogany table which runs up the middle of the cuddy. They are supposed to be the guests of the captain, and require to conduct themselves accordingly. At the end of the cuddy, near the entrance, is the pantry of the steward, who acts as waiter and general assistant. Such is the accommodation of what are styled poop passengers.

On the lower deck are the berths of an inferior kind. In that part of this lower deck which is beneath the poop are the chief cabins, as they are called, being the size of those above, and ranged in the same manner along the sides. The windows in them are considerably smaller; but to insure ventilation, the partitions do not reach the roof, therefore they are not quite so secluded as the upper cabins. Passengers who occupy these apartments take their meals up stairs with the residents in the poop, so, except when sleeping, they need not be much in the lower deck. All proper accommodations for cleanliness are attached to the suites of berths. Adjoining the chief cabins on the lower deck are the second-class cabins, which are similarly enclosed, and the occupants of which dine at a table appointed for them in this quarter.

So far, we believe, there is little difference between the arrangements of the vessels we refer to and those of ordinary emigrant ships from the principal ports. The novelty consists in what follows. On the same level as the second-class cabins, and running in continuation from them to the bow of the vessel, are the places appointed for the humbler class of passengers. These are of four varieties—berths for families, for married couples, for unmarried men, and for unmarried women. The berths for families are cabins with doors, not differing materially from the cabins of the second-class. The berths for married couples are enclosed spaces in two tiers; the space for a couple being three feet six inches wide, or thereabouts, and the same in height. The only opening is at the end; so that the occupants may be said to crawl into bed by the foot. Curtains may be hung in front. Nearer the bow, there are on one side, in a secluded situation, the berths distinctly set apart for young women; in a similar recess on the opposite side are the berths for men. In certain small cabins in the line of berths suitable accommodations for cleanliness are provided for the use of both sexes respectively. Wooden seats run along the fronts of the berths, and in the middle is fixed a deal-table, with a form on each side. Here all the third-class passengers dine, and are ordinarily seated—women sewing, men reading, and children amusing themselves.

This general apartment is lighted at the centre by the hatchway, in which is the stair for access; and near this opening the schoolmaster daily surrounds himself with the children of the party, for purposes of instruction. A reference to this circumstance leads to some notice of the principles on which the Canterbury Association is conducted. One object is to put the transmission of emigrants on a decent and every way proper footing. Accordingly, besides every care as respects health and material comforts, regard is had for spiritual and moral advancement. In each ship is a clergyman to conduct religious ordinances, a schoolmaster to superintend the education of the young, and the general discipline is such as to preserve the strictest propriety and order. The rate of passage-money is, we believe, rather higher than is charged by others, but it is stated that, all things considered, this is not grudged. In point of fact, the association contributes towards the expense of the ships and their accommodations, so as to lessen the burden on individual passengers; and it does so from the fund paid for lands. Of the scheme of the association in its wider aspect, it is not our purpose here to enter into particulars, as we have lately treated the subject at length in a work specially designed for emigrants.* We would only observe that, if the price paid for lands in the Canterbury Settlement be considerably greater than what crown lands in the colonies can be elsewhere obtained for, it is on the score of greater advantages being given for the money. Whether settlers will consent to pay in this indirect manner for the establishment of churches, schools, and some other attributes of civilised communities, will of course depend as much on previous habits or feelings as on commercial calculations. One thing is certain, that if capitalists of a respectable standing make this settlement their chosen seat, the place must be eminently advantageous for all those who depend on being employed, and who out of such employment look forward to the realisation of property.

Revenons à nos moutons! We return to the more immediate subject of the article. Having satisfied all reasonable curiosity respecting the interior of the ships, we proceeded to the banquetting hall, where guests and emigrants were respectively taking their seats at several well-plushed tables. At an elevated table in the centre sat the president of the festivity, Lord Lyttleton, supported by the Duke of Newcastle and a number of other distinguished personages, including several ladies of rank. Grace being said (by the dean of Carlisle), the business of eating commenced, and was kept up with vigour under the inspiring strains of the band of musicians. What more need be said? Of course the speeches were creditable specimens of oratory. Yes, one thing it may not be improper to mention in conclusion; and that was the gratification which we felt in hearing farewell said to a large party of persons in a humble rank, by persons occupying the highest social position. This public recognition was done feelingly and becomingly, and not unaccompanied with counsel of practical wisdom; the whole affair, we trow, being somewhat different from the usual method of trundling people out of the country like so many cattle or bales of merchandise. How immensely—thought we, as we wended homeward in a cab—how immensely the aristocracy of this country might widen their basis by taking a personal concern in the movements, wants, and habits of the humbler orders—not in the way of tutelage, for that would be mischievous, but in bringing their education and influence to bear on measures that affect social wellbeing. He was a great man that Lord Baltimore, who led a swarm of his countrymen across the Atlantic.

* The Emigrant's Manual, published in Parts. See the Part on New Zealand.

William Penn was also a great man, not only as a coloniser but as a governor. Among the aristocracy there were surely giants in those days. Perhaps we are about to see a revival of this masculine character.

THE ROMAN WALL.

WHEN the testy Laird of Monkbar had, to the great relief of Mrs Macleuchar, been at length safely deposited in the Hawes Fly, or Queensferry Diligence, and by the lapse of time and the motion of the lumbering vehicle, had become repossessed of his equanimity, the prized folio, which had such a dulcifying tendency as to banish the last traces of impatience and wrath, was Sandy Gordon's 'Itinerarium Septentrionale.' This learned folio was so highly appreciated in its own day, that a Latin edition was published on the continent for the benefit of all European scholars; yet it is no exaggeration to say, that nine-tenths of modern readers would deem it too severe a penance for any ordinary backsliding to be condemned to read it through. It is in fact a most excellent type of the old school of antiquarian treatises, and doubtless was selected as such, when Sir Walter Scott resolved to have a laugh at one of his own favourite hobbies.

Sir Walter Scott did good service in many ways when he produced his inimitable satire. Yet few more memorable instances could be produced of the inconsistency of the human mind than the occupation of Scott at the very time when he was penning his amusing picture of the antiquarian hoarder of 'auld nick-nackets': he was himself expending one of the largest incomes ever derived from literature in an attempt to realise a practical romance—a modern antiquity—not a whit less extravagant than his own credulous hero's *agger* and *vallum* on the Kaim of Kinprunes, or its never-to-be-forgotten sacrificial patera, or 'lang ladle.'

It is not, perhaps, the least valuable of the results which have been indirectly traced to the writings of the great Scottish novelist, that men begin to look upon the study of antiquities, not as a research into obsolete and lifeless curiosities, but as the readiest means of restoring to us the living past, and repeopleing it with the old actors, not as stuffed or painted automata, but as actual men and women like ourselves, each 'in his habit as he lived.' And it is wonderful how much can be done, and how much remains to be done, in the way of thus revivifying the past. In our own British island there exist even now the remains of the well-defined barrier, of which the old Roman practically said: 'Here shall be the bounds of civilisation with its attendant arts, and beyond it all shall be as though it were not!' It is not, therefore, without good reason that men of learning and patient research have deemed their time well spent in exploring this remarkable work, which stretches from the banks of the Tyne, in the neighbourhood of Newcastle—where its termination still oddly enough gives the name to our *Wall's-end coal*!—to the border of the Solway Firth, on the northern skirts of modern England. There has appeared within the last few months a new and comparatively popular account of this singular structure,* to which we would draw the attention of our readers, being convinced that it will amply repay a perusal. 'A dead wall,' says the historian, 'may seem to most a very unpromising subject. The stones are indeed inanimate; but he who has a head to think and a heart to feel, will find them suggestive of bright ideas and melting sympathies. A large part of the knowledge which we possess of the early history of our country has been dug out of the ground. The spade and plough of the rustic have often exposed documents which have

revealed the movements, as well as the modes of thought and feeling, of those who have slept in the dust for centuries. The casual wanderer by the relics of the wall will probably get those vivid glances into Roman character, and acquire that personal interest in Roman story, which will give to the prosaic records of chroniclers a reality and a charm which they did not before possess.'

Such is the spirit in which we are invited to retrace the half-obliterated vestiges of the old barrier, and to seek to reanimate the Roman warder and his barbarian foe. We accordingly find, under such guidance, that much of historical and personal interest is recoverable, and we obtain glimpses of curious import into that old state of things which existed some fifteen or sixteen hundred years ago on the debatable lands afterwards so famous in Border legend and song. 'I confess,' says Horsley, 'that when I view some part of the country in the north of England, where the Romans had their military ways and stations, that question naturally arises which has been so often proposed—What could move them to march so far to conquer such a country? It appears wild and desolate enough at present, but must have been more so at that time, from the accounts the Roman historians have given us of it. I shall leave the Caledonian Galgacus, or Tacitus for him, to return the answer—If the enemy was rich, their covetousness moved them; if poor, their ambition. And when they added further desolation to a desolate country, this was their peace.'

Those, however, who have devoted most time and care to the study of the records treasured up in such archaeological chronicles, are nearly unanimous in the conclusions they arrive at, that Britain was neither a very poor nor a very barbarous country at the period of its invasion by the Romans. 'There are few evils,' says Mr Bruce, 'in the fibres of whose roots the love of money will not be found. Gold was another secret but powerful cause of the hardships which the Romans themselves underwent, and of the countless ills which they mercilessly inflicted upon the miserable islanders. The British chiefs in general appear to have had considerable riches among them. Cesar acquired a large booty in his two descents upon our shore. Prasutagus, the king of the Iceni, died possessed of very great wealth. To a few states in the south, and within a few years after their first subjection, the philosophical Seneca lent more than L.480,000 of our money upon good security, and at exorbitant interest; and Severus got a prodigious mass of riches in this land.' So, too, the abundance of gold relics; torcs, or collars for the neck, armillæ, and bracelets for the arms and wrists, and even breastplates and body-armour, all made of pure gold, and now from time to time brought to light, all attest the abundance of the precious metals in this country in early times, and add to the probability, which is confirmed by other evidence, that prior to the Roman era our islands abounded in native gold.

The contrast between the Roman and native relics is not the least remarkable and interesting feature in these investigations. The native relics consist of the weapons and implements of stone, bronze, or iron, and the personal ornaments of gold—interesting only as evidences of the progress in arts or military skill of those to whom they belonged. Their conquerors, on the contrary, have left us definite literary records, altogether independent of the classic histories which were written for the purpose of preserving a memory of these times. Along the whole line of the wall have been found inscribed tablets, columns, altars, and innumerable coins. Some of the sepulchral tablets especially interest us. One is dedicated to Anicius Ingenius, physician in ordinary to the first Tungrian cohort—a curious and unique piece of evidence, so far as Britain is concerned, of the attachment of a medical staff to the Roman army. Another is dedicated, by a bereaved

* The Roman Wall: A Historical, Topographical, and Descriptive Account of the Barrier of the Lower Isthmus, extending from the Solway to the Tyne. By the Rev. J. C. Bruce, M.A.

husband, 'To his matchless wife, with whom he had lived twenty-seven years without a single quarrel!'—a couple whose incomparable fidelity may justly challenge comparison with the foremost of modern candidates for the Dunmow fitch of bacon.

Among the legends and traditions of 'The Wall,' not a few curious, though distorted memories of the old Roman supremacy, as well as of the lawless freedom which succeeded to them, may still be traced, though these are now rapidly fading before the march of the iron highway and the electric wires. Mr Bruce observes: "There are no old people upon the wall now," as a man of threescore lately said to me when I was endeavouring to persuade him to gather up from his still more ancient neighbours the fireside lore of bygone times.* It is not a little singular, however, to find, as one of the most widespread traditions of this frontier line, the existence of an ingenious Roman substitute for the electric telegraph. 'In this wall,' says an old writer—Sir Christopher Ridley—'was there a trunk of brass, or whatever kind of metal, which went from one place to another along the wall, and came into the empyrean chamber, whereat they had watchers for the same, and yf they had bene stryfe or business betwixt the enemies, and that the watchmen did blow a horn in at the end of the trunk, that came into the chamber, and so from one to one.' Nearly the same tradition exists at the present day along some portions of the line of the more northerly or Scottish Roman Wall, which extended between the Clyde and the Forth; and the clay-pipes and flue-tiles used for the stoves and baths of the old Roman villas are triumphantly produced in proof of its truth.

The traces of Roman and native civilisation along the line of the wall are of the most varied kind; but not less interesting to us is the evidence afforded of the changing influences on which the existence of the most important cities and stations depended. The Romans made it one of their earliest and most indispensable tasks in every new province, to construct great military roads, at the junctions of which, or on the most convenient stations along their course, were speedily established camps or military posts, which again, in many cases, became the nucleus of large towns, and gave rise to many of the chief modern cities; and it is a remarkable evidence of the sagacious policy of imperial Rome, that one of the very first steps taken by the English government after the northern rebellion of 1745, was the reconstruction of the old military way between Newcastle and Carlisle, almost precisely on the line of Hadrian's Roman road.

We have seen, however, in our own day, an entirely new system of roads introduced—namely, the railways; and already the most remarkable changes are resulting from it. Towns, such as St Albans, where formerly hundreds of stage-coaches, postchaises, and gentlemen's carriages used to change horses daily, are now utterly deserted and grass-grown. They are like sea-ports on a broken beach, or like towns along the bank of a river which has abandoned its course. Meanwhile the current flows abundantly in the new channel, and large towns are already springing up at Crewe, Blisworth, and others of the chief points of junction of the great trunk-lines. A precisely similar result seems to have followed the desertion of the old Roman Wall, and the abandonment of the great military roads which its defenders had maintained; and the curious antiquary now exhumed from beneath the wild heath, or the lone sheep-pastures, which seem to the common eye as if the hand of man had never disturbed them, evidences of wealth, luxury, abundant population, and all the appliances of domestic convenience which were familiar to the native of Italy in the second and third century.

*For the most part, the stations—cities which for centuries were the abodes of busy men, and which re-

sounded with the hum of multitudes and the clash of arms—now present a scene of utter desolation. The wayfarer may pass through them without knowing it; the streets are levelled, the temples are overthrown, and the sons and daughters of Italy, Mauritania, and Spain, whose adopted homes they were, no longer encounter him. The sheep, depasturing the grass-grown ruins, look listlessly upon the passer-by; and the curlew, wheeling above his head, screams as at the presence of an intruder. One can scarcely turn up the soil without meeting not only with bronze relics and personal ornaments, fragments of Roman pottery, and other imperishable articles, but also with the bones of oxen, the tusks of boars, deers' horns, and other animal remains; while as for Roman coins, we are almost tempted to fancy their owners must have sown them broadcast, they are met with in such quantities wherever the ground is disturbed.

'It is not a little remarkable,' says Mr Bruce, 'that the names of the stations, which must have been household words in the days of Roman occupation, have for the most part been obliterated from the local vocabulary. They are now only to be recalled, and that with difficulty, by exhuming the stony records of the past, and comparing them with the notices of contemporaneous geographers. The truth is, that military reasons dictated the choice of the stations—commercial facilities gave rise to modern cities. Long may the mere military outpost be consigned to the shepherd's use, whilst the wharf and the warehouse are beset by the busy crowd.'

A very different transition-stage, however, had to be passed through before the military outpost gave place to the warehouse and thronging wharf, such as now crowd the site of the old Pons Aëlli, or Newcastle-upon-Tyne. Instead of the classic names of the *Notitia*, we stumble on such terms as Busy-gap, Bogle-hole, and the more ominous title of Bloody-gap. While yet Scotland and England were rival kingdoms, it was the policy of the governments of both countries to maintain on the Borders a body of men inured to arms, and to encourage a constant system of mutual aggression and wrongs. When the policy of Elizabeth and the accession of James to the throne of England allayed the national strife, the stern warriors of the Border degenerated into sheep-stealers; and instead of dying in the fray, or yielding their necks honourably to the headsman's stroke, they burdened by the score the gallows-tree at Newcastle or Carlisle. It is impossible to imagine the desolation and misery occasioned by such a state of society. Bernard Gilpin, the 'apostle of the north,' was esteemed a brave man, because he annually ventured as far as Rothbury, to preach the gospel of peace to the lawless people of the vale of Coquet. Camden and Sir Robert Cotton, though ardently desirous of examining the wall, durst not venture in their progress eastward beyond Carvoran. 'From thence,' says the illustrious author of the 'Britannia,' writing about 1680, 'the wall goeth forward more aslope by Iverton, Forsten, and Chester-in-the-Wall, near to Busy-gap, a place infamous for thieving and robbing, where stood some castles (Chesters they called them), as I have heard, but I could not with safety take the full survey of it, for the rank robbers thereabouts.' Mr Bruce adds some curious evidence of the ill-repute of this same transmurial region. In the sixteenth century, an act of the merchants

* In glancing along the map of the wall, and contrasting the old Roman names of the stations with the names now attached to them, or the spots which they once occupied, we can trace no resemblance whatever between *Sopidunum* and Wallsend, *Condercum* and Benwell, *Findobala* and Retchester, *Dunum* and Halton Chesters, *Procolitia* and Carrowburgh, &c. But at length, near the western limits of the county of Northumberland, there occurs a station which the Romans called *Magna*. Is not the modern name of this place, Carvoran, simply a translation of the original into the native British language?—Ed.

of Newcastle forbids any guild-brother from taking as an apprentice any one born in Tyndale, Liddisdale, or any such like places, under a penalty of £20; assigning as the reason a notorious fact, that the dishonesty and vice of these regions is hereditary, and propagated in the blood! 'The parties there brought up are known, either by education or nature, not to be of honest conversation; they commit frequent thefts, and other felonies, proceeding from such lewd and wicked progenitors!' Fully a century later, curious evidence exists to shew that the old prejudices against these Bordermen had in nowise diminished—a case of prosecution for defamation being on record so late as the middle of the seventeenth century, because a baker of Newcastle had styled a brother freeman 'a *Bussey-gap rogue*!'

Scott's '*Border Minstrelsy*' supplies abundant and familiar illustration of the strange lawless system that prevailed on the debatable lands lying between the two kingdoms long after Scotland and England had become one. It was quaintly remarked by a reviewer, after referring to some of the forays and cattle-raids of the old Border Scotts, that Sir Walter had been at more pains to trace his descent from thieves than most men would take to prove their ancestors honest men! We cannot spare room here, however, for following further the lively adventures of the *Bussey-gap Rogues*, though they retained their hereditary character down to the reign of George III.

No less curious are the mediæval traditions that linger about the precincts of the old wall in the wilder districts of Northumberland. At Sewingshields, for example, is the locality of the familiar tradition of the renowned King Arthur, who, with his Queen Guinever, his lords and ladies, hawks and hounds, lie to this day enchanted in an unknown cave in the crags, under a spell, only to be broken when some one shall first blow a bugle-horn which lies near the entrance of the cave, and then, with the sword that lies beside it, cut a garter through which binds it to the wall. Some fifty years ago, so says veracious tradition, the farmer of Sewingshields discovered, under the ruins of the old castle, a subterranean passage unknown to him before. He entered, and made his way along a low vaulted arch, his courage sinking at every step as he trod amid toads and slimy lizards, and startled at the flight of dark-winged bats, disturbed by his intrusion. At length a dim light appeared before him, and following its guidance, the bold Northumbrian farmer stood under the fretted roof of a vast subterranean hall, strangely lighted by an unearthly glow. King Arthur, with his queen and court, slumbered on a circle of thrones and couches round the walls, and at their feet were thirty couples of gigantic wolf-hounds. On a stone-table in the middle of the hall lay the spell-dissolving horn, sword, and garter. The farmer seized the sword, and as he drew it from the scabbard, the eyes of the monarch and his courtiers opened. He cut the garter, and they sat up, and the dogs shook themselves from the sleep of centuries. But the courage of the intruder failed him—the sword slowly returned to its scabbard; and as the strange court sunk again back to their spell-bound slumbers, King Arthur exclaimed:

'Oh wo betide the evil day

On which this witless wight was born!

Who drew the sword, the garter cut,

But never blew the bugle-horn!'

The farmer was so terror-stricken that he could never afterwards tell how he escaped, or find again the entrance to the enchanted hall.

Such is our modern version of the curious myth of the good King Arthur, who Merlin swore should come again to rule. In many forms it has survived through changing centuries, and is well worth considering for the truths it embodies under its quaint imagery. Mean-

while, however, it will suffice to shew how many pleasant topics may be suggested to the rambler along the course of the old Roman barrier, which once stretched its unbroken line of forts, curtain walls, and military way, from Segedunum, or Wallsend, near the mouth of the Tyne, to Bowness on the Solway Firth. To those who desire to become familiar with the history and antiquities of this remarkable monument of the military arts of ancient Rome, we recommend Mr Bruce's work, from which we have extracted some of the above passages. To the antiquary its attractions are great, abounding as it does with engravings of altars and inscriptions, maps, sections, and ground-plans of all that most command his study, and many of these being entirely new, and derived from the enthusiastic author's own personal observations. What we have said above, however, will suffice to shew that others besides the professed antiquary will find in the work matter to attract, to instruct, and to amuse; and we should think little of that mind which, amid all the stirring interest of the present, can spare no thought for that older state of being from whence the present has sprung, and to which it owes a reverence in some degree akin to that which is due to the parent from the child.

FRENCH COTTAGE COOKERY.

I HAD frequently remarked a neat little old woman, in a clean, stiff-starched, quilted cap, going to and from a neighbouring chapel, without however its ever coming into my head to ask who she was; until one day a drove of oxen alarmed her so visibly, that I opened the gate of my little garden, and begged her to remain there in safety till the cattle had passed by.

'Madame is very polite; she has no doubt been in France!'

'Yes,' answered I in her native language, 'I resided there many years, and perceive I have the pleasure of addressing a Frenchwoman.'

'I was born in England, madame; but at eight years of age went with my father to Honfleur, where I married, and continued to reside until four years ago, when my poor husband followed the remains of his last remaining child to the grave, and in less than a fortnight after died of the *grippe* himself. I had no means of living then, being too old to go out as a *femme de journée*, my only means of gaining a livelihood; so I returned to the place where I was born, and my mother's youngest brother allows me thirty-five pounds a year, upon condition that I am never more than a month out of England again.'

We soon became great friends, and by degrees I learned her history. This uncle of hers was a year younger than herself—a thorough John Bull, who hated the French, and ridiculed everything that was foreign. His heart, however, was kind and generous, and he no sooner heard of the destitute condition in which his aunt was left, than he hastened across the Channel for her, bought in her clothes and furniture, which she was forced to sell to enable her to satisfy her creditors, and then made her a present of them all again, offering to convey her to her native country, and settle upon her enough to enable her to live there decently; which allowance, however, was to cease if she was ever known to be more than a month out of England. 'Time enough for her to pray over her French friends' graves, poor benighted Catholic that she be! but I won't have more of my money spent among them foreign frog-eaters nor I can help.' The poor woman had no other choice; but it was several years before she reconciled herself to habits so different from those to which she had been so long accustomed; and to the land she preserved the French mode in dressing, eating, and manner. At the topmost storey of a high house she took

two unfurnished rooms: the largest contained her bed, *seuilure*, *commode*, *pendule*, *prie-dieu*, and whatever was best and gayest of her possessions. The room behind was *commode*, as she called it, to pots and pans, basins and buckets, her night-quilt and pillow, and whatever else was not 'convenable' to display to 'le monde'; but the front apartment was where she lived, slept, cooked, ate, and prayed; and a nice, clean, cheerful, well-furnished room it was, and many a pleasant hour have I spent in it with the old lady, conversing upon cookery and politeness—two requisites she found the English quite deficient in, she said. I confess I am somewhat inclined to agree with her, especially as to the former; and those who agree with me in opinion will perhaps be glad to have her recipes for the inexpensive French dishes which fine cooks despise too much to print in cookery-books.

We shall begin with the *pot au feu*, in *Mme Mian's* own words:—'Get from the butcher a nice, smooth, pretty piece of beef, with as little skin, fat, strings, and bones, as possible: one pound does for me, but for a family we shall say three pounds. Put this into—not an iron pot, not a brass pot, not a tin pot—but an earthen pan with a close-fitting lid, and three quarts of filtered water, and some salt. This you must put, not on the fire, but on the top of the oven, which is heated from the fire, and which will do just the same as a hot hearth: let it boil up; skim and deprive it of all grease. When this is accomplished, take three large carrots, cut in three pieces—three, remember!—one large parsnip cut in two, two turnips, as many leeks as possible—you can't have too many; two cloves ground, and the least little idea of pepper, and onions if you like—I only put a burnt one to colour. Now cover up, and let it stay, going tic-tic-tic! for seven hours; not to boil, pray. When I hear my bouillon bubble, the tears are in my eyes, for I know it is a *plat manqué*. When ready, put the beef—what so country people call *bovillie*—which word, they say, is vulgar—never mind!—put it on a dish, and with tasteful elegance dispose around the carrots, parsnip, and turnip. Then on slices of bread at the bottom of a bowl pour your soup, and thank God for your good dinner.'

I sometimes tie the white part of my leeks in bundles, like asparagus, and serve on roasted (she never would say toasted) bread. Next day I warm the soup again, introducing rue, vermicelli, or fresh carrots cut in shins, as my fancy may lead me, and eat the beef cold with tarragon vinegar. *Mme Fouache*, my sister-in-law, puts in celery, parsley, and a hundred other things; but that is modern—mine is the old, respectable *pot au feu*; and I never have nonplus, what all the *Fouaches* are so fond of, which is properly a Spanish, not a French dish, called *olla podrida*—very extravagant. Not only have they beef, but a fowl, a ham, or piece of one; a Bologna or Spanish sausage; all the vegetables named above; *pois chiches* (large hard peas), which must be soaked a night; a cabbage, a hard pear, and whatever they can gather, in the usual proportion of a small quart to a large pound of meat; and not liking oil, as the Spaniards do, *Mme Fouache* adds butter and flour to some of the soup, to make sauce. The fowl is browned before the fire, and served with pear, peas, celery, and the ham with the cabbage; the beef with the carrots, leeks, and parsnips; the sausage by itself; and the soup in a tureen over a *croûton*. This takes nine hours of slow cooking; but mine, the veritable *pot au feu* Français, is much better, as well as simpler and cheaper.'

'Thank you, *Mme Mian*,' said I; 'here it is all written down. Is that batter-pudding you have arranged for frying?'

'No, madame; it is *sarrasin*. It was my dinner yesterday, on *boudin*; to-day I fry it, and with a garnet besides, am well dined.'

'How do you cook it?'

'In France I take half a pint of water and a pint and a half of milk; but here the milkman saves me the

trouble: so I take two pints of his milk, and by degrees mix in a good half pint of buckwheat-flour, salt, an egg if you have it, but if not, half an hour's additional boiling will do as well. This mess must boil long, till it is quite, quite thick: you eat some warm with milk, and put the remainder into a deep plate, where, when cold, it has the appearance you see, and is very nice fried.'

'And the garnet?'

'I boil it, skin it, and bone it, and pour over it the following sauce:—A dessert-spoonful of flour rubbed smooth into a half tumbler of water; this you boil till it is thick, and looks clear; then take it off the fire, and pray don't put it on again, to spoil the taste, and pop in a good lump of Dutch butter, if you can't afford fresh, which is much better, and a small teaspoonful of vinegar; pour this over your fish: an egg is a great improvement. I can't afford that, but I sometimes add a little drop of milk if I have it.'

'I am sure it must be very good: and, by the by, can you tell me what to do with a miserable half-starved chicken that the dogs killed, to make it eatable?'

'Truss it neatly, stuff it with sausage and bread-crumbs; mix some flour and butter, taking care it does not colour in the pan, for it must be a white roux; plump your chicken in this, and add a little water, or soup if you have it; take four little onions, two small carrots cut in half; tie in a bundle the tops of celery, some chives, a bay-leaf, and some parsley; salt to taste, with a bit of mace—will be all you require more; cover close, so that all air is excluded, and keep it simmering two hours and a quarter: it will turn out white and plump; place the vegetables round it; stir in an egg to thicken the sauce, off the fire, and your dish will not make you blush.' I did as she directed, and found it very good.

I went very often to *Mme Mian's*, and invariably found her reading her prayer-book, and she as invariably put it down unaffectedly without remark, and entered at once into conversation upon the subject I introduced, never alluding to her occupation.

'I fear,' said I one day, 'I interrupt your devotions.'

'*Du tout*, madame, they are finished; I am so far from chapel I can only get there upon Sundays or on the very great saints' days; but I have my good corner here, pointing to the *prie-dieu*, which stood before what I had always imagined shelves, protected from the dust by a green baize curtain; and you see I have my little remembrances behind this,' added she, pulling the curtain aside, and displaying a crucifix, 'the Virgin mild and sweet St John' standing by, her string of beads, the crowns of everlasting from her parents', husband's, and children's graves, several prints of sacred subjects, and a shell containing holy water.

Her simple piety was so sincere that I felt no desire to cavil at the little harmless superstitions mixed with it, but said: 'You must have many sad and solitary hours; but you know where to look for consolation I find.'

'Yes, indeed, madame. Without religion how could I have lived through my many sorrows? but God sustains me, and I am not unhappy, although wearing out my age in poverty and in a strange land, without one of those I loved left to comfort me; for if the longest life be short, the few years I have before me are shorter still, and I thank Him daily for the comfort I derive from my Christian education.'

She was too delicate-minded to say Catholic, which I knew she meant, and I changed the subject, lest our ideas might not agree so well if we pursued it much further. 'Pray, *Mme Mian*, what is the use of that odd-looking iron stand?'

'It is for stewing or boiling: the baker sells me the burnt wood out of his oven (we call it *braise* in France), which I mix with a little charcoal; this makes a capital fire, and in summer I dress my dinner. You see there are three pots, one above the other; this saves me the heat, and dirt, and expense of a fire in the grate, for it stands in the passage quite well, and stewed beefsteak is never so good as when dressed by it.'

'How do you manage?'

'I make a rout, and put to it a quantity of onions minced small, and a bit of garlic, when they are quite soft; I add salt, a little pepper, and some flour and water, if I have no gravy or soup. Into this I put slices of beef, and let it stew slowly till quite done, and then thicken the sauce with polder starch. The neighbours down stairs like this so much, that we often go halves in both the food and firing, which greatly reduces the cost to both; and it keeps so well, and heats up so nicely! They eat it with boiled rice, which I never before saw done, and like very much; but I boil my rice more than they do, and beat it into a paste, with salt and an egg, and either brown it before the fire or fry it, which I think an improvement; but neighbour Green likes it all natural.'

'Oh, do tell me about *soupe à la graisse*; it sounds very uninviting.'

'I seldom take it in this country, where vegetables are so dear, and you must prepare your *graisse* yourself.'

'How do you prepare it?'

'By boiling dripping with onions, garlic, and spices; a good tablespoonful of this gives a nice taste to water, and you add every kind of vegetable you can obtain, and eat it with brown bread steeped in it. The very poor abroad almost live on it, and those who are better off take a sou from those who have no fire, *pour tremper leur soupe*; and surely on a cold day this hot mess is more acceptable to the stomach than cold bread and cheese.'

'You seem very fond of onions with everything.'

'Yes; they make everything taste well: now *crevettes*, what you call shrimps, how good they are with onions!'

'How! onions with shrimps!—what an odd combination! Tell me how to dress this curious dish.'

'When the shrimps are boiled, shell them, take a pint or a quart, according to your family; make a rout, adding pepper; jump (*sauter*) them in it, adding, as they warm, minced parsley; when quite hot, take them off the fire, and stir round among them a good spoonful of sour cream. *Pois de prud'homme* and *pois mange-tout* are dressed the same, leaving out the flour and pepper.'

'I don't know what *pois* you mean.'

'The *prud'homme*, when they first come in, are like lupin-pods, and contain little square white beans. You do not shell them till they are quite old, and then they are good also, but not nearly so good or so wholesome as in the green pods. The *pois tîr* or *mange-touts* are just like every other pea—only as you can eat the pods, you have them full three weeks before the others are ready, and a few handfuls make a good dish: you must take the string off both, as you do with kidney-beans, unless when young.'

'I suppose you eat the white dry beans which are to be bought at the French shop here.'

'No, never: they don't agree with me, nor indeed are they very digestible for any but strong workers.'

'How should they be dressed?'

'Steeped from five to twelve hours; boiled till tender; then jumped with butter and parsley in a pan after draining well; and milk and an egg stirred in them off the fire, or what is much better, a little sour cream or thick buttermilk. They eat well with roast mutton, and are much more delicate than the red beans, which, however, I have never seen sold in this country.'

'Do you drink tea?'

'I would do so were I confined to the wishy-washy stuff people of my rank in England call coffee—bad in itself, and worse prepared.'

'How do you manage?'

'I buy coffee-beans ready roasted or not: a coffee-mill cost me 1s. 6d., and I grind it every now and then myself; but I always freshen my beans by jumping them in a clean frying-pan, with a little new butter, till quite dry and crisp—very easy to do, and the way to have good coffee. I do a little at a time, and use that small coffee biggen, which is now common even in this country: two well-heaped teaspoonfuls serve me; but were I richer, I should put three. Upon these two spoonfuls I pour a cup of boiling water, and while it is draining through,

heat the same quantity of milk, which I mix with the clear coffee, and I have my two cups. Chicory I don't like, spite of the doctor, who says it is wholesome. All French doctors preach against coffee; but I who have drunk it all my life am of opinion they talk nonsense. You may take it stronger or weaker; but I advise you always to make it this way, and never try the foolish English practices of boiling, simmering, clearing, and such like absurdities and fussings. I generally, however, break-fast upon *soupe à la citronille*, which is very nice.'

'Tell me how to make it.'

'You cut your citronille (pumpkin, I believe you call it) in slices, which you boil in water till soft enough to press through a cullender into hot milk; add salt and pepper, stir smooth, and give one boil, and it is ready to pour upon your bread as a *purée*. A little white wine improves it, or you may make it *au gras*, mixing a little white meat gravy; but to my mind the simple soup is the best, although I like a bit of butter in it I confess. Turnips and even carrots eat very well prepared this way many think; but I prefer the latter prepared à la *Crêpe*, which you do very well in England.'

'You use a great deal of butter, which at one time of the year is very dear in England.'

'And in France also; therefore I buy it at the cheap seasons, put it on the fire, and give it a boil, skimming it well; then I let it settle, and pour off all that is clear into bottles and pots, and it keeps until the dear time is past, quite well for cooking.'

'And eggs?'

'Nothing so simple, when quite new laid: butter them well with fresh butter; remember if a pin's point is passed over, the egg spoils—rub it well into them, and place in jars, shaking over them bran or dry sand; wash when about to use them, and you would say they had been laid two days back only.'

'Do you eat your prepared butter upon bread?'

'I never do anything so extravagant as to eat butter upon bread: I prefer to use it in my cookery; but I don't think boiled butter would taste well so, though it fries beautifully on *maigre* days; and on others I use lard to my potato.'

'Does one satisfy you?' asked I laughing.

'Oh yes, if it is of a tolerable size. I cut it in pieces the size of a hazel-nut, dry, and put them into a common sauce-pan, with the least bit of butter, shaking them about every few minutes; less than half an hour does them; they are eaten hot, with some salt sifted over.'

'I suppose you often have an omelet?'

'Not often; but let me offer you one now.'

I had scarcely assented, when the frying-pan was on the fire to heat three eggs broken, some chives and parsley minced, and mixed with a little pepper and salt all together—Mme Miau throwing in a drop of milk because she happened to have it, in order to increase the size of the omelet, although in general she seldom used it—and flour *never*. It was thrown upon the boiling fat, and as it hardened, lifted up with two wooden forks round and round, and then rolled over, *never* turned—the upper part, which was still slightly liquid, serving for sauce as it were. This was all, and very good I found it. Another time she put in grated cheese, which was also excellent.

'I can't comprehend how you contrive to make everything so good at so little expense,' said I.

'There is no merit in making good things if you are extravagant: any one can do that.'

'No, indeed, not every one.'

'Cookery, in a little way,' continued Mme Miau, 'appears to me so simple. To fry well, the fat must *land* before putting what you wish fried into it; and this you ascertain by throwing in a piece of bread, which should gild immediately: the colour should be yellow or light-brown—never darker. To *stew*, the only rule is to let your meat simmer gently for a long time, and keep in the steam, and all sorts should be previously sautéed in a rout, which keeps in the juice: the look, also, is important, and a burnt onion helps the colour.'

Mme Miau, however, could cook more elaborate dishes than those she treated herself to, and I shall subjoin

some of her recipes, all of which I have tried myself; and if the preceding very economical but thoroughly French dishes please as a foundation, I may give in a future number plates of rather a higher description.

THE FIRST PRINT.

THE art of the goldsmith, in our days limited to the fashioning of gold and silver into sacred vessels, table-ornaments, or utensils for daily use, was formerly not deemed unworthy of being exercised by the most celebrated hands. At the period of the revival of the arts in Italy, the goldsmiths were real, and often great artists in design, sculpture, carving, and engraving. With them originated the art of engraving on metals, and about the middle of the fifteenth century they introduced an ornamental kind on plates of silver or gold. When the design was engraved, the lines or incisions were filled in with a shining black compound made of silver and lead, so as to produce the effect of shadow; and as the plates thus cut and prepared were called *niello*—the Italian contraction of the Latin word *nigellum*—the goldsmiths were also known by the name *niellatori*. Amongst the most remarkable of these workers in *niello* is the Florentine, Jomasso Finiguerra, who lived in the middle of the fifteenth century. He, in common with all the goldsmiths of the age, devoted all the resources of his genius and skill to the engraving, and afterwards inlaying with *niello*, a kind of small semicircular plates of silver, three or four inches in depth, to which the name *pax* was given, from the words 'Pax te cum' ('Peace be with thee') uttered by the officiating priest when, after kissing them himself, he presented them to be kissed by the other priests in attendance. Distinguished above all other productions of this kind, as well by its artistic merit as by its subject, is one *pax*, representing the Assumption of the Virgin; and though it bears neither name nor mark, yet there can be no doubt that it is the workmanship of Finiguerra, as in the city archives of Florence is to be found an entry of 'sixty-six florins paid to Jomasso Finiguerra for a *pax*, on which is engraved the Assumption of the Virgin.' This *pax* is still carefully preserved in the museum of Florence; and when we consider that the art was then in its infancy, it is saying not a little for the production, that eyes that have been feasting on the works of the great masters can dwell with complacency on it, as far surpassing anything of which that age could boast. But whatever may be its intrinsic merit, a discovery lately made is calculated to add to its celebrity amongst amateurs.

Vasari, in his 'Lives of Celebrated Painters,' relates that a woman having accidentally gone into Finiguerra's studio, and laid down upon a silver plate engraved in *niello* a wet cloth, was very much surprised, when she took it up again, to find the whole of the engraving stamped upon it. This incident, calculated to strike even an ordinary mind, must have made a deep impression on the vivid imagination of Finiguerra. It is but natural to suppose that it must have immediately occurred to the ingenious artist, that the impression of the engraving might as easily be taken on paper as on cloth, nor is it less likely that having tried several experiments with the same result as before, he persevered till he at last devised a mode of pressing by a cylinder a damp sheet of paper on the engraving, and thus discovered the art of taking a print from a metal plate.

All this, however, probable and natural as it is, would be but mere conjecture, and was only such till

the end of the last century, when the learned Abate Zani discovered among the treasures of art in the Louvre, a proof-print of this *niello* of Finiguerra, printed with dark and indelible ink; and now the precious sheet, carefully separated from the other prints of the old Italian masters, and with a glass over it, is exhibited to the admiring gaze of amateurs, as the first print ever taken from an engraving.

THE FLOATING GARDENS OF MEXICO.

THE greater part of the vegetables consumed in Mexico are cultivated in the Chinampas, called by Europeans floating gardens. They are of two kinds: some are movable, and frequently driven up and down by the wind; others firm, and fixed to the shore. The former only can be termed floating, but the number of these is daily lessening.

The ingenious invention of the chinampas is traceable to the end of the fourteenth century, and the idea was probably suggested to the Aztecs by nature itself. On the marshy banks of the lakes of Xochimilco and Chalco, the waters, in their periodical swellings, throw up clods and mounds of earth, covered with grass and tangled roots. These masses, after floating for a long time up and down, the sport of every breeze, sometimes form into groups of small islets. A tribe, too weak and insignificant to establish any settlement on the mainland, took advantage of this portion of the soil thus accidentally placed at their disposal, and the possession of which was not likely to be disputed. The most ancient chinampas were only turf-mounds artificially joined, and then tilled and planted by the Aztecs. These floating islands are found in every zone. Humboldt describes those he saw at Quito, in the River Guayaquil, as being about twenty feet long, floating about in the middle of the stream, and full of the bamboo, the *Pistia stateotes*, and other plants, whose roots are knotty, and disposed to intertwine. They are also to be found in the small lake called Lago di Agua Solfa of Tivoli, near the Baths of Agrippa, composed of sulphur, of carbonate of lime, and of the leaves of the *Ulea thermalis*, and shifting from place to place at every breath of wind.

The industry of the Aztec nation has brought to great perfection the idea suggested by the masses of earth broken off from the banks of the rivers. The floating gardens found by the Spaniards in great numbers, and many of which are still to be found in the Lake of Chalco, were a sort of rafts formed of reeds, rushes, and rough, prickly, tangling shrubs, and covered by the Indians with a layer of rich earth, impregnated with muriate of soda. This salt is gradually extracted from the soil by watering it with the water of the lake, and the ground is more or less fertilised, according to the more or less frequent application of this lye—for such, even when salt, the water becomes by filtration through the soil. The chinampas sometimes contain a hut for the Indian in charge of a group of these floating gardens, which can be towed or impelled by long poles at pleasure, from one side of the river to the other; but most of those now known by the name are fixed; and as this happens just in proportion to the distance of the fresh-water lake from the salt-water lake, many are to be found along the Vega, in the marshy soil between the Lake of Chalco and the Lake of Tezcuco. Each chinampa forms a parallelogram, three hundred feet long and about twenty in breadth, and is separated from its neighbour by a narrow dike. In these chinampas are cultivated beans, peas, capsicums, potatoes, artichokes, and a great variety of other vegetables, and the borders are generally edged with flowers, and sometimes by a little hedge of rose-trees. Indeed the

beauty of the scenery altogether makes a boating excursion round them, especially those of Istacalco and Lake Chapala, most delightful.

GENTLEMEN.

Heralds used formerly to go round and enregister the arms of different families, but since 1686 the custom has been abandoned. The kings-at-arms every thirty years also used to register the births, deaths, and marriages that had occurred since their last visitation; and those who had usurped titles or dignities which did not belong to them, were obliged, under their own hands, to disclaim all pretence to them, and were publicly degraded in the nearest market-town. Sir T. Smith, who died in 1577, says—'Gentlemen be those whom their blood or race do make noble or known: the commonwealth of England is divided into three sorts of persons—the sovereign; the gentlemen, which are divided into two parts; the barony, or estate of lords, and those who be no lords, such as knights, esquires, and simple gentlemen; the third and last are called yeomen.' Nobility means notability: worthy of being noted or known. Nobility can be acquired; gentility must be innate—must take a long time to grow. James I. told his nurse he might make her son a duke, but could not make him a gentleman; although in manners and appearance the youth probably (as he had had a good education) more nearly resembled what we term a gentleman in these degenerate days than the worthy king himself. Among the gentry, not among the peers, with the exception of three or four families, must we look for the true nobility of England. There are upwards of 130,000 ancient nobility, and not much above 500 peers. The old landed proprietors are the ancient nobility. The old writers speak of the nobility named and unnamed—that is, titled and untitled. Those families whose names are the same as their estates are the noblest. Commoner means those who are amenable to common tribunals: peers are not commoners, being their own judges. This, however, is an exclusive privilege, but no proof of nobility; for many persons who have precedence over peers are subject to the common law: sons of dukes, marquises, even princes of the blood, before they are made peers, are amenable to common tribunals.

NATURAL WATER-PURIFIERS.

Mr Warrington has for a year past kept twelve gallons of water in a state of admirably-balanced purity by the action of two gold fish, six water-snails, and two or three specimens of that elegant aquatic plant known as *Valisneria spiralis*. Before the water-snails were introduced, the decayed leaves of the *valisneria* caused a growth of slimy mucus, which made the water turbid, and threatened to destroy both plants and fish. But under the improved arrangement, the slime, as fast as it is engendered, is consumed by the water-snails, which reproduce it in the shape of young snails, whose tender bodies again furnish a succulent food to the fish; while the *valisneria* plants absorb the carbonic acid exhaled by the respiration of their companions, fixing the carbon in their growing stems and luxuriant blossoms, and refreshing the oxygen (during sunshine, in visible little streams) for the respiration of the snails and the fish. The spectacle of perfect equilibrium thus simply maintained between animal, vegetable, and inorganic activity, is striking and beautiful; and such means may possibly hereafter be made available on a large scale for keeping tanked water clean and sweet.—*Quarterly Review*.

THE POORER CLASSES IN ENGLAND UNTAXED.

In no country in Europe is the peasant and artisan so free from all enforced taxation as in England. The French peasant pays a salt-tax, a contribution *personnelle et mobilière*; a licence-tax; and, if he live in a town, the vexatious and burdensome *octroi*. The German labouring man pays a poll-tax, a class-tax, a trade-tax, and sometimes a neat-tax; and in certain parts an *octroi* also. The English working-man pays no direct taxes whatever. He is taxed only for his luxuries [soap the

only exception]; he pays only on the pleasures of the palate: if he chooses to dispense with luxuries, none of which are essential, and few of which are harmless, he dispenses with taxation too; if, on the contrary, he chooses to smoke his pipe and drink his glass, to sip tea from China, and sweeten it with sugar from Jamaica, he at once puts himself into the category of the rich, who can afford these superfluities; he voluntarily steps into the tax-paying class, and forfeits all title to sue or to complain in *forma pauperis*. We are far from wishing to intimate that he should not indulge in all harmless luxuries to the utmost limit that he can afford; but most indisputably, in thus leaving it optional with him whether he will contribute to the revenue or not—and subjecting him to no actual privations if he decline to do so—parliament is favouring him to an extent which it vouchsafes to no other class in the community, and to which no other land affords a parallel. His earnings are decimated by no income-tax, like those of the clerk; his cottage is subject to no window-tax, like that of the struggling professional aspirant; very generally he does not even contribute to the poor-rate; he pays, like the rich man, to the state only when he chooses to imitate the rich man in his living.—*Edinburgh Review*.

A BRIDAL.

BY THE AUTHOR OF 'NADONNA FIA, AND OTHER POEMS.'

A BRIDAL is a joyous thing—

A dancing pageant light and gay;

With loves and graces on the wing,

And all the heart's wild hopes at play!

The banquet glows, the goblet flows,

In every eye is happier light;

And e'en the loveliest maiden shews

More lovely in her bridal-white,

Alternate touch'd with either rose,

The crimson and the pale delight!

A bridal is a heartsome thing,

Where'er the clasping hands of youth—

Image the clasping hearts that cling

Each unto each with tender truth!

The sunlight of the heart appears

On man and matron, maid and boy;

The father's mingling hopes and fears

Are spirits in the heart's employ;

The mother's and the sister's tears

Gush from the heart's deep wells of joy!

A bridal is a sacred thing,

Far seen and heard beyond the sky;

And angels stoop on brooding wing,

And Duty bends her awful eye:

The spirit of the future there,

With prescient glance of solemn claim,

And flashing hints of 'bear! forbear!'

Bids the wild breast its transports tangle;

Hints of commingling dark and fair,

And cloud and sun, and praise and blame!

Oh, bride! young, beautiful, and pure!

Still braid the tress and plume the brow!

And Passion's every cherish'd lure

More fondly, sweetly, cherish now!

Oh, bridegroom! wheresoe'er hath rang'd

Thy heart before, in freedom bold,

Think, ere again 'tis chill'd or chang'd,

How many a lip this truth hath told,

The Nemesis of hearts estranged

Avenge Love a thousandfold!

TALES OF THE COAST-GUARD.

CALF-LOVE.

It may be as well to observe at starting, that the slight, unpretending sketches I am about to jot down of a few rough adventures in the Preventive Service of this country, will present no fancy pictures of high-souled, dashing smugglers, such as I have seen spouting heroics at minor theatres—rollicking gentlemen, who abound in all the first-rate virtues of generosity, daring, gallantry, and skill, slightly clouded, if at all, by an irresistible propensity for defrauding the revenue—more, it is usually made to appear, for the fun and dash of the thing, or to rig out amiable sweethearts or devoted wives with expensive nick-nacks, than for any liking for the, in the main, idle and skulking life of the professional smuggler. I never ran athwart any such gentry; but then it is right to state that my experience was confined to about a hundred miles or thereabouts of the southern coasts of England, and those heroes, I fancy, are only to be found, if at all, in latitudes frequented by their relatives—the horse-marines. The fellows I now and then overhauled were of quite another stamp, and seldom sailors either, at least not of the true salt-water lick. Handy enough in a boat, no doubt, but with much better land than sea-legs, as many an unsuccessful shore-chase has but too frequently proved to my entire conviction. I am speaking of between thirty and forty years ago, at which time your genuine sea-dog but little relished such a hide-and-seek along-shore life, especially if anything better could be had; and it can, I should think, be hardly otherwise in these days of steam revenue-cruisers, admirably organised coast-guard, reduced duties, and, consequently, consumptive profits. Thus much hinted by way of warning to readers of a romantic taste, I proceed with the narrative of my first adventure in the revenue-service, prefacing it with a brief chapter of my earlier history, without which it would be nearly if not altogether unintelligible.

My name is Warneford—at least it is not very unlike that—and I was born at Itchen, a village distant in those days about a mile and a half, by land and ferry, from Southampton. How much nearer the, as I hear and read, rapidly-increasing town has since approached I cannot say, as it will be twenty-nine years next July since I finally quitted the neighbourhood. The village, at that time chiefly inhabited by ferry and fishermen, crept in a straggling sort of way up a declivity from the margin of the Itchen river, which there reaches and joins the Southampton estuary, till it arrives at Pear-Tree Green, an eminence commanding one of the finest and most varied land-and-water views the

eye of man has, I think, ever rested upon. My father, a retired lieutenant of the royal navy, was not a native of the place, as his name alone would sufficiently indicate to a person acquainted with the then Itchen people—almost every one of whom was either a Dible or a Diaper—but he had been many years settled there, and Pear-Tree Churchyard contained the dust of his wife and five children—I and my sister Jane, who was a year older than myself, being all of his numerous family who survived their childhood. We were in fair circumstances, as my father, in addition to his half-pay, possessed an income of something above a hundred pounds a year. Jane and I were carefully, though of course not highly or expensively educated; and as soon as I had attained the warrior-age of fifteen, I was despatched to sea to fight my country's battles—Sir Joseph Yorke having, at my father's request, kindly obtained a midshipman's warrant for me; and not many weeks, after joining the ship to which I was appointed, I found myself, to my great astonishment, doubling the French line at the Nile—an exploit which I have since read of with far more satisfaction than I remember to have experienced during its performance.

Four years passed before I had an opportunity of revisiting home; and it was with a beating as well as joyful heart, and light, elastic step, that I set off to walk the distance from Gosport to Itchen. I need hardly say that I was welcomed by Jane with tears of love and happiness. It was not long, however, before certain circumstances occurred which induced my worthy but peremptory father to cut my leave of absence suddenly and unmercifully short. I have before noticed that the aborigines of my native place were for the most part Dibles or Diapers. Well, it happened that among the former was one Ellen Dible, the daughter of a fisherman somewhat more prosperous than many of his fellows. This young lady was a slim, active, blue-eyed, bright-haired gipsy, about two years younger than myself, but somewhat tall and womanly for her age, of a light, charming figure, and rather genteel manners; which latter quality, by the by, must have come by nature, for but little education of any kind had fallen to her share. She was, it may be supposed, the *belle* of the place, and very numerous were her rustic admirers; but they all vanished in a twinkling, awestruck by my uniform, and especially by the dangling dirk, which I occasionally handled in a very alarming manner; and I, sentimental moon-calf that I was, felt, as it is termed, deeply and earnestly in love with the village beauty! It must have been her personal graces alone—her conversation it could not be—which thus entranced me; for she seldom

spoke, and then in reply only, and in monosyllables; but she listened divinely, and as we strolled in the evening through the fields and woods between Itchen and Netley Abbey, gazed with such enchanting eloquence in my face as I poured forth the popular love and nonsense poetry of the time, that it is very possible I might have been sooner or later entrapped into a ruinous marriage—not by her, poor girl! she was, I am sure, as guileless as infancy, but by her parents, who were scheming, artful people—had not my father discovered what was going on, and in his rough way dispelled my silly day-dreams at once and for ever.

The churchyard at the summit of Pear-Tree Green, it used to be commonly said, was that in which Gray composed his famous 'Elegy,' or at all events which partially inspired it. I know not if this be correct; but I remember thinking, as I sat one fine September evening by the side of Ellen Dible upon the flat wooden railing which then enclosed it, that the tradition had great likelihood. The broad and tranquil waters of the Southampton and Itchen rivers—bounded in the far distance by the New Forest, with its wavy masses of varying light and shade, and on the left by the leafy woods, from out of which I often think the gray ruins of the old abbey must in these days look grimly and spectre-like forth upon the teeming, restless life which mocks its hoary solitude—were at the full of a spring-tide. It was just, too, the hour of 'parting day'; and as the sun-tipped spires of the Southampton churches faded gradually into indistinctness, and the earlier stars looked out, the curfew, mellowed by distance into music, came to us upon the light air which gently stirred fair Ellen's glossy ringlets, as she, with her bonnet in her hand—for our walk had tired her—looked with her dove-innocent, transparent eyes in mine, while I repeated Gray's melodious lines. The *Elegy* was concluded, and I was rapturising even more vehemently than was my wont, when, whack! I received a blow on my shoulder, which sent us both off the rail; for Ellen held me by the arm, and it was quite as much as I could do to keep my feet when I reached them. I turned fiercely round, only to encounter the angry and sardonic countenance of my father. 'I'll have no more of this nonsense, Bob,' he gruffly exclaimed. 'Be off home with you, and to-morrow I'll see you safe on board your ship, depend upon it. As for this pretty minx,' he continued, addressing Ellen, who so trembled with confusion and dismay that she could scarcely tie her bonnet-strings, 'I should think she would be better employed in mending her father's shirts, or darning her brother's stockings, than in gossiping her time away with a brainless young lubber like you.' I was of course awfully incensed, but present resistance, I knew, was useless; and after contriving to exchange a mute gesture with Ellen of eternal love, constancy, and despair, we took our several ways homewards. Before twelve o'clock the next day I was posting to Gosport, accompanied by my father, but not till after I had obtained, through the agency of my soft-hearted sister, a farewell interview with Ellen, when we of course made fervent vows of mutual fidelity—affirmed and consecrated, at Ellen's suggestion, by the mystical ceremony of breaking a crooked sixpence in halves—a moiety to be worn by each of us about our necks, as an eternal memorial and pendant protest against the flinty hearts of fathers.

This boyish fancy faded but slowly and lingeringly away with the busy and tumultuous years which passed over my head, till the peace of 1815 cast me an almost useless sea-waif upon the land, to take root and vegetate there as I best might upon a lieutenant's half-pay. My father had died about two years before, and the hundred a year he left us was scarcely more than sufficient for the support of my sister, whose chances of an eligible marriage had vanished with her comeliness,

which a virulent attack of smallpox had utterly destroyed, though it had in nothing changed the patient sweetness of her disposition, and the gentle loving spirit that shone through all its disfiguring scars and seams. I had never heard directly from Ellen Dible, although, during the first months of separation, I had written to her many times; the reason of which was partially explained by a few lines in one of Jane's letters, announcing Ellen Dible's marriage—it seemed under some kind of moral compulsion—to a person of her own grade, and their removal from Itchen. This happened about six months after my last interview with her. I made no further inquiries, and, Jane thinking the subject might be a painful one, it happened that, by a kind of tacit understanding, it was never afterwards alluded to between us.

The utter weariness of an idle shore life soon became insupportable, and I determined to solicit the good offices of Sir Joseph Yorke with the Admiralty. The gallant admiral had now taken up his permanent residence near Hamble, a village on the river of that name, which issues into the Southampton water not very far from opposite Calshot Castle. Sir Joseph was drowned there about eight or nine years after I left the station. A more perfect gentleman, let me pause a moment to say, or a better seaman, than Sir Joseph, never, I believe, existed; and of a handsome, commanding presence too—'half-way up a hatchway' at least, to use his own humorous self-description, his legs scarcely corresponding in vigorous outline to the rest of his person. He received me with his usual frank urbanity, and left him provided with a letter to the secretary of the Admiralty—the ultimate and not long-delayed result of which was my appointment to the command of the *Rose* revenue-cutter, the duties attached to which consisted in carefully watching, in the interest of His Majesty's customs, the shores of the Southampton river, the Solent sea, the Wight, and other contiguous portions of the seaboard of Hants and Dorset.

The ways of smugglers were of course new to me; but we had several experienced hands on board, and as I zealously applied myself to the study of the art of contraband, I was not long in acquiring a competent knowledge of the traditional contrivances employed to defraud the revenue. Little of interest occurred during the first three or four weeks of my novel command, except that by the sharpened vigilance of our look-out, certain circumstances came to light, strongly indicating that Barnaby Diaper, the owner of a cutter-rigged fishing-vessel of rather large burthen, living near Hamble Creek, was extensively engaged in the then profitable practice of running moonshine, demandingly and industriously as, when ashore, he appeared to be, everlastingly mending his nets, or cobbling the bottom of the smack's boat. He was a hale, wiry fellow this Barnaby—Old Barnaby, as he was familiarly called, surnames in those localities being seldom used—with a wooden stolidity of countenance which utterly defied scrutiny if it did not silence suspicion. His son, who was a partner in the cutter, lived at Weston, a beautifully-situated hamlet between Itchen and Netley. A vigilant watch was consequently kept upon the movements of the Barnabys, father, son, and grandson—the last a smart, precocious youngster, I understood, of about sixteen years of age, by which family trio the suspicious *Blue-eyed Maid* was, with occasional assistance, manned, sailed, and worked. Very rarely, indeed, was the *Blue-eyed Maid* observed to be engaged in her ostensible occupation. She would suddenly disappear, and as suddenly return, and always, we soon came to notice, on the nights when the *Rose* happened to be absent from the Southampton waters.

We had missed her for upwards of a week, when information reached us that a large lugger we had chased without success a few nights previously would attempt to run a cargo at a spot not far from Lymp-

ton, soon after midnight. I accordingly, as soon as darkness had fallen, ran down, and stood off and on, within signal-distance of the shore-men with whom I had communicated, till dawn, in vain expectation of the promised prize. I strongly suspected that we had been deceived; and on rounding Calshot Castle on our return, I had no doubt of it, for there, sure enough, was the *Blue-eyed Maid* riding lightly at anchor off Hamble Creek, and from her slight draught of water it was quite evident that her cargo, whatever it might have consisted of, had been landed, or otherwise disposed of. They had been smart with their work, for the summer night and our absence had lasted but a few hours only. I boarded her, and found Old Barnaby, whom I knew by sight, and his two descendants, whom I had not before seen, busily engaged swabbing the cutter's deck, and getting matters generally into order and ship-shape. The son a good deal resembled the old man, except that his features were a much more intelligent and good-humoured expression; and the boy was an active, bold-eyed, curly-headed youngster, whose countenance, but for a provoking sauciness of expression apparently habitual to him, would have been quite handsome. I thought I had seen his face somewhere before, and he, I noticed, suddenly stopped from his work on hearing my name, and looked at me with a smiling but earnest curiosity. The morning's work had, I saw, been thoroughly performed; and as I was in no humour for a profitless game of cross questions and crooked answers, I, after exchanging one or two colloquial courtesies, in which I had by no means the advantage, returned to the *Rose* more than ever satisfied that the interesting family I had left required and would probably repay the closest watchfulness and care.

On the evening of the same day the *Blue-eyed Maid* again vanished: a fortnight slipped by, and she had not reappeared; when the *Rose*, having slightly grazed her bottom in going over the shifting shingle at the north-west of the Wight, went into Portsmouth harbour to be examined. Some of her copper was found to be stripped off; there were other trifling damages; and two or three days would elapse before she could be got ready for service. This interval I spent with my sister. The evening after I arrived at Itchen, Jane and I visited Southampton, and accompanied an ancient female acquaintance residing in Bugle Street—a dull, grass-grown place in those days, whatever it may be now—to the theatre in, I believe, the same street. The performances were not over till near twelve o'clock, and after escorting the ladies home, I wended my way towards the Sun Inn on the quay, where I was to sleep—my sister remaining for the night with our friend. The weather, which had been dark and squally an hour or two before, was now remarkably fine and calm; and the porter of the inn telling me they should not close the house for some time longer, I strolled towards the Platform Battery, mounted by a single piece of brass ordnance overlooking the river, and pointing menacingly towards the village of Hythe. The tide was at the full, and a faint breeze slightly rippled the magnificent expanse of water which glanced and sparkled in the bright moon and starlight of a cloudless autumn sky. My attention was not long absorbed by the beauty of the scene, peerless as I deemed it; for unless my eyes strangely deceived me, the *Blue-eyed Maid* had returned, and quietly anchored off Weston. She appeared to have but just brought up; for the main-mast, three new patches in which chiefly enabled me to recognise her, was still flapping in the wind, and it appeared to me—though from the distance, and the shadow of the dark background of woods in which she lay, it was difficult to speak with certainty—that she was deeply laden. There was not a moment to be lost; and fortunately, just in the nick of time, a boat with two watermen approached the platform steps. I tendered them a guinea to put me on board the smack off

Weston—an offer which they eagerly accepted; and I was soon speeding over the waters to her. My uniform must have apprised the Barnabys of the nature of the visit about to be paid them; for when we were within about a quarter of a mile of their vessel, two figures, which I easily recognised to be Old Barnaby and his grandson, jumped into a boat that had been loading alongside, and rowed desperately for the shore, but at a point considerably further up the river, towards Itchen. There appeared to be no one left on board the *Blue-eyed Maid*, and the shore-confederates of the smugglers did not shew themselves, conjecturing, doubtless, as I had calculated they would, upon my having plenty of help within signal call. I therefore determined to capture the boat first, and return with her to the cutter. The watermen, excited by the chase, pulled with a will, and in about ten minutes we ran alongside the Barnabys' boat, jumped in, and found her loaded to the gunwale with brandy kegs.

'Fairly caught at last, old fellow!' I exclaimed exultingly, in reply to the maledictions he showered on us. 'And now pull the boat's head round, and make for the *Blue-eyed Maid*, or I'll run you through the body.'

'Pull her head round yourself,' he sullenly rejoined, as he rose from the thwart and unshipped his oar. 'It's bad enough to be robbed of one's hard earnings without helping the thieves to do it.'

His refusal was of no consequence: the watermen's light skiff was made fast astern, and in a few minutes we were pulling steadily towards the still motionless cutter. Old Barnaby was fumbling among the tubs in search, as he growled out, of his pea-jacket; his hopeful grandson was seated at the stern whistling the then popular air of the 'Woodpecker' with great energy and perfect coolness; and I was standing with my back towards them in the bow of the boat, when the stroke-oarsman suddenly exclaimed: 'What are you at with the boat's painter, you young devil's cub?' The quick mocking laugh of the boy, and the words, 'Now, grandfather, now!' replied to him. Old Barnaby sprang into the boat which the lad had brought close up to the stern, pushing her off as he did so with all his strength; and then the boy, holding the painter or boat-rope, which he had detached from the ring it had been fastened to, in his hand, jumped over the side; in another instant he was hauled out of the water by Old Barnaby, and both were seated and pulling lustily, and with exulting shouts, round in the direction of the *Blue-eyed Maid*, before we had recovered from the surprise which the suddenness and completeness of the trick we had been played excited. We were, however, very speedily in vigorous chase; and as the wind, though favourable, and evidently rising, was still light, we had little doubt of success, especially as some precious minutes must be lost to the smuggler in getting underweigh, neither jib nor foresail being as yet set. The watermen bent fiercely to their oars; and heavily laden as the boat was, we were beginning to slip freely through the water, when an exclamation from one of the men announced another and more perilous trick that the Barnabys had played us. Old Barnaby, in pretending to fumble about for his jacket, had contrived to unship a large plug expressly contrived for the purpose of sinking the boat whenever the exigencies of their vocation might render such an operation advisable; and the water was coming in like a sluice. There was no help for it, and the boat's head was immediately turned towards the shore. Another vociferous shout rang in our ears as the full success of their scheme was observed by the Barnabys, replied to of course by the furious but impotent execrations of the watermen. The boat sank rapidly; and we were still about a hundred yards from the shore when we found ourselves splashing about in the water, which fortunately was not more than up to the armpits of the shortest

of us, but so full of strong and tangled seaweed, that swimming was out of the question; and we had to wade slowly and painfully through it, a step on a spot of more than usually soft mud plumping us down every now and then over head and ears. After reaching the shore and shaking ourselves, we found leisure to look in the direction of the *Blue-eyed Maid*, and had the exquisite pleasure of seeing her glide gracefully through the water as she stood down the river, impelled by the fast-freshening breeze, and towing the watermen's boat securely at her stern.

There were no means of pursuit; and after indulging in sundry energetic vocables hardly worth repeating, we retreated in savage discomfiture towards Weston, plentifully sprinkling the grass and gravel as we slowly passed along; knocked up the landlord of a public-house, and turning in as soon as possible, happily exchanged our dripping attire for warm blankets and clean sheets, beneath the soothing influence of which I, for one, was soon sound asleep.

Day had hardly dawned when we were all three up, and overhauling the mud and weeds—the tide was quite gone out—for the captured boat and tubs. They had vanished utterly: the fairies about Weston had spirited them away while we slept, leaving no vestige whatever of the spoil to which we had naturally looked as some trifling compensation for the night's mishap, and the loss of the watermen's boat, to say nothing of the sousing we had got. It was a bad business certainly, and my promise to provide my helpmates with another boat, should their own not be recovered, soothed but very slightly their sadly-ruffled tempers. But lamentations were useless, and, after the lugubrious expression of a dismal hope for better luck next time, we separated.

This pleasant incident did not in the least abate my anxiety to get once more within hailing distance of the Barnabys; but for a long time my efforts were entirely fruitless, and I had begun to think that the *Blue-eyed Maid* had been permanently transferred to another and less-vigilantly watched station, when a slight inkling of intelligence dispelled that fear. My plan was soon formed. I caused it to be carelessly given out on shore that the *Rose* had sprung her bowsprit in the gale a day or two before, and was going the next afternoon into Portsmouth to get another. In pursuance of this intention, the *Rose* soon after noon slipped her moorings, and sailed for that port; remained quietly there till about nine o'clock in the evening, and then came out under close-reefed storm canvas, for it was blowing great guns from the northward, and steered for the Southampton River. The night was as black as pitch; and but for the continuous and vivid flashes of lightning, no object more than a hundred yards distant from the vessel could have been discerned. We ran up abeam of Hythe without perceiving the object of our search, then tacked, stood across to the other side, and then retraced our course. We were within a short distance of Hamble River, when a prolonged flash threw a ghastly light upon the raging waters, and plainly revealed the *Blue-eyed Maid*, lying-to under the lee of the north shore, and it may be about half a mile ahead of us. Unfortunately she saw us at the same moment, and as soon as way could be got upon her she luffed sharply up, and a minute afterwards was flying through the water in the hope of yet escaping her unexpected enemy. By edging away to leeward I contrived to cut her off effectually from running into the Channel by the Needles passage; but nothing daunted, she held boldly on without attempting to reduce an inch of canvas, although, from the press she carried, fairly buried in the sea. Right in the course she was steering, the *Donegal*, a huge eighty-gun ship, was riding at anchor off Spithead. Old Barnaby, who, I could discern by his streaming white hairs, was at the helm, in his anxiety to keep as well to windward of us

as possible, determined, I suppose, to pass as closely as he prudently could under the stern of the line-of-battle ship. Unfortunately, just as the little cutter was in the act of doing so, a furious blast of wind tore away her jib as if it had been cobweb; and, pressed by her large mainsail, the slight vessel flew up into the wind, meeting the *Donegal* as the huge ship drove back from a strain which had brought her half way to her anchors. The crash was decisive, and caused the instant disappearance of the unfortunate smuggler. The cry of the drowning men, if they had time to utter one, was lost amid the raging of the tempest; and although we threw overboard every loose spar we could lay hands on, it was with scarcely the slightest hope that such aid could avail them in that wild sea. I tacked as speedily as possible, and repassed the spot; but the white foam of the waves, as they leaped and dashed about the leviathan bulk of the *Donegal*, was all that could be perceived, eagerly as we peered over the surface of the angry waters. The *Rose* then stood on, and in little more than an hour afterwards was safely anchored off Hythe.

The boy Barnaby, I was glad to hear a day or two afterwards, had not accompanied his father and grandfather in the last trip made by the *Blue-eyed Maid*, and had consequently escaped the fate which had so suddenly overtaken them, and for which it appeared that the smuggling community held me morally accountable. This was to be expected; but I had too often and too lately been familiar with death at sea in every shape, by the rage of man as well as that of the elements, to be more than slightly and temporarily affected by such an incident; so that all remembrance of it would probably have soon passed away but for an occurrence which took place about a month subsequently. One of the officers of the shore-force received information that two large luggers, laden with brandy and tobacco from Guernsey, were expected the following night on some point of the coast between Hamble and Weston; and that as the cargoes were very valuable, a desperate resistance to the coast-guard, in the event of detection, had been organised. Our plan was soon arranged. The *Rose* was sent away with barely enough of men to handle her, and with the remainder of the crew, I, as soon as night fell, took up a position a little above Netley Abbey. Two other detachments of the coast-guard were posted along the shore at intervals of about a mile, all of course connected by signal-men not more than a hundred yards apart. There was a faint starlight, but the moon would not rise till near midnight; and from this circumstance, as well as from the state of the tides, we could pretty well calculate when to expect our friends, should they come at all. It was not long before we were quite satisfied from the stealthy movements of a number of persons about the spot, that the information we had received was correct. Just after eleven o'clock a low, peculiar whistle, taken up from distance to distance, was heard; and by placing our ears to the ground, the quick jerk of oars in the rullocks was quite apparent. After about five minutes of eager restlessness, I gave the impatiently-expected order; we all emerged from our places of concealment, and with cautious but rapid steps advanced upon the by this time busy smugglers. The two luggers were beached upon the soft sand or mud, and between forty and fifty men were each receiving two three-gallon kegs, with which they speeded off to the carts in waiting at a little distance. There were also about twenty fellows ranged as a guard, all armed as efficiently as ourselves. I gave the word; but before we could close with the astonished desperadoes, they fired a pistol volley, by which one seaman, John Batley, a fine, athletic young man, was killed, and two others seriously wounded. This done, the scoundrels fled in all directions, hotly pursued of course. I was getting near one of them, when a lad, who was running by his side,

suddenly turned, and raising a pistol, discharged it at my head. He fortunately missed his mark, though the whistle of the bullet was unpleasantly close. I closed with and caught the young rascal, who struggled desperately, and to my extreme surprise, I had almost written dismay, discovered that he was young Barnaby! It was not a time for words, and hastily consigning the boy to the custody of the nearest seaman, with a brief order to take care of him, I resumed the pursuit. A bootless one it proved. Favoured by their numbers, their perfect acquaintance with the hedge-and-ditch neighbourhood, the contrabandists all contrived to escape. The carts also got off, and our only captures were the boy, the luggers, which there had been no time to get off, and their cargoes, with the exception of the few kegs that had reached the carts.

The hunt after the dispersed smugglers was continued by the different parties who came in subsequently to our brush with them, so that after the two wounded seamen had been carried off on litters, and a sufficient guard left in the captured boats, only two men remained with me. The body of John Batley was deposited for the present in one of the luggers, and then the two sailors and myself moved forward to Ichen with the prisoner, where I intended to place him in custody for the night.

The face of the lad was deadly pale, and I noticed that he had been painfully affected by the sight of the corpse; but when I addressed him, his expressive features assumed a scornful, defying expression. First ordering the two men to drop astern out of hearing, I said: 'You will be hanged for your share in this night's work, young man, depend upon it.'

'Hanged!' he exclaimed in a quick, nervous tone; 'hanged! You say that to frighten me! It was not I who shot the man! You know that; or perhaps,' he added with a kind of hysterical cry, 'perhaps you want to kill me as you did father.'

'I have no more inclination, my poor boy,' I answered, 'to injure you than I had to harm your father. Why, indeed, should I have borne him any ill-will?'

'Why should you? Oh I know very well!'

'You know more than I do then; but enough of this folly. I wish, I hardly know why, to save you. It was not you, I am quite aware, that fired the fatal shot, but that makes no difference as to your legal guilt. But I think if you could put us on the track of your associates, you might yourself escape.'

The lad's fine eyes perfectly lightened with scorn and indignation: 'Turn informer!' he exclaimed. 'Betray them that loved and trusted me! Never—if they could hang me a thousand times over!'

I made no answer, and nothing more was said till we had reached and were passing the Abbey ruins. The boy then abruptly stopped, and with quivering voice, whilst his eyes filled with tears, said: 'I should like to see my mother.'

'See your mother! There can be no particular objection to that; but she lives further on at Weston, does she not?'

'No, we have sold off, and moved to Aunt Diaper's, at Netley, up yonder. In a day or two we should have started for Hull, where mother's father's brother lives, and I was to have been 'prenticed to the captain of a Greenland; but now,' he continued with an irrepressible outburst of grief and terror, 'Jack Ketch will, you say, be my master, and I shall be only 'prenticed to the gallows.'

'Why, if this be so, did your mother permit you to join the lawless desperadoes to whom you owe your present unhappy and degraded position?'

'Mother did not know of it; she thinks I am gone to Southampton to inquire about the day the vessel sails for Hull. Mother will die if I am hanged!' exclaimed the lad with a renewed burst of passionate grief; 'and surely you would not kill her!'

'It is not very likely I should wish to do so, considering that I have never seen her.'

'Oh yes—yes, you have!' he sharply rejoined. 'Then perhaps you do not know! Untie or cut these cords,' he added, approaching close to me and speaking in a low, quick whisper; 'give me a chance: mother's girl's name was Ellen Dible!'

Had the lad's fettered arm been free, and he had suddenly dealt me a blow with a knife or dagger, the stroke could not have been more sharp or terrible than these words conveyed.

'God of mercy!' I exclaimed, as the momentarily-arrested blood again shot through my heart with reactive violence, 'can this be true?'

'Yes, yes—true, quite true!' continued the boy, with the same earnest look and low, hurried speech. 'I saw, when your waistcoat flew open in the struggle just now, what was at the end of the black ribbon. You will give me a chance for mother's sake, won't you?'

A storm of grief, regret, remorse, was sweeping through my brain, and I could not for a while make any answer, though the lad's burning eyes continued fixed with fevered anxiety upon my face.

At last I said, gasped rather: 'I cannot release you—it is impossible; but all that can be done—all that can—can legally be done, shall be.' The boy's countenance fell, and he was again deadly pale. 'You shall see your mother,' I added. 'Tell Johnson where to seek her; he is acquainted with Netley.' This was done, and the man walked briskly off upon his errand.

'Come this way,' I said, after a few minutes' reflection, and directing my steps towards the old ruined fort by the shore, built, I suppose, as a defence to the abbey against pirates. There was but one flight of steps to the summit, and no mode of egress save by the entrance from whence they led. 'I will relieve you of these cords while your mother is with you. Go up to the top of the fort. You will be unobserved, and we can watch here against any foolish attempt at escape.'

Ten minutes had not elapsed when the mother, accompanied by Johnson, and sobbing convulsively, appeared. Roberts hailed her, and after a brief explanation, she ascended the steps with tottering but hasty feet, to embrace her son. A quarter of an hour, she had been told, would be allowed for the interview.

The allotted time had passed, and I was getting impatient, when a cry from the summit of the fort or tower, as if for help to some one at a distance, roused and startled us. As we stepped out of the gateway, and looked upwards to ascertain the meaning of the sudden cry, the lad darted out and sped off with surprising speed. One of the men instantly snatched a pistol from his waistbelt, but at a gesture from me put it back. 'He cannot escape,' I said. 'Follow me, but use no unnecessary violence.' Finding that we gained rapidly upon him, the lad darted through a low, narrow gateway, into the interior of the abbey ruins, trusting, I imagined, to baffle us in the darkness and intricacy of the place. I just caught sight of him as he disappeared up a long flight of crumbling, winding steps, from which he issued through a narrow aperture, upon a lofty wall, some five or six feet wide, and overgrown with grass and weeds. I followed in terrible anxiety, for I feared that in his desperation he would spring off and destroy himself. I shouted loudly to him for God's sake to stop. He did so within a few feet of the end of the wall. I ran quickly towards him, and as I neared him he fell on his knees, threw away his hat, and revealed the face of—Ellen Dible!

I stopped, bewildered, dizzy, paralysed. Doubtless the mellowing radiance of the night softened or concealed the ravages which time must have imprinted on her features; for as I gazed upon the spirit-beauty of her upturned, beseeching countenance, the old time came back upon me with a power and intensity which

an hour before I could not have believed possible. The men hailed repeatedly from below, but I was too bewildered, too excited, to answer: their shouts, and the young mother's supplicating sobs—she seemed scarcely older than when I parted from her—sounded in my ears like the far-off cries and murmurs of a bewildering, chaotic dream. She must have gathered hope and confidence from the emotion I doubtless exhibited, for as soon as the confusion and ringing in my brain had partially subsided, I could hear her say: 'You will save my boy—my only son: for my sake you will save him?'

Another shout from the men below demanded if I had got the prisoner. 'Ay, ay,' I mechanically replied, and they immediately hastened to join us.

'Which way—which way is he gone?' I asked as the seamen approached.

She instinctively caught my meaning: 'By the shore to Weston,' she hurriedly answered; 'he will find a boat there.'

The men now came up: 'The chase has led us astray,' I said: 'look there.'

'His mother, by jingo!' cried Johnson. 'They must have changed clothes!'

'Yes: the boy is off—to—to Hamble, I have no doubt. You both follow in that direction: I'll pursue by the Weston and Itchen road.'

The men started off to obey this order, and as they did so, I heard her broken murmur of 'Bless you, Robert—bless you!' I turned away, faint, reeling with excitement, muttered a hasty farewell, and with disordered steps and flaming pulse hurried homewards. The mother I never saw again: the son at whose escape from justice I thus weakly, it may be criminally, connived, I met a few years ago in London. He is the captain of a first-class ship in the Australian trade, and a smarter sailor I think I never beheld. His mother is still alive, and lives with her daughter-in-law at Chelsea.

A BIBLIOGRAPHIC CURIOSITY.

PUBLISHERS in this country are very much in the habit of congratulating themselves on the magnitude of their undertakings. We do not disparage the efforts of this class of tradesmen, but it is proper they should know that not one of them has produced works of such grandeur as have issued from foreign houses. A very remarkable exemplification of continental enterprise, such as we have never been able to match, is found in an Atlas published by the Bleaus of Amsterdam about two centuries ago; and of this now rare and curious work we desire to offer some account.

Bleaus's Atlas is a collection of maps of a large folio size, comprehended in fourteen volumes—think of an atlas in fourteen volumes folio, Mr English mapseller!—and these volumes, bound in old vellum, profusely but tastefully gilded, usually occupy the lower shelves in some little-frequented part of public libraries. Few libraries, indeed, can boast the possession of a Bleau; for much of the original impression was unfortunately destroyed by fire in the premises of the publishers, and few sets of this great work reached this country. The British Museum has probably one; that which we have seen rests in an obscure nook of the Advocates' Library in Edinburgh, not discovered by ordinary visitors.

This marvellously fine old atlas consists not exclusively of maps, but combines a system of geography and topography which, according to the knowledge of the period, left little to be desired. The extent and minuteness of the information conveyed, along with the finish and accuracy of the maps, fill us with admiration of the industry and enterprise of the Dutch pub-

lishers of the seventeenth century. The Bleaus were great men of their day. They were two in number, father and son; the former named William, the latter John, Bleau—or as the name is Latinised, Blavina. William Bleau was born in 1571, and died in 1688, leaving but a small part of his great work completed. It was continued by his son, who issued the last volume, containing the general cosmography, in 1665. Like the Elzevirs and other Dutch publishers of that day, the Bleaus were great scholars, and took a leading share in the literary department of their works, surrounding themselves with a band of able assistants. Their geography and science are both, it will readily be believed, imperfect enough when measured by the modern estimate. But it was not the fashion then to stick to pure scientific details. Writers gave out all that could be said, and sometimes all that could be imagined, on any subject discussed by them: so the geographical details of this eminent work are filled with notices of national manners and customs, and of superstitions; with anecdotes of distinguished personages, curious events in history, and the like—all told in a Latinity which varies in its purity with the various authors who had to compose the separate parts. We know scarcely any work where an investigator of curious legendary lore is more likely to be repaid.

It may be questioned whether it may have been favourable to the student of geography in those days, but it is very amusing to the lounging investigator of the present, to study the groups of allegorical figures which surround the maps. The Dutch, if it be denied that they reached the higher developments of the fine arts, could never tolerate positively bad art. All the drawing and colouring is therefore well executed, some of it of at least a high, though not the highest, style of art; and so we have group after group of venerable bearded men, or of chubby Dutch babies, and comely but perhaps hardly elegant Dutch women. With a ring of such personages, with angels and mythological beings interwoven, the first geographical map of the series—the two hemispheres—is surrounded. It surprises the observer by a closer resemblance than he is prepared to expect to the maps of the world in the nineteenth century. The general contour is so like, that it would require considerable geographical knowledge to note the discrepancies. America, for instance, appears to be quite accurately laid down; but on close inspection it appears that California is an island, and the outline is shadowed off as it approaches the Oregon territory. The outline of Australia is not completed, and the end merely of Van Diemen's Land is seen in the far ocean, shaded off into vagueness; but for a century afterwards it was not better represented in our maps, and it surprises one that in so early a publication any faint image of New Zealand should be given—an indistinct line of coast with the name Zelandia Nova.

In the same volume, commonly placed as the first of the series, there is an extremely curious set of plates, all the more interesting that they have scarcely a legitimate place there. They are connected with the lonely island of Hwen, and the observatory which Tycho Brahe, by the munificence of his prince, was enabled to erect there. The elder Bleau was a pupil of Tycho, worked with him in his observatory, and seems to have been led by a feeling of reverence to commemorate the master and the scene of his triumphant labours. The edifice was called Uraniburg, or the City of the Stars; and from the views and elevations preserved by the geographer, it may be seen that it was truly a palace. The inner building consists of a cluster of towers and pinnacles in that mixture of Gothic and classic which we see in Heriot's Hospital at Edinburgh, and the Fredericksburg Palace in Denmark. Indeed, the building has a striking resemblance to Heriot's Hospital, and one could imagine it to be designed by the same artist,

whoever he may have been. The style seems, curiously enough, to have been peculiar to Scotland and Denmark. From the four corners of the edifice four avenues pass through rich garden-grounds, all in symmetrical patterns, which occupy the nearest space round the palace of science. Next after these come shrubberies, with quaint and highly-decorated little edifices in them, which might be supposed to be pleasure-houses, but probably were devoted to some of the scientific purposes of the establishment. Outside of all, and including apparently a wide area, is a great strong wall with bastions. Surely the illustrious astronomer did not require to be fortified from external attack while he read the stars? It is probable that the fortification, like the sentinel at some great official person's door, was intended to impose awe, and mark the high respect of the monarch for the philosopher. Such, as exhibited to us in these magnificent plates, is the character of a building of which we believe some mouldering fragments still remain. But the most interesting of all these illustrations shews us, by a panoramic view of the interior, the philosopher himself in the middle of his labours. Perched in their several departments, the assistants are grouped together, making observations with the instruments, or preparing reports, while Tycho, as the lord of all, sits on a chair of state in the centre—calm, majestic, magnificently attired, but with the greater magnificence of commanding intellect in his countenance. The age of forty is that at which the artist professes to represent him; but the grizzled beard and deep furrows on the brow and cheeks would indicate a more advanced period of life.

A very interesting volume of this great work contains the plans of cities, chiefly in the Netherlands and Northern Germany. They are very full and minute, but they have an interest even beyond their topographical importance in the curious representations of local and domestic customs. The Dutchman's garden is laid out before us to the minutest tulip. Here is a game at bowls, there a party assembled in the luthaus or pleasure-house. The human figure is represented in every variety of the costume of the age; and as if the artist desired to give us an opportunity of knowing everything, he spreads before us the contents of a bleaching-green. Clean linen was scarcely at that time known throughout the rest of Europe, but there we see spread out, just as they might be at the present day, the shirts, great and small, of the several grades of the family. In all domestic arrangements the Netherlands have been a century in advance of the rest of the world; and it is perhaps to their pride in this civilisation that we may attribute the disposition of the Dutch to make the world so well acquainted through art with their domestic habits. Philip de Comines tells us, that when the Count Palatine of the Rhine visited the Duke of Burgundy at Brussels, 'the duke's servants upbraided the Germans for their nastiness and incivility in laying their dirty clothes and their boots upon these rich beds, and accusing them of want of neatness and consideration.' And there, according to the chronicler, arose a national quarrel.

Scotland would not at that time have so easily borne a minute exposition of its domestic arrangements; yet perhaps the volume dedicated to that country is the most interesting department of Bleau's Atlas. It contains a series of maps, partly in counties—as Forfar and Aberdeen; partly in provinces—as Teviotdale, Lennox, &c. They are extremely full and minute, affording a store of topographical knowledge of the most valuable kind, enhanced by a very copious letterpress description. The names of places are professedly given in Latin, and in the manner in which the translation has been effected is in some instances rather curious. Thus we have Godscroft transformed into *Theager*, Horsburgh into *Hypocauston*, and Smithfield into *Fabri-*

campum. This department of the Atlas was committed to the charge of a Scottish gentleman distinguished for his birth as well as his abilities—Sir Robert Gordon of Straloch. It was a time when art and literature lived much by royal patronage and distinction, and Bleau applied to Charles I. to appoint a proper person to superintend the Atlas of Scotland. The king appointed Gordon, issuing a rescript to this effect: 'Having lately seen certain charts of divers shires of this our ancient kingdom, sent here from Amsterdam to be corrected and helpit in the defects thereof, and being informed of your sufficiency in that art, and of your love both to learning and to the credit of your nation, we have therefore thought fit hereby earnestly to entreat you to take so much pains as to revise the said charts, and to help them in such things as you find deficient therein, until, that they may be sent back by the direction of our chancellor to Holland; which, as the same will be honourable for yourself, so shall it do us good and acceptable service; and if occasion present, we shall not be unmindful thereof. From our Palace at Holyrood House, the 8th October 1641.' So important were his labours deemed, that Gordon was specially protected by both parties during the wild times of the civil wars, and was by a truly marvellous generosity excused from taking a side. A special act of parliament was passed to exempt him from subsidies and quartering of soldiers, and many orders were issued to protect him from the rapacity or tyranny of the commanders of troops. Thus in the midst of this wild turmoil the geographer and statist quietly went on with his work. He preserved his strict neutrality; and perhaps he was all the more successful in doing so after the ascendancy of the Covenanters, since he was at heart a Cavalier. There are many curious antiquarian inquiries in Gordon's portion of the Atlas. He is the author of a history of his family, and it was for some time understood that he had left behind him the history of his own times. A manuscript in two folio volumes, in the Advocates' Library, was long believed to be the identical work, and stands lettered on the back 'Straloch's MS.' It was since discovered, however, that this was a compilation by a writer named Man, the editor of an edition of Buchanan's History, who had intended to publish it as a history of the great civil war. It had so far a connection with Gordon of Straloch, that it was chiefly compiled from a manuscript left by his son Thomas Gordon, parson of Rothiemay. A manuscript of Thomas Gordon's own work has been discovered, and it has been printed for the Spalding Club, under the title, 'History of Scots Affairs from 1637 to 1641.'

To return to the Atlas. We have stated that the Scottish maps are very full and minute. Their history is curious, and goes farther back than Gordon's connection with the work. Timothy Pont, of whom little more is known than that his father was a judge of the Court of Session, and that he was an enthusiast in topography, left behind him a quantity of maps and draughts of various parts of Scotland. Sir Robert Sibbald, a man of kindred habits and acquirements, in a note-book about Scottish authors left among his manuscripts, states that Pont took long pedestrian journeys to acquire his topographical information. Bishop Nicholson says of him, that 'he was by nature and education a complete mathematician, and the first projector of a Scotch atlas. To that great purpose he personally surveyed all the several counties and isles of the kingdom, took draughts of them upon the spot, and added such cursory observations upon the monuments of antiquity and other curiosities as were proper for the furnishing out of future descriptions. He was unfortunately surprised by death, to the incalculable loss of his country, when he had wellnigh finished his papers.' Pont's original draughts are carefully preserved in the Advocates' Library. In the days of the Ordnance Survey, it is interesting to observe these labours of one enthusiastic

and laborious man. They are extremely minute and precise, and give one the idea that they have been the fruit of an enormous amount of personal exertion. It is scarcely possible, indeed, to believe that one man, by actual survey, could have accomplished them. They are of course very valuable as topographical relics, and in one point they are extremely curious, in shewing many places in the Highland districts to have been inhabited which are now deserted. Thus there are many names of farms and villages now unknown, the inhabitants having so long left them that there was none to hand down the name.

WHAT HAS BECOME OF THE PIEMAN?

A PENNY for a pie! In the records of our individual experience, this is probably the most ancient species of barter—the first gentle and welcome induction to the dry details of commerce, and one eminently calculated to impress upon the infant minds of a trading population the primary principles of exchange, of which a *quid pro quo* forms the universal basis. We had imagined, upon the first view of our subject, that the fabrication and consumption of pies must have been a custom as ancient as cookery itself, and have ranked among the very first achievements of the gastronomic art. Upon careful investigation, however, we find ourselves to have been mistaken in this idea. We have not been able to discover among the revelations to which the Rosetta Stone surrendered a key, any authority for supposing that among all the butlers and bakers of all the Pharaohs, there ever existed one who knew how to prepare a pie for the royal banquet. No; it was reserved for the Greeks, the masters of civilisation and the demigods of art, who brought every species of refinement to its highest pitch, to add the invention of pies and pie-crust to the catalogue of their immortal triumphs. Their *agropies* (the word passed unchanged into Roman use) was an aggregation of succulent meats baked in a farinaceous crust, probably somewhat resembling in form a venison pasty of the present day, and was the first combination of the kind, so far at least as we know, ever submitted to the appetite of the gourmand. We have no intention of pursuing the history of this great discovery from its first dawn in some Athenian kitchen to its present universal estimation among all civilised eaters. We must pass the pies of all nations, from the monkey-pie of Central Africa, with the head of the baked semi-homo emerging spectrally from the upper crust, to the *patés* of Strasburg, the abnormally swollen livers of whose tormented geese foam the wide world to avenge upon gluttonous man the infamous tortures inflicted upon their original proprietors: we must pass, too, the thousand-and-one ingenious inventions which adorn the pages of Mrs Glass and Rumbold, by means of which dyspepsias are produced *secundum artem*, and the valetudinarian is accustomed to retard his convalescence according to the most approved and fashionable mode. The great pie of 1850, prepared by the ingenious Soyer, at the cost of a hundred guineas, for the especial delectation of municipal stomachs at York, is, likewise, altogether out of our way. Our business is with the pie that is sold for a penny, and sold in London. Let us add, moreover, that we treat only of the pie which is fairly worth a penny, leaving altogether out of our category the flimsy sophistries of your professed confectioner.

From time immemorial the wandering pieman was a prominent character in the highways and byways

of London. He was generally a merry dog, and was always found where merriment was going on. Furnished with a tray about a yard square, either carried upon his head or suspended by a strap in front of his breast, he scrupled not to force his way through the thickest crowd, knowing that the very centre of action was the best market for his wares. He was a gambler, both from inclination and principle, and would toss with his customers, either by the dallying shilli-shally process of 'best five in nine,' the tricky manœuvre of 'best two in three,' or the desperate dash of 'sudden death!' in which latter case the first toss was destiny—a pie for a halfpenny, or your halfpenny gone for nothing; but he invariably declined the mysterious process of 'the odd man,' not being altogether free from suspicion on the subject of collusion between a couple of hungry customers. We meet with him frequently in old prints; and in Hogarth's 'March to Finchley,' there he stands in the very centre of the crowd, grinning with delight at the adroitness of one robbery, while he is himself the victim of another. We learn from this admirable figure by the greatest painter of English life, that the pieman of the last century perambulated the streets in professional costume; and we gather further, from the burly dimensions of his wares, that he kept his trade alive by the laudable practice of giving 'a good pennyworth for a penny.' Justice compels us to observe, that his successors of a later generation have not been very conscientious observers of this maxim. The varying price of flour, alternating with a sliding-scale, probably drove some of them to their wits' end; and perhaps this cause more than any other operated in imparting that complexion to their productions which made them resemble the dead body of a penny pie, and which in due time lost them favour with the discerning portion of their customers. Certain it is that the perambulating pie business in London fell very much into disrepute and contempt for several years before the abolition of the corn-laws and the advent of free trade. Opprobrious epithets were hurled at the wandering merchant as he paraded the streets and alleys—epithets which were in no small degree justified by the clammy and clay-like appearance of his goods. By degrees the profession got into disfavour, and the pieman either altogether disappeared, or merged in a dealer in foreign nuts, fruits, and other edibles which barred the suspicion of sophistication.

Still the relish for pies survived in the public taste, and the willing penny was as ready as ever to guerdon the man who, on fair grounds, would meet the general desire. No sooner, therefore, was the sliding-scale gone to the dogs, and a fair prospect of permanence offered to the speculator, in the guarantee of something like a fixed cost in the chief ingredient used, than up sprang almost simultaneously in every district of the metropolis a new description of pie-shops, which rushed at once into popularity and prosperity. Capital had recognised the leading want of the age, and brought the appliances of wealth and energy to supply it. Avoiding, on the one hand, the glitter and pretension of the confectioner, and on the other the employment of adulterating or inferior materials, they produced an article which the populace devoured with universal commendation, to the gradual but certain profit of the projectors. The peripatetic merchant was pretty generally driven out of the field by the superiority of the article with which he had to compete. He could not manufacture on a small scale in a style to rival his new antagonists, and he could not purchase of them to sell again, because they would not allow him a living

margin—boasting, as it would appear with perfect truth, that they sold at a small and infinitesimal profit, which would not bear division.

These penny-pie shops now form one of the characteristic features of the London trade in comestibles. That they are an immense convenience as well as a luxury to a very large section of the population, there can be no doubt. It might be imagined, at first view, that they would naturally seek a cheap locality and a low rental. This, however, is by no means the universal practice. In some of the chief lines of route they are to be found in full operation; and it is rare indeed, unless at seasons when the weather is very unfavourable, that they are not seen well filled with customers. They abound especially in the immediate neighbourhood of omnibus and cab stations, and very much in the thoroughfares and short-cuts most frequented by the middle and lower classes. But though the window may be of plate-glass, behind which piles of the finest fruit, joints, and quarters of the best meat, a large dish of silver eels, and a portly china bowl charged with a liberal heap of minced-meat, with here and there a few pies, lie temptingly arranged upon napkins of snowy whiteness, yet there is not a chair, stool, or seat of any kind to be found within. No dallying is looked for, nor would it probably be allowed.

Pay for your pie, and go, seems the order of the day. True, you may eat it there, as thousands do; but you must eat it standing, and clear of the counter. We have more than once witnessed this interesting operation with mingled mirth and satisfaction; nay, what do we care?—take the confession for what it is worth—*pari ipso fatimus*—we have eaten our pies (and paid for them too, no credit being given)—*in loco*, and are therefore in a condition to guarantee the truth of what we record. With few exceptions (we include ourselves among the number), there are no theoretical philosophers among the frequenters of the penny-pie shop. The philosophy of bun-eating, of which an epitome was given in a former number of the Journal, may be very profound, and may present, as we think it does, some difficult points; but the philosophy of penny-pie eating is absolutely next to *nil*. The customer of the pie-shop is a man (if he is not a boy) with whom a penny is a penny, and a pie is a pie, who, when he has the former to spend or the latter to eat, goes through the ceremony like one impressed with the settled conviction that he has business in hand which it behoves him to attend to. Look at him as he stands in the centre of the floor, erect as a grenadier, turning his busy mouth full upon the living tide that rushes along Holborn! Of shame or confusion of face in connection with the enviable position in which he stands he has not the remotest conception, and could as soon be brought to comprehend the differential calculus as to entertain a thought of it. What, we ask, would philosophy do for him? Still every customer is not so happily organised, and so blissfully insensible to the attacks of false shame; and for such as are unprepared for the public gaze, or constitutionally averse from it, a benevolent provision is made by a score of old play-bills stuck against the adverse wall, or swathing the sacks of flour which stand ready for use, and which they may peruse, or affect to peruse, in silence, munching their pennyworths the while. The main body of the pie-eaters are, however, perfectly at their ease, and pass the very few minutes necessary for the discussion of their purchases in bandying compliments with three or four good-looking lasses, the very incarnations of good-temper and cleanly tidiness, who from morn to night are as busy as bees in exulting the pies from their metallic moulds, as they are demanded by the customers. These assistants lead no lazy life, but they are without exception plump and healthy-looking, and would seem (if we are to believe the report of an employer) to have an astonishing tendency to the parish church of the district

in which they officiate, our informant having been bereaved of three by marriage in the short space of six months. Relays are necessary in most establishments on the main routes, as the shops are open all night long, seldom closing much before three in the morning when situated in the neighbourhood of a theatre or a cab-stand. Of the amount of business done in the course of a year it is not easy to form an estimate. Some pie-houses are known to consume as much flour as a neighbouring baker standing in the same track. The baker makes ninety quartern loaves from the sack of flour, and could hardly make a living upon less than a dozen sacks a week; but as the proportion borne by the crust of a penny-pie to a quartern loaf is a mystery which we have not yet succeeded in penetrating, we are wanting in the elements of an exact calculation.

The establishment of these shops has by degrees prodigiously increased the number of pie-eaters and the consumption of pies. Thousands and tens of thousands who would decline the handling of a scalding hot morsel in the public street, will yet steal to the corner of a shop, and in front of an old play-bill, delicately dandling the titbit on their finger-tips till it cools to the precise temperature at which it is so delicious to swallow—'snatch a fearful joy.' The tradesman, too, in the immediate vicinity, soon learns to appreciate the propinquity of the pie-shop, in the addition it furnishes to a cold dinner, and for half the sum it would have cost him if prepared in his own kitchen. Many a time and oft have we dropped in, upon the strength of a general invitation, at the dinner-table of an indulgent bibliophile, and recognised the undeniable *pâté* of 'over the way' following upon the heels of the cold sirloin. With artisans out of work, and with town-travellers of small trade, the pie-shop is a halting-place, its productions presenting a cheap substitute for a dinner. Few purchases are made before twelve o'clock in the day; in fact the shutters are rarely pulled down much before eleven; yet even then business is carried on for nearly twenty hours out of the twenty-four. About noon the current of custom sets in, and all hands are busy till four or five o'clock; after which there is a pause, or rather a relaxation, until evening, when the various bands of operatives, as they are successively released from work, again renew the tide. As these disappear, the numberless nightly exhibitions, lecture-rooms, mechanics' institutes, concerts, theatres and casinos, pour forth their motley hordes, of whom a large and hungry section find their way to the pie-house as the only available resource—the public-houses being shut up for the night, and the lobster-rooms, oyster saloons, 'shades,' 'coal-holes,' and 'cider-cellars,' too expensive for the means of the multitude. After these come the cab-drivers, who, having conveyed to their homes the more moneyed classes of sight-seers and playgoers, return to their stands in the vicinity of the shop, and now consider that they may conscientiously indulge in a refreshment of eel-pies, winding up with a couple of 'fruiters,' to the amount at least of the sum of which they may have been able to cheat their fares.

Throughout the summer months the pie trade flourishes with unabated vigour. Each successive fruit, as it ripens and comes to market, adds a fresh impetus to the traffic. As autumn waxes, every week supplies a new attraction and a delicious variety; as it wanes into winter, good store of apples are laid up for future use; and so soon as Jack Frost sets his cold toes upon the pavement, the delicate odour of mince-meat assails the passer-by, and reminds him that Christmas is coming, and that the pie-man is ready for him. It is only in the early spring that the pie-shop is under a temporary cloud. The apples of the past year are well-nigh gone, and the few that remain have lost their succulence, and are dry and flavourless. This is the precise season when, as the pie-man in 'Pick-

wick' too candidly observed, 'fruits is out, and cats is in.' Now there is an unaccountable prejudice against cats among the pie-devouring population of the metropolis: we are superior to it ourselves, and can therefore afford to mention it dispassionately, and to express our regret that any species of commerce, much more one so grateful to the palate, and so convenient to the purse, should periodically suffer declension through the prevalence of an unfounded prejudice. Certain it is that penny-pie eating does materially decline about the early spring season; and it is certain too, that of late years, about the same season, a succession of fine Tabbies of our own have mysteriously disappeared. Attempts are made with rhubarb to combat the depression of business; but success in this matter is very partial—the generality of consumers being impressed with the popular notion that rhubarb is physic, and that physic is not fruit. But relief is at hand: the showers and sunshine of May bring the gooseberry to market; pies resume their importance; and the pisan, backed by an inexhaustible store of a fruit grateful to every English palate, commences the campaign with renewed energy, and bids defiance for the rest of the year to the mutations of fortune.

We shall close this sketch with a legend of the day, for the truth of which, however, we do not personally vouch. It was related and received with much gusto at an annual supper lately given by a large pie proprietor to his assembled hands:—

Some time since, so runs the current narrative, the owner of a thriving mutton-pie concern, which, after much difficulty, he had succeeded in establishing with borrowed capital, died before he had well extricated himself from the responsibilities of debt. The widow carried on the business after his decease, and thrived so well, that a speculating baker on the opposite side of the way made her the offer of his hand. The lady refused, and the enraged suitor, determined on revenge, immediately converted his baking into an opposition pie-shop; and acting on the principle universal among London bakers, of doing business for the first month or two at a loss, made his pies twice as big as he could honestly afford to make them. The consequence was that the widow lost her custom, and was hastening fast to ruin, when a friend of her late husband, who was also a small creditor, paid her a visit. She detailed her grievance to him, and lamented her lost trade and fearful prospects. 'Ho, ho!' said her friend, 'that 'ere's the move, is it? Never you mind, my dear. If I don't git your trade agin, there aint no snakes, mark me—that's all!' So saying he took his leave.

About eight o'clock the same evening, when the baker's new pie-shop was crammed to overflowing, and the principal was below superintending the production of a new batch, in walks the widow's friend in the costume of a kennel-raker, and elbowing his way to the counter, dabs down upon it a brace of huge dead cats, vociferating at the same time to the astonished damsel in attendance: 'Tell your master, my dear, as how them two makes six-and-thirty this week, and say I'll bring t'other four to-morrer arternoon!' With that he swaggered out and went his way. So powerful was the prejudice against cat-mutton among the population of that neighbourhood, that the shop was clear in an instant, and the floor was seen covered with hastily-abandoned specimens of every variety of segments of a circle. The spirit-shop at the corner of the street experienced an unusually large demand for 'goes' of brandy, and interjectional ejaculations not purely grammatical were not merely audible but visible too in the district. It is avowed that the ingenious expedient of the widow's friend, founded as it was upon a profound knowledge of human prejudices, had the desired effect of restoring 'the balance of trade.' The widow recovered her commerce; the

resentful baker was done as brown as if he had been shut up in his own oven; and the friend who brought about this measure of justice received the hand of the lady as a reward for his interference.

SOUTHERN GATES OF EGYPT.

THERE is scarcely any place in Egypt more picturesque in appearance, or more interesting, than what may be called its Southern Gates—the whole neighbourhood of the first Cataracts. I have read many descriptions thereof executed with great skill, but not one appears to me to convey a correct idea at the same time of the general characteristics of the scene and of the minutest details. It may be that success is impossible, or it may be that travellers have hurried on too rapidly to other classical sites. This last supposition is not unlikely to be true. I have known people 'do' the whole district in twenty-four hours. For my own part, during the period I remained there, new objects of interest, new points of view, seemed perpetually presenting themselves; and when I took my departure, it was with the impression that had I remained twice as long, no yearning for fresh excitement would have arisen.

We had passed through a narrow defile of rock the previous evening, and moored at Akabah, a village celebrated for its dates. The morning came bright and sunny, but cool. A gentle north wind filled the sails, and soon wafted us against the rippling current to within sight of Essouan, or rather of the hills and ruins that overlook it, for the town itself was concealed by palm-groves. A white-walled palace standing alone on the eastern bank, and a great ruined convent half way up the sandy declivity to the west, were the first buildings that appeared near at hand. A slight turn brought us in sight of the point of Stepbantine, its woods and thickets sparkling in the sun, the approach seemingly impossible by reason of the huge black rocks piled as if fragments of a ruined dike across the river. To the right a winding branch strewn with boulders appeared to lead away into the desert; but to the left a long line of boats indicated the mooring ground. The great sail was soon got in; and the forssail flapping took us quietly along between two enormous rocks, covered with hieroglyphics and figures of ancient kings and heroes, into a kind of lake or harbour, defended by breakers on the north; the sandy bank covered with old boats, and backed by trees, on the east; the island on the west; and closing in to the south, so as to leave only a narrow passage between an eminence topped with Saracenic ruins, and the great shattered wall of hewn stone supposed to mark the site of the Nilometer.

There was bustle on the beach: our friends coming to salute us, and point out a convenient place where to 'peg up'; boatmen exchanging salutations; donkeys, with real civilised saddles, and very uncivilised drivers, crowding down for employment; shipwrights hammering; fifty men, with a measured grunt, hauling a boat ashore; further on, a large space covered with bales of merchandise, sheds, and groups of travellers—so that the border town of Egypt, which, by the way, was still not visible, promised to be at least a lively place of halt. It turned out to be so in fact; and I should have no objection to go back and spend a month or so there, breathing the purest air in the world beneath the finest sky.

Every one knows by report that there are two famous islands in this vicinity, separated by several miles of rapids: one above, called Phihe; and one below called Stepbantine. The latter, as I have said, now lay opposite to us, just allowing the white hilly Libyan desert to appear through its groves; but our curiosity was chiefly directed towards the former, and we could scarcely refrain from imitating the native travellers, and hurrying off at once to explore it. There was plenty of time before us, however; and restraining our impetu-

tienco, we resolved to persevere in our old method of making ourselves at home in a place ere we went in quest of its neighbouring objects of attraction.

The modern town of Essouan contains some four or five thousand inhabitants. A principal street, as usual, is devoted to the bazaar—not very remarkable for the richness of the goods exposed for sale. In the neighbourhood, especially to the north, are a variety of dusty-looking gardens divided by dusty lanes; but the general effect is that of barrenness and desolation. To the south is a city of ruins—the ancient Arabic Essouan, with its remains of elegant arched buildings stretching far and wide; and beyond, where the ground rises, the commencement of a vast cemetery. Our first walk was in this direction; and we had soon got clear of the new town and the old, and were in the midst of tombs and black rocks, here and there bearing inscriptions. On the summit of the hill are two mosques—one ruined, and one glaring with fresh whitewash. The latter is sacred to the Seventy-seven Sheiks, and is regarded with peculiar respect both by the residents and all true Moslem travellers. From its neighbourhood a fine view is obtained of the winding course of the Nile to the north; of the desert rising into crags on either side; of the town and its dusty groves; and above all, of the great black valley along which runs the land-route to Phihe. The whole breadth of this valley is covered with shattered mausolea and an infinity of head-stones, generally in good preservation, with long mysterious-looking Cufic inscriptions. Further on to the south, it seems encumbered with isolated rocks that, thickening in the distance, at length close up the view. On the most conspicuous heights around, tombs of saints, ancient and modern, are perched like watch-towers.

We returned through part of the new town, detecting fragments of ancient buildings in the walls of several of the houses; and coming down to the river north of our mooring-ground, examined an old Roman bath that projects like a mole into the water. From this the road or path goes through trees, beneath a huge piece of rock, covered with hieroglyphical inscriptions and figures, not of very finished workmanship, and probably recording the visits of mere travellers like ourselves. It could not but strike us that these ancient pilgrims surpassed in taste the moderns. They chose the face of precipices, the naked sides of water-washed boulders, whereon to write the enduring memorial of their visit. But their more civilised successors chose the most conspicuous part of the most elegant and ornamented monument, and are not content unless the name of Smith defaces an oval, or destroys the expressive touches which mark the countenance of Isis or Osiris.

Next day we resolved to extend the circle of our wanderings, and started again southwards. This time we traversed the whole length of the cemetery along the centre of the valley, gazing with admiration at the elegant cupolas, finely-turned arches, and graceful pillars, which, though now all broken and deserted, testified amply to the taste that had presided over their creation. One of the innumerable headstones that dot the ground appeared recently shattered by a musket-bullet. There was a story put to the purpose: A Turkish soldier, in a fit of drunken impiety, had fired at the stone; but even before the missile had sped to its mark, he had fallen down dead, slain by the spirit of the buried sheik—for none but holy men lie in this ground. A friend explained that the story had its origin in a true occurrence, of which the hero was a Frank traveller. He had fired last year at a crow, broken the stone by accident, and his gun bursting, he lost the use of his hand. This matter-of-fact statement would have satisfied me, but I find that in reality the anecdote is an old one, being mentioned by writers twenty years ago.

Having got beyond the tombs, we found the country become more wild and savage at every step. Not a tree, not a shrub, not a blade of grass, not a lichen met the eye. All was black, crumbly rock on every side. Beneath our feet was sand. The hills, broken into fantastic shapes, formed hollows, ravines, valleys, winding away in inextricable confusion. We seemed to have got into the extinguished crater of a vast volcano. Yet there was nothing horrid in the scene, because the unclouded sun was there, streaming down its dazzling light on every object, and imparting, as it were, life to desolation. A vulture now and then sailed heavily from crag to crag; two or three hawks ascended in their spiral flight; a dozen or so of glossy black crows looked pertly at us from boulders bearing the names of the Pharaohs, or strutted with an air of assumed gentility on the ground; and some small black and white birds, with sparrows and desert larks, fluttered in busy idleness about.

We turned off at length to the right into a rugged ravine that seemed to lead nowhere. But after scrambling along for some time, we actually saw the tops of some waving palms rising, it seemed, out of a fissure in the earth; and presently getting to the summit of the pass, came in full view of a little village of little houses, surrounded by little gardens, nestling in the midst of horrid inky rocks, on the borders, we thought, of a little lake that dazzled our eyes with its brightness. We went on, surprised and silent, and soon got into the clean streets, formed by the neat garden mud-walls and the still neater fronts of the houses, and could scarcely believe that we were in Egypt. It was some time before our fancies were persuaded that we were in a Shellabe village on the banks of one of the winding branches of the Nile.

The name of the place was Mahatta. It was inhabited, we learned, entirely by that peculiar race of people called Shellabes, from Shellal, the Arabic name by which the Cataracts are known. They are evidently of Berber or Nubian descent, but intermingle very little with the parent stock, and seem to me superior in personal appearance and intelligence. They depend entirely for their living on work connected with the Cataracts—as tracking up or taking down boats, transporting merchandise, &c.—and seem to make a good thing of it. I admired their taste in selecting this lonely spot as the site of their village, although there are but a few basketful of earth in the neighbourhood. There never was a more romantic situation. Opposite rises a lofty desolate island; behind is a lofty desolate ridge. North and south barren rocks close in the view. The current of the river is scarcely perceptible to the eye, unless you stoop over the slippery rocks which lead down from the village; but it sparkles so gaily in the sun as to supply the place of almost all the other elements of beauty in a landscape.

In passing through the village, we saw only a few women, some of elegant form and agreeable features, standing in the streets; but when we had sat down on a great rock overlooking the stream, a crowd of little chattering children came round us, all offering something for sale. The parents were wise enough to know that these pretty urchins would make better bargains than themselves. One had a couple of spears with long blades and light handles, covered with the skin of the warran, or great water-lizard; others had sticks of hardwood fancifully ornamented with leather and brass wire. They sat around, talking with us in a very independent manner—at least such as could speak a little Arabic—the others chirping among themselves like birds, I believe in a dialect of the Berberi. Mighty curiosity, to the forgetfulness of all ideas of gain, was excited by the sight of a watch; and when they were permitted to listen to the ticking, there was actually a moment of awestricken silence. But they soon returned to the charge, urging us to buy their curiosities,

not at all in an importunate tone, but in a half-manly half-childish way inexpressibly amusing. Of course we felt bound to comply, and went away at last with many kind wishes for our safety. Even in the villages where the children have been taught, as in some parts of Egypt, to assail the travellers for *backshish*, they bless you before you give, and indeed whether you give or not. A little fellow came up to me, holding out his hand. 'If it please God, mayst thou go on thy way in peace!' 'If it please God!' said I, pretending to misunderstand him. He ran along by my stirrup with the same gesture and the same indirect form of asking. 'Why should I give thee anything?' inquired I. He smiled at the absurdity of the question, and repeated: 'If it please God, mayst thou go in peace!' I was deaf to his demand. He became more earnest, still sticking to the same form. My donkey began to go. He thought that as I had spoken I must relent, and followed. Finding me, however, obdurate to the last, he dropped behind, still murmuring, though with a disappointed tone: 'If it please God, mayst thou go on thy way in peace!' Next time I passed he kept aloof and remained silent, looking, however, benevolently at me. I called and gave him something, and was rewarded by his stereotyped good wishes for a prosperous journey in a very energetic tone. As he never went beyond these words, perhaps he knew no more of Arabic; but this polite and winning way of begging is general.

The donkeys used by travellers at Essouan generally belong to the respectable people of the town, who let them out incidentally when they do not happen to want them. You seldom get the same two days following, but you get the same boy and the same saddle. Some of the boys are intelligent, but others are sadly stupid. There is a man who affects to be a guide, and entertains travellers who employ him with long speeches about his honesty and tenderness of conscience. Going through a field of clover one day, he interrupted a very flowery speech on this subject, by saying to the donkey-boy: 'See, first, if nobody is looking, and then gather an armful of that *bursecum*.'

'Ho! ho!' quoth his employer, 'is this your honesty?'

The man was taken aback for a moment, but recovering, said: 'The owner of that field is my particular friend; and if I were to ask him for the whole crop, he would give it me.'

At Mahatta, as I have hinted, there is nothing to tell of the neighbourhood of the Cataracts. I do not remember that, even as the hush of noon came on, the roar of struggling waters reached our ear. It was some time subsequently that I went to view them from the shore. The road from Essouan was the same as that before described, only we had to push further on; and on turning off again to the right, found ourselves in still more rugged defiles. We were obliged to dismount, and scramble up on foot. Evening was drawing nigh; we wished to see the sun set, and made great exertions to reach the summit in time; but when we came almost at a run to the crest of the ridge, and saw the horizon, that had retreated to a vast distance, nothing but waves of purple light remained to greet us. I defy the world to produce a grander spectacle; but my pen has not the cunning to describe it. Indeed, I could not get to understand the secret of its grandeur—of the wonderful impression it made upon the mind. Was it the very paucity of its elements—billows of black rock congealed, but here and there edged, it seemed, with golden foam—valleys of gloom, fading off on all sides, as it were, into stationary banks of smoke? Such was the huge setting of the picture. And what was the picture itself? A river—a mighty current of water coming out of one of the largest of these shadowy valleys, and then breaking up into a thousand torrents embracing a thousand islands, and meeting in a thou-

sand eddying pools, with a hum, a buzz, a roar, that grew louder as the night came on; so that as we dragged along the precipitous path, our voices, hushed at first into a whisper by admiration of what we beheld, rose imperceptibly into a shout.

I know not why in this lonely place, where nought but the Cataracts and the wind are to speak at all—I know not why, I say, as the winds sink and go away murmuring to other regions, this tumultuous chanting of the waters should increase in potency—why they should seem to grow more restless when nought but the owl, and the bat, and the robber-wolf is abroad, when all else is welcoming the approach of sleep. Scientific men, eavesdroppers of nature, will no doubt find out some explanation in the disposition of different strata of the atmosphere; but at that time I could not help thinking that we had come upon some great meeting of the water-sprites—some parliament of demons engaged in supernatural debate. The light was rapidly fading away over the untrodden desert, and whole troops of thin shadows were coming playing towards us. Islands began to quiver like rapids, and rapids seem to grow solid like islands. A sad and silent black boy who came to us, I know not how, hurried us along from bab to bab. We might almost have fancied ourselves guided by a familiar of the place, had he not taken care at length to tell us that he was unwilling to be benighted in that lonely place. He wanted to go home. And where was his home? Behind that great isolated rock at the village of Korore.

We scrambled over the slippery rocks, whilst the moon gradually substituted herself for the sun. To our surprise, as we came upon a little bay above one of the babs or gates, we heard a voice, with a peculiar twang, singing out a queer couplet, the first line of which, I think, was—'Hail, Columbia, happy land!' An American, in trying to get too near this 'turnation tempest in a teapot,' had slipped into the water, and presently we actually made out the stripes and stars over a little boat snugly moored along the bank. A few minutes afterwards we heard the barking of dogs, got into a grove of trees, then into the dreathin village of Korore, parted with our sable little guide, and went away under a magnificent moon in search of the valley-road back. The lads who were with us talked of hyænas and jackals, and sang with somewhat exaggerated boldness to scare them away; but we heard not a sound, not a rustle, and saw nothing but rocks and moonlight as we jogged quietly back to our boat.

DR JOHNSON AND MISS HANNAH MORE.

AN IMAGINARY DIALOGUE.*

Hannah More. I have scarcely seen you, sir, since the death of poor Mr Garrick. His loss makes London quite another place to me. I shall return to Bristol with a feeling of dejection hitherto unknown.

Johnson. Poor David! It is forty years and more since he and his brother George called me Master at Edial; and upwards of thirty since I wrote the Prologue with which he opened Drury Lane Theatre. The actor, madam, like the rest of us, does but

'Strut and feel his hour upon the stage,
And then is seen no more.'

H. M. He did much, sir, to elevate the profession of which he so distinguished an ornament.

J. Both off and on the stage. He shewed the world that it is possible for an actor to embody grand conceptions in a grander form than that world has much idea of; and also to live respectably in society, and to fulfil decorously all the private duties of life.

* The matter of this dialogue is chiefly derived from the recorded sentiments of both the interlocutors.

H. M. Did you not consider his declamation very fine?

J. Why, madam, Garrick was no declaimer at all. Properly speaking, he never declaimed.

H. M. I might have expected you to oppose me, sir; for it is said that you have always considered Mr Garrick your property, and will permit no one either to praise or to blame him in your presence.

J. Mighty well, madam! silly reports are often spread by silly people; but I am vexed to hear them repeated by wise ones. If people praise Garrick injudiciously, as they very commonly do, I don't know any law, civil or social, that requires me to acquiesce; and if I did, I should break that law, as being itself fundamentally unlawful. If they censure Garrick without a cause, or without a just discernment of the particular and pardonable foibles by which he was beset, I think it right to retort upon their ignorance. And so little is there of careful reflection on the part of those who criticise him, that I daresay I find more occasions of opposition than of agreement; and this, madam, may have given rise to the foolish, tattling observation you have repeated. It may be partially true, as I have just explained; but, taken generally, it is false, and certainly ill-natured. Garrick, I reiterate, was no declaimer, great actor though he was.

H. M. But is not good declamation a necessary quality in a great actor? Or what, in short, was Mr Garrick, if not a good declaimer?

J. The fellow that acted Rosencrantz to David's Hamlet, or 'first murderer' to his Macbeth, could have declaimed better than he. But what of that, madam? I never saw David's equal on the stage. His excellence was seen in a correct idea of the part he assumed, and in the natural manner in which he represented it.

H. M. Then do you think, sir, that declamation is out of place on the stage? It seems to my poor judgment that there, if anywhere, the art should be pursued as a study.

J. I only said that Garrick was no declaimer, which has very little to do with your question. Perhaps he neglected the art more than became him; but he wished, madam, to disengage the public of their love for the declamatory, which had been for a long season (reposterously indulged. Little actors imitate great ones; and accordingly the successors of Betterton and Booth tried, one and all, to catch their rhetorical style, and of course exaggerated it in their own versions. Because the chief performer of his age had excelled in impressive declamation, all the performers of subsequent eras must needs declaim too, or expect to be sneered at as inferior actors. Now, Garrick was impatient of this nonsense, and boldly struck out into the opposite course. His genius carried the town by storm; for all could see that, however wrong Garrick might be if judged by tradition, he was orthodox itself as interpreted by nature. You know the lines of that dog Churchill—

'Figure, I own, at first may give offence,
And harshly strike the eye's too curious sense;
But when perfections of the mind break forth,
Humour's chaste sallies, judgment's solid worth;
When the pure, genuine flame, by nature taught,

(a very bad line, madam, and only not worse than the next)

Springs into sense, and every action's thought;
Before such merit all objections fly;
Pritchard's genteel, and Garrick's six feet high.'

H. M. Was Mrs Pritchard, then, the reverse of genteel off the stage?

J. Pritchard, madam, in common life, was a vulgar fellow; which gives force to what the 'Roscius' says of her. She would speak of her gown as her *gown*; but when upon the boards, all trace of this coarseness left

her; her recitations and gestures were all pervaded by judgment and elegance, or at least gentility.

H. M. If she disguised her vulgarity as completely as Mr Garrick made you forget his low stature, she must have been a great actor indeed. How sad to think that the time has come which applies to our late friend in earnest that epitaph which Dr Goldsmith anticipated for him in jest!

J. You allude to the verses in 'Retaliation'—

'Here lies David Garrick, describe him who can,
An abridgment of all that was pleasant in man;

and so forth. It is a very suitable epitaph in many points, though not all. Garrick was, without doubt, a very good man. In society he was vastly to be admired, notwithstanding his vanity, which, after all, was very natural in a man of his position. A guest of Mrs Thrale's once attacked David in my hearing on the score of vanity. I told the gentleman, that for Garrick to be vain was the last thing that should excite wonder; and that the only wonder in the case was, that after so many bellows had blown the fire, he was not reduced to a cinder. The wonder is, how little Garrick assumed. Applause was his hourly pabulum; from a thousand voices it rang in his ears every night, as the 'well-graced actor left the stage.'

H. M. I protest it does vex me to hear persons who knew nothing about him cavil at him as an avaricious man. I, who have known him so intimately, have known few, very few, who come near him in liberality.

J. Right, child; perfectly right! There might be a little vanity in David's way of disbursing his money; but he proved that money was not his Great First Cause. I often repeat that he has given away more money than any man in England—in spite of Foote's malicious sarcasm.

H. M. What was that, sir?

J. Foote used to say that Garrick walked out with an intention to do a generous action; but that in turning the corner of the street, he met the ghost of a half-penny, which frightened him back again.

H. M. He was careful of expense at home in some respects; but never sufficiently so to justify such a libel as that. My own experience remembers nothing in that dear man but what was kind and generous.

J. And remember, my dear, that the money which David gave away so largely was not his by inheritance or gift. Every shilling of it he had laboured for; and in dispensing it, he dispensed the fruit of toil and trouble. He was, I grant ye, a grasping lad when he started in life. His father was a poor man—a half-pay officer—and the family had to study how to make fourpence do as much as fourpence-halfpenny did for their neighbours. But when David had once made a purse, he kept the strings very loose, and was continually dipping his fingers in it, transmuting the gold into charity.

H. M. Do you think, sir, Dr Goldsmith had any right to say that

'He cast off his friends, as a huntsman his pack,
For he knew when he pleased he could whistle them
back!'

I, at least, never perceived any fluctuations in his friendship. Its tide was ever flowing, never ebbing.

J. Why, madam, an old Greek once said, 'He that has friends has no friend'; upon the import of which maxim I recorded, years ago, a few thoughts in an essay in the 'Adventurer.' Jack Wilkes told Boswell that Garrick was a man who had no friends; and the remark had more truth in it than Wilkes usually uttered. Garrick had the elements that compose friendship, and that in a signal degree; but they were allowed to cover too large a surface, and so ran to waste. He was every man's friend, but not this man's, or that. He had no bosom companion—no cherished intimate; and, in the absence of these,

friendship itself, in its proper meaning, is absent also. You must know, madam, that Goldsmith and Garrick crossed each other's path many years since, and though they became pleasant companions, perhaps neither of them forgot first impressions—the tingle of which still irritated poor Goldy's thin skin when he sat down to write 'Retaliation.'

H. M. I suppose some literary squabble occasioned the original coolness?

J. Why, yes, madam; something of the kind. Garrick was lord of the stage, and was thought to exercise his lordship after a very tyrannical fashion. Goldsmith wrote an 'Inquiry into the State of Polite Learning,' wherein he expressed himself severely, and, as David considered, with rude personality, against theatrical despots. When Goldsmith sometime afterwards called on the great manager, and begged his interest in some official or professional capacity, he was roundly rebuked for making so free with one whom he had presumed to castigate without cause. Goldy denied that he had ever intended anything personal; but his suit was unsuccessful, and he set down our modern Thespis as an arrant foe. But then Goldy's temper was highly placable; and when we proposed to increase the number of members in the Literary Club, he zealously supported the election of Garrick, to which even I was at one time peremptorily opposed.

H. M. Opposed to the admission of such a man as Mr Garrick to the club?

J. Yes, madam; and not without reason. I was anxious to keep the club select, and, as you might say, exclusive. Such a man as Garrick would introduce a new feature in its character, and one that might injure, I feared, its legitimate design. For he was a rattle-brained fellow in conversation; full of light gossip; jumping from topic to topic.

H. M. I have at least good authority, sir, for calling him

'As a wit, if not first, in the very first line.'

J. I call him gay and grotesque in conversation. His talk was clever, but frothy, and had no solid foundation. It wanted depth and sentiment. Accordingly, when Hawkins proposed Garrick's admission, I said, 'No, he will disturb us by his buffoonery.'

H. M. That was a severe word, sir.

J. Why, David had vexed me at the time by his vanity in making *sure* of admission. He told Reynolds that he liked our club, and thought he would join it—as though the club had no voice and will of its own. 'He'll be of us?' said I to Reynolds. 'How does he know we will permit him? The first duke in England has no right to hold such language.' Poor Davy was mightily annoyed by his exclusion. But we relented at last, and many happy evenings have been made the happier by his presence. He was the cheerfulest man I ever knew.

H. M. Did you prefer him, sir, in tragedy or comedy?

J. In comedy. But he was a master in both. 'Take him for all in all, we ne'er shall look upon his like again.'

H. M. I am glad to hear you speak so of dear Mr Garrick. I am sure, sir, he loved you very sincerely.

J. And I loved David with all my heart, and have felt his loss greatly. It is no light matter to lose a friend of forty years' standing and more. I have often been affected by a passage in one of Swift's letters to Pope—'I intend to come over, that we may meet once more; and when we must part, it is what happens to all human beings.' Death has sadly thinned the ranks of my acquaintance; and the older we grow, the faster they drop off, just when we can least spare them.

H. M. We can look forward with joyful hope to a reunion with our old friends in a better world, if our friendship has been worthy of the name.

J. Why, yes, madam, if we have formed virtuous and serious friendships, such anticipation is very consolatory. But many friendships are formed for merely gay and irreligious purposes, in a foolish and worldly spirit, and we cannot expect them to be renewed beyond the grave. Sometimes we seek intimacy with a man through a misconception of his character; here, again, future friendship is not to be expected, even though the intimacy continued to the very edge of the tomb; for after death we shall see face to face, and know as we are known.

H. M. But you have no doubt, sir, that the better sort of friendships will be perpetuated in a future life?

J. Either we shall be satisfied with a renewed intercourse with old friends, or we shall be satisfied without it.

H. M. I can hardly understand the latter clause, sir.

J. Nor I, madam; but I can believe it.

H. M. How fondly my heart assented to the hope, at Mr Garrick's funeral-service, that the soul of our dear brother now departed was in peace!

J. You were present in the abbey, were you not?

H. M. Yes, sir; the bishop of Rochester was civil enough to send tickets for Miss Cadogan and myself; and we were accommodated in a little gallery directly over the grave, where we could hear and see everything with painful distinctness. My heart sank within me as the great doors burst open, and the choir advanced to the grave, all in white surplices, and chanting Handel's solemn anthem. The very players, practised as they were in fiction, shed genuine tears for once.

J. Mrs Garrick seems to bear up bravely.

H. M. Yet she has that within which passes show. She checks with rare energy every outward symptom of anguish. I told her last week that her self-command amazed me; and her reply was, that groans and complaints are very well for those who are to mourn for a little while, but a sorrow, said she, that is to last for life will not be violent and romantic.

J. Poor thing! poor thing! It is a sore trouble, and grievous to be borne. We must pray for her, my dear child, that a yoke so galling may be made easy, and a burden so heavy be made light.

OCCASIONAL NOTES.

AUSTRALIA.

By a letter received from a correspondent in New South Wales, it appears that a great impetus has been given to the prosperity of that colony by the mining of coal and its export to California. Coal seams of great thickness are found on the Hunter River, and there mining has been commenced on a large scale. The following is our correspondent's account, dated October 1850:—

'A new trade has sprung up in this river (the Hunter) within the last few months, in the great demand for coal by ships from California. As many as eighteen or twenty sail of from 400 to 800 tons each are now waiting to be loaded at Newcastle (such being the name given to the harbour at the mouth of the river), and a number have sailed within these three or four days. Many others are daily expected to arrive. Besides all this, the export of coal to neighbouring colonies by means of small vessels is exceedingly brisk.

'You can form no proper idea of the vastness of our coal fields. The whole basin of the Hunter is one coal field, extending from the sea at Newcastle to the dividing range of mountains a hundred miles inland. At the present moment there are about twelve mines at work. The coal is generally procured with very little trouble, near and at the surface. A joint-stock coal company have, in consequence of this increased demand, lately extended their operations.

They have just completed a railway of two miles from the harbour to a pit where the working of a seam of superior coal, eleven feet thick, is begun. This seam lies at the depth of only from twenty to twenty-five fathoms from the surface. A powerful steam-engine draws up the coal. The same company have two other pits and engines at work.

'Another coal field has lately been carefully examined, about forty miles to the north of this, and about twenty miles inland from the navigable harbour of Port Stephen. I am informed by a gentleman who visited it, that there is one seam of solid coal cropping out, thirty-four feet thick, and of very superior quality. What an immense amount of dormant wealth in this mass of fuel! Yet all our prodigious resources, mineral and agricultural, are of comparatively little avail, in consequence of a want of labour. We want an almost unlimited accession to our population by continued immigration.

'Nothing has lately been heard of Dr Leichhardt and his party, who went off on the perilous expedition of exploring the interior, across from New South Wales to Swan River. Fears are entertained that this enterprising traveller has fallen a sacrifice to the savages of the central unexplored region. Here, in an old-settled part of the country, we know little of the hardships encountered by explorers. There is one class of men to whom justice has never been done. I allude to the assistant-surveyors employed by government to explore and bring home correct accounts of unknown regions, for it is those occupying the position of assistants in the survey department on whom the hard work principally falls. I lately became acquainted with an assistant-surveyor, and gathered from him many curious details respecting his operations. His story may amuse your readers.

'James Burnett, who was born in Edinburgh, emigrated with his father (a son of the late Mr Burnett of Bams, in Peeblesshire) in 1829 to New South Wales, where he received an appointment in the surveyor-general's office, under the auspices of Sir Thomas Livingston Mitchell. In 1836 Mr Burnett was appointed an assistant-surveyor, and has ever since been employed in various parts of the colony. An assistant-surveyor leads the life of a pioneer amidst deserts, forests, and swamps; crosses rivers, scales mountains, and makes his bivouac in the neighbourhood of savages, snakes, and swarms of mischief-loving insects. Young Burnett had his fair share of these experiences in the bush. For some years he was stationed in Illawarra, and was there much employed in surveying tracts of low swampy land. For whole days his lower extremities were constantly wet, with a fierce sun scorching overhead. On one occasion, when engaged in surveying on the Richmond River, he found it necessary to proceed on a journey when the whole country was flooded. He rode one horse and led another, swimming them at every crock, and as there were no houses or huts by the way, he had to sleep every night in his wet clothes in the open air. His encampment was finally reached without accident.

'About the end of 1846, when in charge of the Moreton Bay district, and suffering from the effect of previous exposure, this active young man was despatched to accompany Captain Perry in his exploration of a river called the Boyne, from its head-waters down to the point where it became navigable. The party, disabled by bad weather, was compelled to retrace its steps, and Burnett was some time afterwards employed to complete the survey himself. This undertaking he effected by incalculable toil, amidst thick scrubs and swamps. Some important parts of the river towards its mouth remained yet to be examined, and he solicited permission to go on a new expedition along the coast by water. This being granted, he left Moreton Bay on the 5th of July 1847. Everybody

considered this a hazardous enterprise. Burnett, with seven attendants, arms, and provisions, set out in an open whale-boat, to perform a voyage of 240 miles of ocean on a dangerous coast. The party was successful. It reached the mouth of the Boyne, and proceeded up the river considerably beyond the point formerly reached by land. On his way back, Mr Burnett made a survey of a fine river which he discovered disembodying into Wide Bay, which the governor afterwards named the Mary. The country adjacent to the Boyne has since this period been settled: it is called the Burnett District, in compliment to its first explorer. Although still a young man, Burnett is much shattered in constitution by the privations to which his duties have exposed him. One day lately, on calling on him, I found him prostrated by rheumatism; but he was as cheerful as ever, and expected soon to be busy with fresh engagements. It is by such men that England opens up new fields for her emigrants. What should we do without a dauntless corps of surveyors?—and of this useful class of persons Scotland contributes her share. Should Leichhardt, the great explorer, cast up, the surveyor-general will doubtless be let loose on his track; and we may hope that at least a portion of the blank which disfigures the map of Australia may be filled up with names, and made geographically known.'

ECONOMIC VALUE OF PEAT.

Dr Anderson, professor of chemistry to the Highland Society, has published a report of certain investigations which he instituted for the purpose of ascertaining if peat was capable of being turned to profitable account, either in the form of charcoal or by its conversion by distillation into products of commercial value. The result, we regret to say, is discouraging. The learned professor finds the selling price of peat-charcoal to be L.1, 15s. per ton. The expenses of the production in Ireland would be L.1, 3s. for the draining of the bog, and the cutting, packing, carrying, and burning of the peat. When rent for the bog is allowed for, it appears that a small profit may be looked for while the present price is sustained. In Scotland, Dr Anderson calculates that the process would cost, at the lowest estimate, L.1, 10s. 6d., but more probably L.1, 13s. 3d. It evidently, therefore, could scarcely become a profitable manufacture in Scotland. Dr Anderson gives another blow to the hopes of certain speculators, by shewing that peat-charcoal, by itself, is not a manure, and that its theoretical utility as an absorbent of ammonia, so as to become a manure, has been vastly overstated. The experiment grounded upon was performed under peculiar circumstances, which could not be generally followed economically. In ordinary circumstances, it has very little power of absorbing ammonia; and even when it extinguishes odours, that result is not found to have taken place to any important extent. The professor says: 'The absence of absorptive power in peat-charcoal led me to inquire whether or not peat itself possesses this property in any greater degree—a matter which it is of some importance to determine, as that substance is so commonly added to the manure heap as an absorbent. The experiments were made on an excellent peat from Dargavel, Renfrewshire, where it occurs in considerable depth. That which I employed was taken from the surface, and from depths respectively of 2½, 3½, and 4½ feet. The result shewed that no less than from 1½ to 2 per cent. of ammonia were absorbed; and the experiments were sufficiently varied to demonstrate that it is not only capable of absorbing, but of retaining a large quantity of ammonia, under what may be considered very unfavourable circumstances.'

'Although this per-centage may appear small, it must be recollected that it is more than three times as much as is contained in farmyard manure of ordinary quality,

and that the addition of even a small proportion of peat to the manure-heaps would be likely to retain, in a completely satisfactory manner, any ammonia which existed there in a volatile condition.

'I need scarcely say, however, that we must be prepared to find that all samples of peat will not be equally efficient as absorbents: the peat which is most porous will absorb more ammonia than that which is dense. As it is customary to employ clay or dry earth as an absorbent of the waste matters of the manure-heap, it is well to contrast their value for that purpose with that of peat. A specimen of a wheat-soil was experimented upon, but was found to have absorbed in 2000 grains of soil only 0.17 grains of ammonia.'

With regard to the plan of distillation, the learned professor alludes to the proceedings of a company by whom the process is carried on. In the calculation issued by the company, 'the expenditure for the peat, wages, wear and tear of apparatus, &c. is estimated at L.11,717; whilst the produce, consisting of sulphate of ammonia, acetate of lime, naphtha, paraffine, volatile and fixed oil, is estimated at L.23,625.

'It must be distinctly understood, however, that this estimate is not the result of the actual manufacture, but of an experiment made upon two tons of peat; and the result on the large scale might, and would probably yield very different results. Little satisfactory information can, in fact, be drawn from an experiment of this sort; because of course it has been made with care, and by men of intelligence, who have attended to every step of the process, while matters are very different when in the actual work we come to depend upon common workmen. The apparatus used is no doubt very ingenious; but, as far as I can understand it, appears to leave the process very much at the mercy of the workmen, whose carelessness would greatly diminish the amount of products obtained.

'As far as the value of the product obtained goes, the company appear to have in many cases overrated them. Should any of these products prove unsaleable, of course the 100 per cent. profit which the estimates shew will be greatly reduced. It would be further diminished by increasing the expenditure, which appears to me to be greatly under-estimated. So far as I have been able to ascertain by inquiries of the expense of distilling wood, and of purifying the products of coal-tar, I am led to infer that the cost of peat-distillation, and the conversion of the products into a marketable condition, would be much greater than is estimated. The manufacture of sulphate of ammonia, for instance, is an expensive operation, and extremely destructive to the apparatus, so that for this alone a very large sum must be put down in the shape of wear and tear. The amount of labour required is also, as I think, much under-rated, and no allowance is made for the large capital which must be invested in apparatus and buildings for carrying on the operations.

'From a careful consideration of all the circumstances of the manufacture, I have come to the conclusion that it is quite impossible that the large profits alleged are ever likely to be realised, and I question much whether any remunerative return is at all likely to be obtained. On this, however, I am unwilling to express a definitive opinion; because I do not believe it possible to do so in the present state of our information, although the previous want of success of similar experiments seems to confirm it. Of thus much we may be certain, that even if it returns one-fourth part of the expected profit, in no long time the manufacture will be taken up in all parts of the country. There is, however, one matter of no little importance, which must be considered, and it is the absolute certainty, that with the greatly-increased production which would be occasioned by the extension of the manufacture, the prices of the products would be considerably reduced. The salts of ammonia, for which the demand is at present scarcely

equal to the supply, would soon fall in price, as well as several of the other products, to the inevitable extinction of such profits as are now obtained.

'I may sum up the results at which I have arrived by simply saying:—1st, That the value of peat-charcoal as a manure and absorbent of the valuable constituents of manures, is not such as to justify the farmer in employing it, or to encourage us in attempting its introduction into Scotland; 2d, That dry peat is a valuable absorbent of ammonia, and, as such, deserves the attention of the agriculturist to a greater extent even than it has yet done; 3d, That the profits of the distillation of peat appear to be greatly exaggerated, and although they cannot be definitely estimated as present, the failure of all previous attempts should teach us great caution in examining the experiments of theorists.'

LIFE'S EVANGELS.

SILENT upon the threshold of life's portal
Sits the veiled Isis of the FUTURE—all
That time has yet of bitterness and sorrow
Lies hid beneath that dark, unlifted pall.

Behind us sadly stands a mournful maiden
With an enchanted mirror in her hand;
Cypress and violets on her brow are blended,
With daisies ever fresh from childhood's land.

The shadowy PAST glides o'er the changeful mirror,
Like sunny tears and clouds o'er April skies,
Or lit by avenging lightnings that have smitten
The heart with agony that never dies!

Thus the accusing and the unknown haunt us—
The hidden wo and the remember'd pain;
But FAITH and DUTY in the orb'd Present
With angel pinions hide the phantoms twain.

SUTHERLAND.

NIGHTINGALES—A CAUTION TO PURCHASERS.

The principal dealers in these noble birds reside in the classic region of the Seven Dials, London; and as there is much trickery practised here, I will pave the way for plain-sailing. In order to make a great show of business, some of these dealers—one in particular—always collect together a number of nightingales' cages, at least ten days before the birds arrive amongst us! These are placed on high shelves, after being artfully papered up in front with tissue paper, so as to make people believe that each cage contains a nightingale. When folks express their surprise at the birds coming over so early, they are told 'the birds are very wild, and must not be looked at for at least ten days. At the end of that time they will be quite tame, and in full song.' This bait is generally swallowed by *parvenus*, who keep on calling till at last they do hear a nightingale sing! *Perhaps* there are two real birds among the whole of the papered-up cages! A little caution and a little common prudence after this intelligible hint, will put a novice on his guard, and enable him to appear a knowing one. He cannot speak too little; but he had need be all eye and all ear.—*William Kidd, in the Gardeners' Chronicle.*

PLANTS.

Plants vitiate the air of a room at night, not because they part with carbonic acid, and inhale oxygen—for a human being would vitiate it more in this way—but from their powerful odour, which has a most violent effect on the nervous system of some persons.

RIDICULE AS A WEAPON.

It is particularly necessary that a sound discretion should be exercised in the use of ridicule as a weapon. Its power of offence and defence is enormous. The stoutest and the most sacred cause can scarcely withstand it. Argument often sinks abashed before it. Often, where unable to accomplish the victory, it will at least take away all zeal and fervour from the other side, and thus gain its point by creating indifference. The basis of this power is the universal love of a jest, and the comparative rarity of clear judgment and sound principle. Hence let the most admirable things be brought forward and speculated upon, men will in general listen with reluctance; but let some wag throw in a jet of ridicule, the majority are instantly off in a fit of merriment, from which it is not easy to recall them to the subject in its proper aspect. One could almost suppose that men felt a jealousy regarding grave and important things, and were for that reason happy in an opportunity of turning out their ridiculous sides. Or perhaps it is only the contrast between the solemn and portentous aspect of these things, and their ludicrousness in the eye of levity, which renders them such favourite topics for mirth. However it is, certainly philosophies, pomps, formalities, dignities, have at all times been peculiarly liable to the travesties and burlesques of the profane. Now this very delicacy in the status of such things calls for a tenderness on the part of those who are prone to the use of ridicule.

It should be always kept in mind, that ridicule is not necessarily truth or justice. It may be employed, doubtless, on that side; and we have seen it so employed with vast effect in some remarkable instances. But certainly there is no necessary connection between ridicule and truth. Let us take, for instance, Peter Pindar's jocular poems on King George III. The descriptions given by the poet of the monarch's style of speaking, and even the reports of some of the particular expressions used by him, are probably not far from the reality; but will any man undertake to prove that the general effect of these pasquinades is to leave a just or correct view of the life and conversation of the king? It is at the best but a part of the truth, and that so set forth as to tell untruly. So also take Peter's really amusing poem descriptive of Sir Joseph Banks's hunt after the Emperor of Morocco butterfly. Grant this were true as an isolated fact, the effect of the narration is nevertheless false. The respectability of natural history as a study is sunk in the ludicrous circumstances attending one of the means necessary for prosecuting it. The self-devotedness of the great naturalist, which led him all over the world for the acquisition of

knowledge, is lost in the view we have of him flying over Cockney suburban gardens, and through mires and brakes, in chase of a humble insect. We may laugh; but the injustice of the whole picture towards both Sir Joseph and a science which, rightly studied, is a kind of religion, must be manifest to every reflecting mind.

There are few things which the light-headed part of the community seem to enjoy more than the detection of any mistake made by the votaries of the speculative sciences. The exquisite drollery of the situation of Jonathan Oldbuck on his Roman Camp, when Edie Ochiltree claimed to have been present at the making of it, has perhaps been relished more than any other single scene in the Waverley novels. So also Fielding has created one of his most effective pictures, by placing a certain philosopher in a situation violently exceptive to the tendency of his doctrines. We should, however, keep in mind, that such circumstances might happen in the actual world, and yet only be exceptions to general rules. Although one antiquary may have mistaken an old sheepfold for a station of Agricola's army, it does not in the least invalidate the facts that Agricola conducted the Roman arms through Britain, and that Roman camps are actually in existence in pretty nearly their original lineaments throughout the country. It would, therefore, be the greatest possible mistake if, on being asked to go to see Ardoch, which is perhaps the most entire of these structures in Britain, we were to decline from incredulity raised through the case of Oldbuck and his Kinprunes. We should in that case be allowing a jest to swamp, as far as we were concerned, a fact, and a very interesting and important one—namely, that there you may see to this day the walls and gateways within which the conquerors of the world rested seventeen hundred years ago, when attempting to complete the subjugation of the British people.

Not many months ago, a party of scientific students and amateurs were conducted to see some of those smoothed and polished rocks which are supposed to be the memorials of the passage of ice over our country in what geologists call the pleistocene era. Several veritable instances were shewn; but, unluckily, there came in the way a surface falsely supposed to belong to this class of phenomena, having a certain shade of resemblance to the true examples, but wanting all the essential characteristics—in fact, only a tolerably flat specimen of trap surfaces at what had been a joint or fracture in a mass of that kind of rock. While the party was examining this phenomenon, a person present very candidly mentioned that he had often observed boys sliding down this rock, seated; and he had no

doubt that its peculiar shining smoothness was partly at least owing to that cause. This of course produced a general merriment; and such was the effect of the new spirit thus engendered, that not without considerable difficulty could the guide of the party obtain any degree of candid attention, much less of faith, for the true examples which he afterwards shewed in situations where such a cause was not presumable, and where the characteristics were true and unmistakable. Now ridicule was clearly at issue with truth in this instance. With its usual fascination, it raised a prejudice regarding the phenomena which were in the course of being studied. Many to whom the alleged facts were a novelty felt their original scepticism confirmed. Others less ready to give up results so largely vouched for, were yet cooled down into a fear that many mistakes had been made. The result was, that an opportunity of acquiring some experimental knowledge of an exceedingly curious passage of the history of the globe was in some measure lost, the chance of obtaining fresh minds to the investigation was diminished, and those already engaged in it were discouraged. Contrast with this effect what might have been expected to take place if the cicerones of the party had been allowed quietly to point out the difference between the false and the true examples. He would have shewn that the similarity was only superficial and trivial, and that when a close and minute inspection was made, the former exhibited certain undulations not traceable on the latter; that it shewed none of the furrowings in one direction seen there; and that there were abruptnesses rising near it which were totally irreconcilable with the idea of ice in any form having swept across it. Above all, he would have shewn that though a true example had chanced to be brightened up a little by the sliding of boys, there were numberless others perfectly identical which no boys could have used in that manner; so that the modern accident went for nothing. Here would have been a philosophical lesson on evidence, and an opportunity of impressing the great lesson that the detection of differences, not of resemblances, is the first business of science; and the party would have gone home rationally improved and edified—instead of which there was only a rapid laugh, and a forenoon spent to comparatively little purpose. It is perhaps expecting too much of the angelic from men to suppose that they will resist a laugh at philosophers when it comes in their way; yet it may be well at least to point out that the laugh proves nothing, and perhaps prevents something from being proved.

Ridicule, on the other hand, has undoubtedly its legitimate uses, and we often see it do, in a short-hand manner, services which reason might fail with its utmost efforts to perform. How effective, for instance, was Don Quixote in correcting the taste for romance-reading in Spain! For the repression of Puritanic fanaticism Butler did more than king, lords, and commons could have effected. Sometimes a merry ballad will help on a revolution, and sometimes preserve a throne. The follies, and even the vices of individuals may be attacked by it with equally powerful effect. True; but there is a prerequisite—be sure of the justice of the cause in which ridicule is used. No matter for this, some one may say; a good cause and an estimable man will stand against ridicule, and not be the worse for it. With deference, I doubt this; at least I every day see good causes kept in check, and good men prevented from breaking through social slaveries,

by the dread of ridicule. It is not a well-directed laugh only that is effective, for a jest well put, whatever be its moral merits, will always carry the multitude along with it. I deprecate the subjecting of even the best of causes to such a test. The effect may not be everlasting, but it is certain to be powerful for the time. Therefore, though I might be above courting the alliance of ridicule, I should always rejoice to see it fighting on my side.

It is, on the other hand, beyond question that even ridicule is the better of being on the right side. Give it reason as its basis, and a really noble end in its view, and see how transcendently successful are its blows compared with what they are under the direction of folly and emptiness. The perfection of this branch of rhetoric would undoubtedly be in its use for the advocacy of some lofty cause having large benefits to mankind in contemplation, and against which hosts of petty interests were arrayed. Let it lash only meanness and selfishness; let it pillory none but dishonest thinkers; let it strive to clear away from the path of the philosopher the triflers who delight to set briars in his path, instead of raising merriment at the expense of the philosopher himself, and we should see Ridicule take a place in literature and oratory which it has as yet scarcely pretended to.

THE CITY OF THE DECEIVED.

WHEN the ancient city of Nuremberg, in times which were reckoned old by our fathers, stood high among German towns for manufactures, merchants, and meister-singers, the most notable and not the least prosperous of its burghers was Fritz Fusseldorf. Fritz was regarded as chief among the wise and prudent of his native city. There were richer men in Nuremberg, but few who had navigated the waters on which their lots were cast so safely, or kept the full freight of fortune, friends, and character, in such good condition as he, up to what in life's geography looms out as the headland of fifty.

In the course of that half century Fritz had seen some changes, and heard much noise in the world around him, though his feet had never been a league beyond the walls of Nuremberg. The Augsburg Confession, the Council of Trent, the Thirty Years' War, and the Freewill Controversy, had each in turn disturbed the workshops and warehouses of that old trading city. There had been displacements in its convent cells and in its senate-hall; great houses had sunk, and small ones risen, through the change of creeds and masters, but that of Fusseldorf still stood firm, by a neutrality most difficult to practise in those times, in right of which its master had won his unrivalled reputation for prudence. Fritz sought for no office, and laboured after no distinction: every established power found him a quiet subject, and every fallen one a friendly passer-by. Indeed passing by on the other side had been the policy of his life when there was danger or trouble to be expected; but nobody charged him with party zeal, personal ambition, or unfaithfulness to any cause. Nature had done much for Fritz Fusseldorf in keeping him to this wisdom, for he was of a temper cold, calm, and calculating: but fortune had done something too, in making him the only son of a gaining and careful merchant, with three daughters, all married and portioned off in the lifetime of their father, who died leaving Fritz well advanced in man's estate and in mercantile

practice, with the fair mansion he had built hard by the church of St Sebald, a fairer business in the Venetian trade, and the hopeful condition of a bachelor.

Fritz had kept these privileges and possessions yet entire, in spite of many a bold conspiracy against his peaceful solitude among his fair neighbours (for such practices existed even in the Reformation times), and many an eager hope among the increasing families of his numerous relations, as they read in fancy his last will and testament. There were those in Nuremberg who sincerely believed that his own judicious steering between these hostile interests was one prevailing cause of the number and steadfastness of Fusseldorf's friends; as from Legilend, the maiden sister of his neighbour the goldsmith, and the most renowned needle-worker within the ramparts, who had declared her intention of embellishing a noble piece of tapestry then in progress with his picture, to his eldest brother-in-law, who found consolation under the infirmities of seventy years by investing Christmas gifts in his legacy, Fritz was universally sought after and commended. Thus keeping aloof from the anares of his time and the cares of life, Fritz had applied himself steadily to business from his youth, taking little relaxation, except in observing the mistakes and follies of less prudent burghers, on which no man could make wiser remarks, and in the easy outskirts of letters as they were then known to Germany.

The city of Nuremberg was accounted learned in those days: besides the corps of artisan poets known as *meister-singers*, it was rich in doctors of law and divinity, and had a press yet famous with the collectors of old books for the quaint and curious folios it printed. Under favour of these opportunities the burghers cultivated taste in the fashion of their day, and became notable critics in poetry and sermons. Some also dipped into philosophy; others read accounts of voyages and travels; but by far the most generally accomplished was Fritz Fusseldorf. He had gone a little way into all the learning of his age, and his library already consisted of almost fifty volumes on every current subject, from the alchemy of Albertus to the moralities of Hans Sachs. Fritz used and exhibited that treasury of knowledge prudently, as became one who knew not what might be looked upon as heresy: but as his mercantile wealth and bachelor years increased, the fame of his acquirements grew also, till poets began to solicit his patronage, and poor doctors dedicated their works to the enlightened merchant. These honours Fritz at least thought merited, but he sustained them with his accustomed steadiness. The poets were patronised to the extent of giving himself little trouble and less cost, and the dedications received with some ready and well-turned compliments. Time and fortune had well rewarded his attention to their lessons—placing him in strong contrast to many an early acquaintance. He had remarked on the ruinous vanity of one and the needless parsimony of another; on a third's imprudent match and a fourth's ill-reared family; and thanked his good sense that he was like none of these. Yet the wise and wealthy merchant was not without aims in existence beyond the increase of his profits and the enlargement of his warehouses.

Fritz had an ambition of his own, though it was of the silent and provident sort. The vein from that point commenced with retiring from business, extended through far travels in the observation of men and manners, and closed with the authorship of a volume containing such sage remarks and maxims, as would make him the wonder of his own age, and the master of moralists to all times. After that achievement, Fritz had not quite determined on his line of march to the grave—whether it was to be enlivened by the presence of Gertrude, the goldsmith's daughter, who had learned obedience under her distinguished aunt, and whose youthful mind might be conveniently formed by his

precepts, or to be magnified by the foundation of a college in Nuremberg, to be called by his name, and for ever subject to the reigning orthodoxy.

By way of beginning these mighty schemes, Fritz took an early occasion to inform his friends, and through them the city, of his retiring intentions; sold out his stock in trade to one of the wealthiest and least-hated Jews in Nuremberg; vested his capital in the city bank, then believed to be as strong as its imperial castle; and commenced poring over maps, in preparation for his travels.

He had been occupied all day in tracing his route from Nuremberg to the Emperor Charles's Spanish capital, though flowers had been strewn, and shepherds had danced in the streets, for it was Whitsuntide. The Franconian corn stood high and green, and the lindentrees were in full leaf round the old city's ramparts, as Fritz walked in their shade, still pondering on the distance and dangers of the journey. That was his accustomed walk down by the river just an hour before the shutting of the gates. The sun was setting, and he could hear the hum of the town grow faint behind him, while the cow-bells and the swineherds' horns sounded from neighbouring hamlets: but his path was unusually deserted; not a wayfarer could be seen along the banks of that smooth river except one man, who sat as if to rest on the broken wall of a long-ruined hermitage. His garments were in the fashion worn by the humblest artisans; his face was calm and thoughtful; but Fusseldorf's expectation of the customary reverence to his rank was disappointed by the stranger fixing his keen gray eye upon him as he said: 'Good-evening, brother. How call you yonder town that stands so fair in the sunset?'

'It is the ancient and famous city of Nuremberg,' replied Fritz with a true burgher's pride; 'renowned throughout Christendom for arts and letters. Whence come you, stranger, to be so near, and know it not?'

'I come from a still greater town,' replied the stranger. 'You are doubtless acquainted with Falsenberg—famous throughout the world for the tricks and cheats with which its inhabitants impose upon themselves.'

'I never'—heard of such a town, the merchant would have said; but he recollected half way that so full a confession of ignorance did not become his learned reputation, and therefore added—'met with any traveller from that city.'

'That is marvellous,' said the stranger, 'considering that so many come this way, which is indeed the most direct. I myself left Falsenberg in the morning, and am about to return thither.'

The soul of Fritz Fusseldorf was astonished. In all the books of travels he had read, from Marco Polo to Columbus; in all the maps and charts he had so lately explored, there was no mention of Falsenberg. The first impulse of his surprise prompted him to declare his utter ignorance, and request immediate information from the stranger; but his wonted prudence suggested that the particulars might be reached without that exposure.

'I had not suspected that your city was so near; but truly there is little mention of it in either map or volume,' said he, familiarly seating himself beside the blunt, honest-looking traveller, who smiled as he answered: 'The name of our Falsenberg is unknown to these geographers. They study but the upper side of the world, and it lies on the other; yet trust me the way is direct, and not a day's journey from this ruined hermitage.'

'Friend,' said Fritz, much relieved on the score of his own learning, but growing more impatiently curious at every word—'you may not know that I am a free burgher, and sometime a merchant of note in yonder town. My fortune is ample, for I inherited a large business and fair possessions from my father, the profits

of which I have increased by a prudent and industrious life, carefully avoiding the vanities and follies into which I saw many of my neighbours fall, and giving up my leisure to the study of letters and general wisdom; till now, in the prime of my days, I have retired from trade, resolving to spend some time in travel and inquiry after the ways and wonders of the world, that I may leave the results of my knowledge and experience to posterity.'

'It is a noble design,' said the stranger, 'and well becoming a citizen of large fortune and liberal mind in this enlightened age. Poor artisans like myself cannot aspire to such great things; but as you may not know that I am a cobbler and a poet, with a stall and sundry printed ballads in the fair city of Falsenberg, I will mention that my father left me nothing but three little sisters to maintain, which I have done, and got them all well married; that I have cobbled shoes since my thirteenth year, besides composing a few songs and plays which are known to mountebanks and the frequenters of taverns; and that, with God's blessing, I expect to compose and cobble till the end of my days.'

'Friend,' said the merchant, 'I rejoice in your art, and have patronised many poets. The meister-singers of Nuremberg are doubtless known to you; but tell me something of your great town, for I am curious on such matters.'

'It has,' said the stranger, 'ramparts, trade, and churches, a senate-house, a citadel, and a place of execution, like most other towns. Armies have leaguered its walls, kings have feasted in its castle. Scholars have been born, and books published there; the sun shines upon it, and the rains descend; yet whether the cause be in the air, the water, or a spell which some ancient sorcerer laid upon its site, our divines and doctors cannot agree, but all the inhabitants live in the practice of deceptions upon themselves, and believe, beyond persuasion, in the most palpable falsehoods.'

'It is strange,' said Fritz. 'But, friend, how are they generally deceived? Is it in matters ecclesiastical or civil?'

'Every way,' said the traveller. 'Man and woman, noble and artisan, each prepares cheats of his own. But two things are remarkable concerning them all: first, that every man clearly understands his neighbour's mistake, and will reason freely upon it; and, secondly, that he will never forgive any one who attempts to even suspect his own. It is also observable that this madness augments with their years. In childhood, the greater part believe only untruths which they are told, but in early youth they begin to trust in fair-speaking fancies; and ever after, through all the disproofs of time and the teachings of experience, their faith grows stronger in one falsehood or other, which no mortal credits but themselves. One of my neighbours in Falsenberg believes the whole city to be somehow so deeply indebted to him, that when his fortune is utterly expended—and he is striving hard for that end—the burghers will feel bound to maintain both him and his family. Another imagines that the more unkind and tyrannical he may be to his children, relations, and servants, the more abundantly will they respect his old age, and cherish his gray hairs. I know one who is convinced that without his eating, drinking, and sleeping, the world could not exist; a second, who believes himself born schoolmaster to the entire universe; and a third, who expects that fame, friends, and fortune will come in search of him where he sits with his pipe and tankard. Delusions no less singular prevail among the dames of our city. The lady of a goodly mansion close by my stall has an inward persuasion that she saves her husband from ruin by expending fifty florins a week in keeping the house in continual tumult; while her opposite neighbour expects that a certain quantity of gay-coloured silks and hungary-

water will preserve her for ever young. Many live in the conviction, that neither the inhabitants of the town nor the strangers who visit it ever think or talk of anything but them; and others believe that they have done the community a signal service, and merited some public reward, by living like the wives of honest burghers.'

'Friend,' said the merchant, 'you spoke of doctors of philosophy as belonging to your town—has no treatise been written on this extraordinary madness?'

'None,' said the traveller; 'our philosophers have no time for the like. When they are not occupied with the categories and the predicaments, they are always engaged with the origin of matter, and the derivation of souls; besides, the learned doctors are subject to the prevalent insanity, and among many marvellous conceits I have always found them apt to fancy that words and science were the same thing, and that much talking was equivalent to proof on any subject.'

'Has no judicious traveller, then, observed and reported the wonders of your town; for in all the books I have collected and partly read,' said the merchant, 'I cannot recollect any account of Falsenberg?'

'Many travellers come from thence to your outer side of the world, but they write not of these things,' said the stranger; 'and few descend thither, because, as I take it, the light of our hemisphere is of a nature so different from yours, that no man might endure it except his eyes had been covered in the subterranean passage.'

'Friend,' said Fritz, 'beginning to suspect at once his learning and his ears, 'I cannot rightly understand you. What is this lower hemisphere of which you speak?'

'The under side of the world,' said the stranger, 'according to that chapter in the fifth treatise of the learned Paracelsus, which declares, that "the lower side of the earth hath air and clouds, sun, moon, and stars of its own; that there are there mountains and forests, rivers and seas, and men dwelling upon it, with flocks, corn, and cities; that the ancients believed the dead went thither, and called it the realm of Pluto; because in their times there were certain passages leading right through the solid earth, which had been formed by immemorial fires or great water-courses. By one of these Æneas descended, as Virgil relates; so did Orpheus in search of his lost spouse; and some yet exist; but great peril must be in the descent, because of the central attraction." Certain moralising men have indeed imagined that Paracelsus conveyed a fabulous meaning in this chapter; others have said that wine was stronger than wit with him when it was written; but fault and parable finders abound on both sides of the world.'

'True,' said Fritz; 'but that region is your country, and there is one of those passages in this neighbourhood leading direct to Falsenberg?'

'Undoubtedly,' said the traveller. 'A scholar, as I perceive you are, must know that he who first built and dwelt in this hermitage was one of the architects of that unfinished cathedral in which the nations were to pray at Cologne—a brother of the order of free and accepted masons, who, in right of his art, understood many secrets, and among the rest that ancient passage, which he either discovered or read of in the Almagist. Many a time, as I have heard them say below, the good man was making merry in a tavern yonder when the citizens here believed he was keeping vigil.'

'Come and shew me the passage, friend,' cried Fritz, springing from the broken wall.

'Take leisure, master burgher,' replied the stranger, as he leaned lazily back; 'that task is not quite so safe for me as you may think it. The senate of our town some centuries ago conceived a strong fear that Falsenberg might be overrun with troublesome strangers from the

upper world; and therefore, though they allowed the citizens complete toleration in the matter of going up, they made it death without benefit of clergy to shew your people the way down; and great peace they say we have had among us on account of that law.'

'Friend,' said the merchant, reseating himself, 'I commend your prudence; but as you are a poet, and instructed beyond the vulgar, I have confided to you that besides being a rich man and a scholar, I have a strong desire to see strange customs and distant countries, in order to write my travels for the benefit of posterity; and if you will guide me to your extraordinary town, I will cheerfully pay any reasonable reward you may ask, and doubt not that my discretion may be trusted.'

'I agree,' said the stranger, 'on three conditions: first, that you will meet me in this place two hours before the next daybreak; second, that you will consent to have your eyes securely bandaged, as I cannot consent to endanger any man's sight; and third, that on your return to your own house, you will send two dozen of the best Rhenish to the Cobblers' Tavern in Nuremberg, as your guide's reward.'

'It is small,' thought the merchant; but he added aloud: 'I accept the conditions; and be assured that the wine will be the best in Germany.'

'Good-night, then,' said the stranger: 'the gates of Nuremberg will be shut if you delay much longer. Remember, two hours before daybreak; and with a spring over the wall he dashed away into the now darkening country.'

There happened (and that was a rare case for those times) to be no war just then in Germany; the barriers of Nuremberg were therefore but slightly guarded, and the old watchman at the river gate considered Fritz the most liberal and enlightened of burghers, when he slipped a silver florin into his hand, with a hint that there was no necessity for strict locking up that night. The merchant had determined to see Falsenberg, though prudence suggested that some of the conditions were strange, and the traveller might be a robber. But he had never heard of robbers quoting Paracelsus; and as there was room for that and more in the faith of his age, a visit to the under side of the world, by the journey of a few hours, came so exactly up to his desire for achievement made easy, that Fusseldorf would have accorded some additional dozens of wine had his guide demanded them. His humble confidant, old Gretchen, who had kept his and his father's house for more than thirty years, was employed the greater part of the night in assisting him to select his best travelling gown, sword, and tablets for the journey, not to speak of a flask of the best Rostock and a bundle of strong sausages, safely packed in a well-concealed wallet, lest Falsenberg should afford no Christian fare. With these equipments, and an injunction to Gretchen to say he had gone to visit a relation in the country, the merchant, two hours before the breaking of the summer day, took his way through the river-gate towards the ruined hermitage. There, in the still starlight, sat the stranger, on the same broken wall where he had first found him; but by his side lay a strong, coarse napkin, with which, before Fritz had finished his salutation, he proceeded to bind up his eyes so securely, that the prudent burgher congratulated himself on absolute safety in that quarter. 'And now,' said he, taking him by the arm, 'friend, hold fast by me, and keep your feet steady, for we are about to descend, and the path is steep. I suppose,' continued the stranger, as they advanced a few steps further, 'you perceive the great declination of our way. We will soon be within the sphere of the downward forges, which hasten the progress of all bodies, and will make our speed exceed that of an eagle.'

Fritz had not at first perceived this astonishing declination, but he was far too judicious to manifest such

dulness of apprehension; and as his guide continued to warn him of the steepness of the path, and the ever-increasing speed of their descent, both became apparent, and fear began to creep on the burgher's mind. 'We are now near the end of our journey,' said the stranger at length, to his great relief; 'and as you are a traveller whom it would not be safe for one to acknowledge in our town, I will take the liberty of conducting you to the very door of one well known as a rich and substantial man among us. In his house you will be sure to find entertainment; but let me warn you, that of all Falsenberg he has contrived to forge the most extraordinary deceits for himself. In the first place, I have been told that he imagines certain heaps of waste paper laid up in the corner of one's house is sufficient to make him a scholar; secondly, that mere dulness of life and thought are the very ingredients of wisdom; thirdly, that money will buy off all evils, in this world and that to come. But his fourth delusion has been variously reported, for some say it consists in a belief that all the city will obey him after his funeral, and some that it is a remarkable mistake in numbers, by which he is positive that eighteen will exactly correspond with fifty. Now, thank the stars,' added his guide, giving Fritz a sort of twirl, 'we are here on firm ground within the city gates; the towers and churches rise round us in the summer night; we pass by the dwellings of sleeping thousands; and yonder calls the watchman.'

Fusseldorf did indeed hear the long shout of the night-guard, and knew by other sounds that he was treading a city street.

'Here, friend,' said the stranger, pausing in the walk, 'you are now close beside our oldest church, and near the house of that most deluded citizen. I go home, for prudence' sake, you know, and when the clock strikes, pull off the bandage and find your own way.'

His words were almost lost in a run from the merchant's side, and the sound of a church clock chiming four. With the last stroke Fritz had pulled off the bandage, and found himself standing in front of his own house, hard by the old church of St Sebald, in the good town of Nuremberg, and in the early gray of a summer morning. The native of Falsenberg was gone. Fritz never saw him after, and most people agree that the greatest sign of his wisdom was given by making no inquiry on that subject; but with him seemed to vanish Fusseldorf's projected travels, his edifying volume, and his college scheme—at least the honest burghers heard of them no more; and the goldsmith, who had lately taken to consulting Fritz on family affairs, was particularly astonished at his serious advice to bestow Gertrude in marriage on his faithful apprentice and cousin's son Heinrich. For that counsel both daughter and apprentice promised to pray for him as long as they lived; but although it was eventually acted upon, neither tale nor chronicle has recorded how they kept their vow. The reputation of learning and prudence attended Fusseldorf to a good old age, though murmurs against it arose among his nearest relations when Legilend and her tapestry-frame took triumphant possession of his mansion, in the chief apartment of which was long to be seen the famous hangings, on which that mistress of the needle expended fifteen years in portraying the nine worthies of Nuremberg, with her husband in the van, marching to paradise under the conduct of the cardinal virtues. From the discreet and tranquil life which Fritz continued to lead, even after his marriage, scholars have not found it easy to settle how the adventure of this tale was first published. Some say the manuscript was found among his papers; some that the story was revealed to old Gretchen in an unadvised moment, when restoring to her custody the flask of Rostock and the prepared sausages; and others are positive that the whole was related in one of the many unwritten moralities of Hans Sachs, the renowned

poet-cobbler, and hence became traditional in Nuremberg, where old men still speak proverbially of the prudent merchant and his strange travels to the City of the Deceived.

ATLANTIC STEAM NAVIGATION.*

THE first application of steam power to the purposes of oceanic locomotion was made in the navigation of the northern portion of the Atlantic as early as 1819. In that year the American steamship *Savannah*, of 850 tons, crossed from New York to Liverpool in twenty-four days. During most of this period her engines were in operation; but their power was disproportionately small, and it is probable that the steamer was as much indebted for her progress through the deep to the influence of the wind upon her canvas as to the action of her paddle-wheels. As might have been expected, in the case of the first ocean steamer, the internal arrangements of the *Savannah*, so far as room for merchandise and passengers was concerned, were extremely defective. Her machinery and steam apparatus occupied so large a portion of the hull, that this, together with the space necessary for the stowage of coal, left scarcely any room for cargo. The construction of her paddle-wheels was peculiar: they were attached to an iron axletree passing through the sides of the vessel above the bends; and their parts were so arranged that, with the exception of two heavy arms of cast-iron, the whole propulsive apparatus could be taken to pieces, and packed on board the vessel.

Novelty and adventurous daring more than anything else have rendered celebrated this first experiment in ocean steam navigation. As a useful or profitable speculation it was a complete failure: nor can it even be said that the result of the attempt was at all indicative of eventual success. The carriage of a cargo insuring remunerative freights was impossible in the case of a vessel which could scarcely contain within herself the supplies requisite for a single voyage; and so incredulous of the powers of man's ingenuity and perseverance were even well-informed minds, that for years after the date of the experiment we have mentioned, many eminently scientific men declared impossible the removal of this fatal objection to ocean steam navigation. But, like many other prophecies which have been made regarding the limits of human performance, the one now referred to proved totally incorrect. The difficulties connected with this arduous undertaking, which in 1819, and for years afterwards, appeared so immense, and wellnigh insurmountable, were at length fairly and for ever removed by the successful transatlantic experiments of 1838.

The first English steamship which left this country for America was the *Sirius*. She had originally been intended for, and employed as a trader on, the east coast of the island. The *Sirius* left London for Cork toward the end of March 1838, whence, after some delay consequent upon an accident which she had received on her passage thither, she started for the commercial capital of the New World on the 4th of April of that year. She reached her destination on the 28d of the month—the same day as the *Great Western*, which had left Bristol four days after the departure of the *Sirius* from Cork. The time occupied by these two vessels in their voyages out was 18½ and 14½ days

respectively. Although the duration of their passages was thus widely different, both vessels consumed as nearly as possible the same quantity of fuel—namely, 458 tons. The *Sirius* had exactly this quantity of coal on board when she left Cork, and would have entered New York harbour without a particle of this precious commodity remaining, had she not used, toward the end of her journey, as an equivalent for 23 tons of coal, 48 barrels of resin. The *Great Western*, now the property of the West India Mail Company, continued to sail on the route between New York and Liverpool for about ten years. Her voyages were on the whole performed with regularity; and she ever proved herself a good sea-boat in the many severe storms—in one case appalling tempest—which it has been her lot to encounter. Her average passage to New York occupied 15 days, and from New York 13½ days. Her shortest run westwards was, we believe, performed in 18½ days, and eastwards in 12½ days. The *Great Western* is a vessel of 1310 tons burthen, with engines of 460 horse-power. She was built at Bristol, and measures 240 feet in length.

The two vessels now mentioned were the property of separate companies. Contemporaneously with them a third company was formed, who owned two other steamships—namely, the *Royal William* and the *Liverpool*, both of which in the same year (1838) commenced to ply between this country and America. The *Sirius* belonged to, or rather was chartered by, that company who, in the following year, built the *British Queen*, and subsequently the *President*: the *Great Western* to that company who constructed that leviathan screw-steamer—the *Great Britain*. The ports of departure of these three separate sets of transatlantic vessels was originally, and for some years, Portsmouth, Bristol, and Liverpool respectively; but latterly the superior advantages of the Mersey as a starting-point for American vessels became apparent, and Portsmouth and Bristol were deserted.

The *Great Western*, the *Royal William*, and the *Liverpool* were all built much about the same time. The first began to ply in April, the second in July, and the third in November 1838. Neither of the two last were so powerful as the Bristol steamer. The *Liverpool*, the larger of the two, was in extreme length 6 feet shorter than the *Great Western*, and her engines were by 10 horse-power of less force.

Of the performances of the Liverpool Company's steamships we do not possess very lengthened accounts. This is especially true of the voyages of the *Royal William*. After a careful search in several of the newspapers of that period, we have failed to discover any notices of her passages, or indeed any information regarding her posterior to January 1839. We are inclined to think that she must have been withdrawn from the station in the early part of the spring of that year. The average of the six voyages she made down to this date was 20 days for her outward, and 15 days for her homeward passages. The average of the eastward voyages of her sister vessel was the same, but that of the westward passages of the *Liverpool* was by three days lower. The last-reported trip by this steamer which we have been able to discover is one from the Mersey to New York in November 1838, occupying 18½ days. In the middle of December she again, and for the last time, we believe, left America for England. Shortly after her arrival here she was transferred to another station. When wrecked, as she was a few years ago, the *Liverpool*, or *Great Liverpool*, as she was then called, was the property of the Peninsular and Oriental Company.

About the middle of 1838 there was laid down on the banks of the Thames the keel of a transatlantic steamer, whose gigantic proportions formed, for a long time after her construction, a theme of speculation and

* In No. 339 there is a less complete article on this subject, devoted chiefly to a description of the *Atlantic* steamship.

general astonishment. The hull of the *British Queen*—for it is to her we now refer—was completed in the spring of 1839, when she was brought down to the Clyde, where her machinery was constructed by Robert Napier, whose celebrity as a marine engineer had been already established by the successful performances of numerous large coasting steamers, and whose name now stands associated with the most splendid triumphs in oceanic locomotion which the skill of the mechanician has ever yet achieved. From figure-head to taffrail the *British Queen* measured 275 feet—that is 35 feet more than the *Great Western*, the largest Atlantic steamer then existing. Her breadth of beam, exclusive of paddle-boxes, was 80 feet, and including paddle-boxes, 61 feet; her depth of hold was 27 feet; and her engines were of 500 horse-power. The *British Queen* started on her first trip from Portsmouth on the 12th of July 1839, with a full complement of passengers, a crew of 100 men, 800 tons of goods, and 600 tons of coal. There was said to have been afloat in her, when leaving the harbour, property to the value of one and a half million sterling. She reached New York after a good passage of 14½ days. Before the conclusion of the year she made five more voyages—two out and three home. The former were performed in 17 and 20½ days respectively; the latter in 13½, 13½, and 22½ days. Compared with those of the *Great Western* during the same period, the passages of the *British Queen* were not quite so good. This steamship is now the property of the Belgian government.

While the existence, during 1838 and 1839, of transatlantic steamers had unquestionably been the means of conferring great benefits on the mercantile classes both of England and America, yet neither the government of this country nor the public generally had derived from this means of international communication all the benefits which, with a little management, it was calculated to afford. From the route hitherto adopted, the practical distance between us and our Canadian possessions had not been much diminished, while, from the absence of method in the departure of the several steamers, arising principally, perhaps, from the rivalry and non-accommodating spirit more or less characteristic of all competing companies, there was wanting that faultless regularity in the despatch and receipt of intelligence, which, whether in matters of political or commercial information, is of the first importance. To secure this desirable object, and bring our colonial dependencies on the other side of the Atlantic as near as possible to the mother country, government proposed to establish a regular postal communication with Halifax and Boston. Motives of economy at once suggested the propriety of devolving, if possible, upon some private association the performance of this mail service. The *Great Western Company* were unsuccessful applicants for the contract; and the advantage of undertaking it was strongly urged by one or two sagacious individuals upon the capitalists of Liverpool. But the latter were reluctant to engage in the enterprise; and partly by interest, but principally by the advantageous terms they proposed, and the efficient manner in which they were ready to bind themselves to perform the service, a few merchants in Glasgow, represented in their deed of engagement by Messrs Samuel Cunard of Halifax, George Burns of Glasgow, and Charles M'Yer of Liverpool, obtained, in preference to all other competitors, the execution of the contract. Early in 1839 the preliminary arrangements were concluded; and in July of the following year the mail service was commenced by the *Britannia* steamer, which, including the detour and a detention of 12 hours at Halifax, completed the voyage from Liverpool to Boston in 14½ days.

For the sake of brevity as well as clearness, we shall here anticipate in some measure the due course of our narrative, and present our readers with a tabular view

of the vessels built by the Cunard Squadron down to the present date:—

Name.	When Launched.	Tonnage.	Length.	Horse-power.
Britannia,	February 1840,	1184 tons	204 feet	440
Acadia,	April 1840,	1135 ...	203 ...	440
Caledonia,	May 1840,	1138 ...	203 ...	440
Columbia,	September 1840,	1175 ...	206 ...	440
Hibernia,	September 1842,	1421 ...	218 ...	500
Cambrisa,	August 1844,	1423 ...	218 ...	500
America,	May 1847,	1826 ...	249 ...	650
Niagara,	July 1847,	1824 ...	249 ...	650
Europa,	September 1847,	1824 ...	249 ...	680
Canada,	June 1848,	1826 ...	249 ...	680
Asia,	January 1850,	2226 ...	265 ...	750
Africa,	June 1850,	2226 ...	265 ...	750

This fleet, forming without exception the most splendid array of ocean steamers ever possessed by one company, has been constructed on the Clyde, and engined by Robert Napier of Glasgow. Mr Steele of Greenock has been the builder of all the vessels excepting the *Acadia*, *Europa*, *Britannia*, and *Columbia*. Of these the first two were built by Mr John Wood, Port-Glasgow; the third by Mr Duncan of Greenock; and the fourth by Mr Charles Wood of Dumbarton.

Since the formation of the Cunard Company, there have been one or two alterations in the terms of their contract with government. Originally, their steamers were under engagement to carry the mails once, and shortly afterwards twice a month between Liverpool, Halifax, and Boston, and *vice versa*; some years afterwards New York was, every alternate voyage, substituted for Boston. About three years ago the government allowance to the company was increased to £145,000 per annum; and they became bound to make throughout the year—except during the four months of December, January, February, and March—weekly instead of fortnightly trips to Boston and New York alternately, constantly calling at Halifax. The last change occurred in September 1850, when permission was granted to the Cunard Company to make the fortnightly passage to New York *direct*, instead of going, as formerly, by way of, and calling at, Halifax. The arrangements regarding the bi-monthly service of mails during a third part of the year, as above explained, still exists; and the present contract is to remain in force till 1858.

Contemporaneously with the first set of the Cunard Squadron appeared that ill-fated steamship the *President*. She was built and fitted up at Blackwall, and in general dimensions much resembled the *British Queen*. The *President* carried two funnels, and sat high out of the water. She made but three voyages across the Atlantic. Her first trip out to America was a tedious one. On her return passage, which commenced on the 2d November 1840, she encountered very severe weather; and after being out three days, during which time she had consumed a large portion of her coal, and made but very little way, she was obliged to return to New York to obtain a fresh supply of fuel. On the second attempt she made Liverpool after a rough and protracted passage of seventeen days. Her outward voyage to the United States in February 1841 was her last. On the 10th March of that year, with twenty-three passengers aboard, she left for Liverpool. Immediately on her departure she encountered a very severe tempest; and on the 18th instant was descried by a packet-ship labouring very heavily, and evidently making but little progress. This, we believe, was the last time she was ever seen. Her fate will ever remain a mystery.

In the case of the steamers hitherto mentioned, wood was the material of which they were constructed, and paddle-wheels the mechanical contrivance by which motion was imparted to them. We have now to allude to a transatlantic steamship which, in addition to her enormous proportions, was built of iron, and propelled by means of an Archimedean screw: this was the *Great*

Britain, a vessel of 1000 horse-power, and 3444 tons—She was built and engined at Bristol, and in extreme length measures 322 feet. The *Great Britain* was released from her long and ludicrous durance in Cumberland Dock, Bristol, toward the beginning of 1845. She made but two passages across the Atlantic; and in neither of them did she realise the expectations which had been formed regarding her speed. The last departure of the *Great Britain* for America took place on the 22d September 1846, when she had on board 185 passengers and a very considerable cargo. She cleared from the Mersey under the most propitious circumstances. The wind was favourable, and her screw, which had lately undergone repairs, was in excellent working order. But, unfortunately, these propelling agents, which it was supposed were hastening her onward to New York, were only enabling her to make an inglorious run across St George's Channel. At half-past eight o'clock evening, when all was mirth and merriment on board, the passengers were alarmed by a sudden shock, the cause of which, as a little observation served to shew, was that the vessel had run ashore in Dundrum Bay. She lay there for 339 days. Toward the close of last year the *Great Britain* was purchased for the sum of L.18,000, and is now being refitted, and prepared for active service.

In transatlantic steam navigation—for the case of the *Savannah* can scarcely be held to form an exception to the remark—the Americans took no active part until 1846. In that year an association was formed, with the view of establishing an intercourse, by means of steamers, between Bremen, Southampton, and New York. It assumed the title of the Ocean Steam Navigation Company, and the monthly service commenced by it in September 1847 still continues. The steamers belonging to this company are the *Washington*, *Hermann*, *Franklin*, and *Humboldt*, which last is not yet finished. The first two of these steamers, launched in 1847, have not turned out so well as the *Franklin*, launched last year. Instead of proving swifter vessels—as it was confidently predicted by their owners they would—than those of the Cunard Squadron, the latter steamers usually beat them by two days—sometimes even by four—in their passages across the Atlantic. Indeed, so inferior were the two steamships now mentioned to the Boston and Halifax mail-packets, that the former have never, properly speaking, proved themselves rivals of the latter at all; and however creditable, as a first effort in oceanic steamship building, the construction of these two vessels may have been, the vessels themselves, compared with those with which they were designed to contend, were decided failures.

But failure does not damp the enterprise of the American people. Their motto is, 'Try again.' Acting upon this principle, they have tried again; and in their second attempt have probably as much surpassed our anticipations respecting their oceanic achievements as in their first attempt they fell short of their own.

The United States Mail, or as they are otherwise more laconically styled, the Collins Steamers, are the *Atlantic*, *Pacific*, *Arctic*, *Baltic*, and *Adriatic*. The four first are finished; the fifth is now in progress. All of them have been built, engined, and equipped at the Novelty Works, New York. Their machinery is of 1000 horse-power, and their principal dimensions are as follows:—Length, 290 feet; breadth within paddle-boxes, 45 feet; depth of hold, 31 feet 7 inches; and tonnage, 3000 tons. The passenger-accommodation of these steamers is excellent. The cabins are very roomy, and the greatest attention has been paid to good ventilation. A perfect fortune has been expended in the decorations of the saloons; and the entire cost of each steamer is estimated at not less than L.115,000. A large proportion of the money with which they have been built is English capital; and in fulfilment of a

condition annexed to the advance, all the Collins steamers are insured in this country.

With mention of the *Sarah Sands* and *City of Glasgow* our present sketch terminates. Both belong to a class of vessels now rapidly on the increase, and which promises soon—for certain tracks at least—entirely to supersede paddle-wheel steamers. This is the class of 'auxiliary screw propellers,' which differ from the principle of construction of the *Great Britain* only in this respect, that in their case the proportion of steam-power to tonnage is very much lower; and their screw is intended not as the principal, but as a subsidiary motive agent to the propelling influence of wind. The *Sarah Sands*—an iron vessel of 1300 tons and 180 horse-power—was built at Liverpool in 1846, and made, during the two following years, between that port and New York, nine voyages. The average of her passages outward was 18½ days, and homeward 16½ days. The *City of Glasgow*—likewise of iron—was built at Glasgow by Messrs Tod & McGrigor in 1850. She measures 1610 tons, and is furnished with engines of 350 horse-power. For some time she was owned by her builders, to whom belongs the honour of having first established a regular steam-communication between the Clyde and America. Toward the close of last year she was purchased by a Liverpool firm, and is now engaged in the trade between that city and Philadelphia. Her success has been perfect; and both in regard to speed and carrying power she displays a marked superiority over her predecessor.

RAILWAY-TIME AGGRESSION.

THERE is an 'aggression' far more insidious in its advances than the papal one, and more wide-spreading in its effects, which is stealthily yet steadily progressing among us, and to whose impertinent attacks we would fain direct the indignant energy of our countrymen. Yes! Time, our best and dearest possession, is in danger. Old Time, beneath whose fingers tyrants tremble and empires crumble into dust, is now bearded—we had almost said successfully bearded—by a power whose age is but of yesterday. He who, during the 'flight of ages past,' has only deigned to 'measure his motions by revolving spheres,' is now obliged, in many of our British towns and villages, to bend before the will of a vapour, and to hasten on his pace in obedience to the laws of a railway company! Was ever tyranny more monstrous or more unbearable than this? It has not even the merit of a poetic grandeur to redeem its attendant evils, for it is essentially prosaic both in its aim and tendency, and, like all the baser tyrannies, it intermeddles with the domestic doings and social charities of life. Facts often speak more authoritatively than words. We shall therefore illustrate our meaning by the history of our own experience during a recent visit which we paid at a fashionable watering-place in the south of England.

On arriving at my friend's house, where I had promised to pass a few weeks, I found that a dinner-engagement had been made for that day, in which I was included. 'And,' said Mr Thompson, addressing his daughter, who was present, 'you must take care to be ready in time, as our good friends the Derings are, you know, very precise, and do not like their dinner to be delayed.' The young lady promised to be ready in proper time, and the dinner-hour being half-past six, we took care to drive up to Mr Dering's door a minute or two before that hour was indicated by our watches.

'We are in capital time,' observed Mr Thompson as he was stepping out of the carriage. On entering the drawing-room we found a large party already assembled, and although courteously received by our hosts, yet there was evidently a cloud resting on the brow of

Mr Dering, who, the moment after we were seated, addressed his wife in an abrupt tone, saying: 'I think, my dear, we had better order dinner now; Mr Cumming is too young a man to have any right to keep people waiting for him; and,' added he in a lower voice, yet loud enough for me to catch the words—'as it is, the dinner will be spoiled.'

Just at this moment Mr Cumming was announced, and our host, while shaking hands with him, said, half-gravely, half-jocosely: 'Ha! my good friend, so here you are at last! You are too fashionable a fellow, I suppose, ever to think about the hour?'

'Indeed, my dear sir!' replied the young man, looking a little discomposed at this sudden attack, 'I flattered myself with being punctual to a fault to-day;' and so saying, he drew out his watch and shewed that its hands were resting precisely on the hour of half-past six.

'But that is not railway-time,' observed Mr Dering; 'and you know that since yesterday morning, when the town-clock was changed, we have set all our watches and clocks by London time; so,' added the old gentleman with evident self-complacency at his own correctness, 'it is now not far from seven o'clock.'

'Ah! this accounts for my misdemeanour,' said Mr Cumming good-humouredly; 'for I have been spending a few days in the country, where the clocks are so old-fashioned as to be guided by the sun instead of the railway; so I know nothing of your modish ways here.'

'I have not the same excuse for my ignorance,' observed Mr Thompson, who had listened to the discussion; 'for I have been almost within hearing of the town-clock, and yet know nothing of the change: so we came to dinner by the old time; and my friend here has, I daresay, set me down also as a fashionable, irregular sort of man.'

'Well, gentlemen,' replied Mr Dering, who had by this time recovered his good-humour, 'I can only say, that if the dinner is spoiled, you must lay it to the score of railway aggression, which will not suffer us to measure time, as our forefathers did, by the course of the sun.'

At this moment a spruce, busy-looking man approached the group of talkers, and began to prove how advantageous it was that the whole nation should observe the same time; when fortunately dinner was announced, and a more welcome subject of discussion offered itself to the party than the comparative advantages of real and of railway time. It was not long, however, before this 'monster evil' presented itself again to my notice; for in the course of the evening, as I was sitting near the lady of the house, she called over her youngest daughter, a blithe, happy-looking child of seven or eight years old, and told her it was time for her to go to bed. The little girl, in the exuberance of her spirits, ventured to remonstrate against the command.

'You know, mamma, that whenever there is company, I am always allowed to sit up till nine o'clock, and it is not near that time yet.'

'You are mistaken, my love,' replied her mother; 'for I heard the clock on the mantelpiece strike just now; and if you go and look at it, you will see I am right.'

'Oh! that clock is all wrong. I heard Janet say so when she was dressing me this morning, and Miss Cooper found fault with our not being ready at eight o'clock for our lessons; and Janet said she could not be plagued about the new-fashioned time; so she went be upstairs to undress me for a whole quarter of an hour to come. You see, then, mamma, there is no use in my going away yet, and I am so happy!'

The twofold argument was irresistible; and Rosa was suffered to rejoin the kind lady who had been amusing her. Mrs Dering, turning to me, said that it was rather amusing to hear of a feud between her governess

and maid concerning the right hour of the day; 'And,' added she, smiling, 'Janet is so old a servant, and so important a person in our family, that Mr Dering will find it no easy matter to make her comply with any newfangled law; but I must try to win her over to submission.'

I sympathised with the good lady on the difficulties of her position; and two or three hours later, when I found myself alone, and recurred in thought to the social enjoyment of the past day, a vision of discomfort intruded itself into the pleasant remembrance, and I marvelled how it came that railway aggression should have so easily disturbed the equanimity of a friendly party, and created a feud within a quiet and well-ordered family.

Having taken care to set my watch by railway time, I retired to rest, and on the following morning rose early, to enjoy my usual quiet walk before breakfast. I strolled into the green lanes adjoining my friend's house, and the morning air was so full of fragrance and harmony—flowers and birds seeming to vie in the expression of praise and joy—that I went along without regarding whither the path might lead me; and on a sudden turn in the lane, was surprised to see before me an old gray church, whose tower rose up gravely from amid avenues of elms. The scene was so still and sober in its aspect, that on advancing towards the church I wondered to perceive a certain degree of stir and bustle near the door. Several men were lounging about, and one of them had an air of authority about him, which bespoke him to be either the parish clerk or beadle. I inquired of him whether there was early service in the church.

'No, sir,' replied he; 'but we are going to have a grand wedding here this morning; and as I am the beadle, it is my business,' added he with an air of importance, 'to prepare for it.'

'It is rather early in the day for a wedding, is it not?' inquired I of the hoary official.

'The gentfolk usually come much later to be married, it is true, sir,' he replied; 'but this gentleman, I am told, means to take his lady a mortal way off to-day, so we have had notice that they will be here exactly at eight o'clock.'

'Then you may expect them immediately,' observed I, pulling out my watch, 'for it is now precisely eight o'clock.'

'—You must pardon my boldness in contradicting you, sir,' said the old man, looking up towards the church clock, 'but it wants yet full twenty minutes to eight.'

'Oh, you don't go by railway then?' observed I, inquiringly.

'Railway time!' repeated the beadle, drawing himself up with a look of displeasure. 'No, indeed, sir: we leave those newfangled notions to upstarts and Radicals. The church keeps to the good old ways; and please God she will stick to them, in spite of her enemies.'

It was with difficulty I could refrain from smiling at this outburst of indignation at the ideal enmity of railway-time abettors to the church; but my attention was at this moment drawn to two carriages which were approaching; so I said to the beadle: 'Whatever may be the church's opinion on this subject, her members differ very much about it; and as a proof of what I say, here comes the wedding-party at three minutes past eight by railway time.' The old man, muttering to himself that 'they must wait for the canonical hour, otherwise it would be no marriage at all,' hastened to the western door to meet the bridegroom.

Let it not be imputed to mere vulgar curiosity that I followed him thither; for the fact is, that, although myself a confirmed old bachelor, I love to see young people look happy as they are wont to do at a wedding; and I like to look upon a fair bride in that hour of trembling hope and awe, when even an old man's prayer may be heard for blessings on her wedded life.

On approaching the church I saw no impatient bridegroom issuing out of the carriage as I had expected. There first appeared a gentle, pleasant-looking girl, whose attire at once marked her as the observed of all observers—the bride. Her father offered her his arm, and they entered the church, followed by the mother leaning upon her son, and two youthful ladies who looked like bridesmaids. The elderly gentleman addressed some questions, which I did not overhear, to the beadle, across whose features stole a smile of satisfaction as he replied in an audible tone, that 'neither the young gentleman nor the parson had arrived yet.' 'Very strange,' said the father; 'he begged of us to be here punctually at eight o'clock. There can surely be no mistake.' And he glanced at his daughter, whose cheek had suddenly assumed a deadly pallor.

I had entered the church, and quietly ensconced myself in the corner of a pew behind a pillar. The bridal party seated themselves in a square pew close to the altar. There was a deep stillness in the church. Minutes passed on. Doubtless they seemed to be hours in the estimation of some of those present. Once the door creaked, and I observed the young lady start and tremble, while a hurried glance towards the door betrayed her anxiety. Who can tell what visions of danger for the beloved one may have floated through her mind during this brief period of perplexity and suspense! My own heart began to beat with anxiety concerning the issue of the matter, when at length carriage wheels were heard approaching. The young lady's head seemed to droop as she caught the nearing sound. A moment later, and the clergyman came out of the vestry. I could scarcely forbear saying: 'Pshaw! is it only you?' But almost at the same instant appears a gentleman, who evidently was 'The Man.' His glance turned uneasily towards the pew, as if he were disappointed at being the last of the party. One of his attending friends whispered in the ear of the young lady's brother, who pulled out his watch. A smile and a nod were interchanged between them. The brother said a word to his sister, who looked up and smiled amid her blushes. I overheard the words 'railway time.' The whole mystery was explained. The bridegroom had arrived five minutes before the appointed hour, according to the old style of time, knowing that an earlier moment would have been without the pale of canonical hours, and consequently not suited for the marriage ceremony. The mistake was now, however, cleared up; and as the young couple stood before the altar and pledged themselves to a lifelong love of tenderness on the one side, and of obedience on the other, higher and happier thoughts must have crowded into their minds, so as to leave no room for the intrusion of petty disturbance; but I, during my homeward stroll, pictured to myself anew the intense anxiety which had been so perceptible in the face of the bride during those long, interminable minutes, until at last I wrought myself into impatient displeasure at the railway aggression, which, by disturbing the course of time, could thus trouble the most joyous seasons of life. On seating myself at the breakfast-table, I related my morning adventure, to the great amusement of my friend, who laughed heartily at my sudden fit of indignation against the modern encroachments upon time; but I was fully compensated for his merriment by perceiving that his daughter looked very kindly upon me when she found that I had sympathised so fully in the anxiety of the bride.

The following day was Sunday. I inquired in the morning at what hour divine service began. 'At eleven,' was Mrs Thompson's answer.

'Railway time, I presume?'

'Yes; at the church which we attend,' replied the lady; 'but at the other one, which is quite a Puseyite concern, they go by the old time.' Maria Thompson, colouring slightly, reminded her mother that the real

time was observed at St Anne's, because, being a parish church, it was necessary to attend there to the canonical hours.

'They have always some excuse for their vagaries,' replied Mrs Thompson; 'but every one knows it is all mere Tractarianism—popery in disguise.'

Mr Thompson looked over his spectacles at the two ladies, and an incipient smile lurked around his lips, but he held his peace. A wise man!—and how often would these sparks of discord go out if they were not fanned into a flame by well-meant but officious interference! For my part, I felt sorely tempted to assure the good lady that popery had nothing whatever to do with the matter; but following my friend's example, I remained silent.

Here was a new phase of railway aggression and its attendant evils—one which I had not dreamed of before; evoking as it did party names in a parish, and lighting up a torch, or at least a taper, of discord in the bosom of an amiable and united family. My wrath was waxing hotter and hotter every moment against this monster evil of the day.

During the ensuing week the same subject was, in one form or other, continually brought before my attention. Some stanch conservatives complained that this change of time was effected by the progress party, and that they would not suffer it to continue without a struggle. On the other hand, many of the poorer classes said it had been done merely to please the gentry, who travelled about, and liked, for their own convenience, to know precisely what was the railway time. The result of this general ferment was a public meeting, in which many unwise and hard words were spoken on both sides, without any definite arrangement being made on the subject. The ladies, who could not speak in public, made ample amends by grumbling in private; and the inconveniences they complained of, although minor ones, were not the less annoying to them. One lady who belonged to the progress party told me, that having been asked to tea at eight o'clock, on entering her friend's house she saw the servants carrying in the dessert; 'so I had to wait half an hour alone in the drawing-room,' said she, 'where I found the clock had not been changed, as it ought to have been, to the London time, and I had to apologise to the lady of the house for my seeming vulgarity in having come so early.'

'A very mortifying incident in your life,' said I with composed gravity of countenance.

'And I,' observed a languid-looking lady, 'was nearly bored to death last night; for having invited a large evening party, nearly half the company arrived before my rooms were lighted, and it really made me quite nervous to be taken thus by surprise. They might have known my principles better than to suppose I would adopt newfangled plans all in a hurry.'

'Principles!' muttered I almost unconsciously to myself. The speaker did not overhear me, however, and went on to say that what provoked her most was, that all the dullest of her company remained half an hour later than the rest, on the plea that they had ordered their carriages by the real time. 'And so,' added she, yawning at the bare recollection of what she had undergone, 'I had such a long evening of it!'

Such were some of the miseries which were crowded into one short week by the tyranny of the Railway-time Aggression! And is it possible that this monster evil, with its insidious promises of good and its sure harvest of evil, will be tolerated by freeborn Englishmen? Shall it be said that they who cling so earnestly to the good old ways of their forefathers are the only people who suffer their earliest possession, their lifelong friend, to be thus cruelly outraged and set at naught? Surely not! Let us rather rally around Old Time with the determination to agitate, and, if needs be, to resist this arbitrary aggression. Let our rallying cry

be: 'The Sun or the Railway!' Englishmen! beware of delay in opposing this dangerous innovation! No time is to be lost—

'Awake, arise, or be for ever fallen!'

LIBERIA.

THE new republic of Liberia is one of the notable features of our singularly-progressive age. It is one of the things which the people of the eighteenth could have least expected to be produced by the nineteenth century. Yet it is probable enough that many not unintelligent persons in England never even heard of its name.

Liberia is a free negro Christian state, enjoying republican institutions, on the coast of Africa. Situated between the fourth and eighth degrees of north latitude, it occupies about 500 miles of what is called the Guinea coast—a country wonderfully rich in natural productions, but heretofore blighted by the accursed slave-trade. The proper citizens of Liberia are said to be little over 7000; but they have a quarter of a million of the native population under their protection. They are distributed through a chain of well-built towns, surrounded by well-cultivated fields; they have ports and shipping, customhouses, a president, and a national flag. Churches and schools everywhere give pleasing token of civilisation. The people in general seem to be animated by a good spirit. On the whole, Liberia is a thriving settlement, and its destiny appears to be one of no mean character.

The efforts to put down the African slave-trade by a blockade have, it is well known, been signally unsuccessful. Britain's share in it costs about three-quarters of a million per annum; and the money is spent not merely in vain, but to the increase of the inhumanities meant to be extinguished. Under the powerful temptations held out by the sugar-trade of Brazil, more slaves are now exported from Africa than ever—the only effect of the blockade being to cause the trade to be conducted under much more cruel circumstances than formerly. While this costly and mischievous mockery has been going on, a humble and almost unnoticed association of emancipated negroes from the United States has been doing *real work*, by quietly planting itself along the African coast, and causing, wherever it set its foot, the slave-trade to disappear. Strange to say, it has done this, not as a primary object, but as one only secondary and incidental to a process of colonisation, the prompting causes of which were of a different, and, as some might think, partly inconsistent nature.

The situation of the free negroes in the United States is well known to be an unpleasant one. They have neither the political nor social privileges of other citizens; and though matters were put formally to rights in this respect, it is to all appearance hopeless that the coloured should ever be admitted to a true fellowship with the white people. In these circumstances the man of African blood is like a small tree under the shade of a great one. His whole nature is dwarfed; his best aspirations are checked. The results are not over-comfortable for the white man either. Some American citizens, seeing and deploring these evils, were induced, about five-and-thirty years ago, to form themselves into a society, which should promote the return of emancipated negroes to their own quarter of the globe, where it was thought they might be able, to some extent, to introduce the intelligence, religion, and usages of civilised communities among their benighted brethren, and form the most effective of battalions for the repression of the slave-trade, their constitutions being able to endure climatic influences, under which the whites are sure to sink. The result has been this republic of Liberia. The whole movement has, we believe, from first to last been regarded with jealousy,

if not hostility, by the Abolition party, who saw in it only the dislike of white for black, and shut their eyes to the religious and philanthropic objects, which were in reality alone capable of being promoted to any considerable extent; for of course a serious diminution of the coloured population of America by such means is not to be expected. We do not profess to know how far this was a reasonable feeling on the part of the worthy men who are standing up for negro rights in America; but assuredly, whatever were the motives of the Colonisation Society, the consequences of their acts are such as to give them no small ground for triumph. For anything that we can see, their settling of Liberia has been the most unexceptionably good movement against slavery that has ever taken place. Perhaps it has not been the worse, but rather the better, of that infusion of the wisdom of this world, which has discommended it so much to the Abolitionists.

It occurs to us that the Colonisation Society needs no other defence for its policy than to point to the spirit which has all along animated the black people who emigrated to Africa. One sentiment, that it was worth while to encounter all possible hardships and dangers on a foreign strand for the sake of *perfect freedom*, appears in the whole conduct of these men. They appear to have been generally persons of decided piety, and the missionary spirit is conspicuous at every stage of their proceedings. Not less important as a testimony to the same effect has been the energetic contention which the colonists have kept up against the slave-dealing propensities of the native princes. These men felt from the first that the Liberians were enemies to that traffic which gave them their most valued luxuries, and here lay the greatest difficulty which the settlers had to encounter. Their early history is a series of martyrdoms visited upon them by the slave-trade.

The first party of colonists landed in 1819 at Sherbro, and almost immediately were afflicted to a grievous extent by the diseases incident to the climate. Several white gentlemen, who acted as leaders, sunk in succession under the effects of fever. It was not till the spring of 1822, and after undergoing an immense amount of hardship, that the colonists obtained their first certain footing at Cape Mesurado, where they forthwith planted a village and fort. Almost immediately after having sold them the land, the barbarian King Peter resolved to extirpate them, being afraid of their interferences with his slave-dealing arrangements. Behold, then, thirty-five liberated negroes from Pennsylvania and Maryland perched on an African promontory, with their wives and children about them, and obliged to defend their position against a whole horde of savages! Sickness added to the terrors of their situation; yet they never felt in the least disheartened. They had fortunately an excellent commander in Mr Jehudi Ashmun; and two blacks of extraordinary intelligence, Lott Cary and Elijah Johnson, were of their number. To quote a small work of recent date: * 'Mr Ashmun, after taking a turn around the works, and reviewing his little force in the evening, thus addressed them with all the solemnity and impressiveness which their circumstances were calculated to inspire: "War is now inevitable," he said; "the safety of our property, our settlement, our families, our lives, depends under God upon your courage and firmness. Let every post and every individual be able to confide in the firm support of every other. Let every man act as if the whole defence depended upon his own single arm. May no coward disgrace our ranks! The cause is God's and our country's, and we may rely upon the blessing of Almighty God to succeed in our efforts. We are weak;

* Africa Redeemed; or the Means of her Relief illustrated by the Growth and Progress of Liberia. London: Nisbet. 1861. 12mo. Pp. 300.

He is strong. Trust in Him." A stern silence pervaded the little band: the men were marched to their posts, where they lay on their arms, with matches lighted, during the long watches of that anxious night. It wore away, and no enemy appeared.

'The next morning Mr Ashmun aroused himself from the languor of sickness to make a more thorough inspection of the fortifications. It was with deep anxiety as well as regret that he perceived the western quarter of the settlement could be easily approached by a narrow pathway, where was only a nine-pounder, and no stockade to defend it from assault. The eastern quarter was also exposed, but the station was well guarded, and a steep ledge of rocks made the approach both difficult and dangerous. From bed Mr Ashmun issued his orders with thoughtful vigilance. He commanded all the houses in the outskirts to be abandoned, and every family to sleep in the centre of the village. Guards of four men were posted one hundred yards in advance of each station during the night, and no man was to leave his post until sunrise. Another night passed, and another day arose on the anxious few. It was the Sabbath. A few hours' sleep were hastily snatched by the weary men, while earnest prayers went up from many a brave heart to the God of all mercy for his protecting providence. Divine service was holden at noon, and Lott Cary addressed his little church under the most tender and affecting circumstances. Perhaps it was their last Sabbath on earth; death in its most cruel form was hovering around them; another Sabbath's sun might witness their little colony given over to butchery and plunder, and every vestige of industry and Christianity for ever blotted out.

'At this moment one of the scouts came running in, with the news that the hostile army were crossing the Mesurado River, only a few miles above the settlement. By evening the whole body had encamped to the west, little less than half a mile distant. Silently and sternly did each man march to his post, and you could read on every face, "Give me victory, or give me death." Another night went by, and no war-yell broke the stillness of the forest. The day dawned. The western guard, owing to misapprehension, or inadvertence, or neglect of duty, left their posts at day-dawning instead of sun-rising, as the order ran, and consequently before the fresh guards were in readiness to take their places. At this unguarded moment the savages, who had stolen with silent step to the very verge of the clearing, and were watching with fiendish anxiety every movement of the little band, were now stirring for action. An immense body suddenly issued from the forest, fired, and then rushed forward with horrid yells upon the post. Taken by surprise, several of the men were killed, while the rest, driven from their cannon, without time to discharge it, fell back in haste and confusion. It is a fearful moment! If the savages press on, there is no time to rally, and all is lost! Instead of following up their advantages, they pause, and surround some houses in that direction, to plunder and destroy. Several women and children, who, in spite of orders to leave, remained in their houses, are now shrieking in the hands of a savage foe. Mr Ashmun rushed to the scene of action, and assisted by the determined boldness of Lott Cary, rallied the broken forces of the settlers. Two cannons were instantly brought into action, double-shotted with ball and grape. They did a rapid and fearful execution. The enemy began to recoil. Fear seized their ranks. The settlers, seeing their advantage, pushed forward, and regained the lost post. Directing their cannon to rake the whole enemy's line, every shot took effect; while Elijah Johnson, at the head of a few musketeers, passed around the enemy's flank, and increased their consternation. A savage yell echoed through the forest, filling every soul with horror. As

it died away, the horde fell back, and rapidly disappeared among the gloomy wilds. In thirty minutes the day is won! God be praised! At nine o'clock orders were issued to contract the lines, leaving out a fourth part of the houses, and surrounding the rest by a musket-proof stockade. As there was no safety until it was completed, the work was urged on with the utmost rapidity; for no one could tell when or where another attack might be made, and it was not until the next day that an hour could be spared for the burial of the dead.'

Such were the terrible struggles through which Liberia had to pass in order to obtain a footing in Africa. On the 2d of December the colonists experienced another and severer attack, which, however, they repelled after an hour and a half of hard fighting. The anniversary of this conflict is to this day the great holiday of Liberia, as the 4th of July is with the people of the United States. The troubles of the infant state were not yet ended; but from this time they gradually abated. Fresh colonists poured in; additional lands were bought; the native tribes were in time won over to see that industry and Christianity were things favourable to the happiness of mankind. In 1827 the early difficulties were past and nearly forgotten, and from that time there has been an almost unflinching course of prosperity. It should be mentioned, that associated with Liberia was an agency of the United States government, similar to the British establishment at Sierra Leone—namely, for the reception of blacks rescued by blockading vessels from the slavers. Such redeemed captives formed no small accession of strength to the colony.

In 1839, when the various settlements were consolidated under one government, Monrovia and Bassa Cove were two neat towns, with churches, schools, and libraries; there were other seven smaller towns. The people were in general well-behaved, temperance principles having great sway over them. They appreciated the freedom they enjoyed, and no inclination was felt to return to the United States. They owned five hundred thousand acres of rich land, where the finest vegetables and the most delicious fruits could be cultivated to any extent. There were four printing-presses and two newspapers. The colonists had after this period a war with a powerful chief called Gotamba—all on account of the slave-trade, the suppression of which was the object of their unceasing efforts. At length they succeeded in utterly overthrowing the power of this savage monarch, who was thenceforth an outcast in the region once ruled by the terror of his name. The feeling, we are told, then began extensively to prevail, that in Liberia, and in Liberia alone, were the people secure from the liability of being seized and sold into slavery. 'The idea cannot be more touchingly expressed than in the reply of a poor fellow, from the river Congo, on being asked if he did not wish to return to his own country: "No, no," said he; "if I go back to my country, they make me slave. I am here free; no one dare trouble me. I got my wife—my lands—my children learn book—all free—I am here a white man—me no go back."'

In 1847 Liberia announced itself to the world as a free and independent republic, in which character it has been recognised by the governments of America, Britain, France, and others—a just reward for the unspeakable amount of service it has rendered to humanity in its efforts for the suppression of the slave-trade. Its president, Joseph Roberts, originally a Virginian slave, visited England in the ensuing year, and received many marks of respect from the worthy of the human species. Since then we have continued to hear good accounts of the country. The people are said to be turning their attention more to cultivation than formerly—there being some ground of hope that Liberia may yet be called upon to take a prominent part in supplying

sugar, coffee, and cotton to the civilised nations which so largely demand them. Viewing it as the *point of the wedge* by which a Christian civilisation, if ever, is to be introduced into Central Africa, we accord it our sincerest good wishes, and most earnestly trust that its career of prosperity will meet with no further interruption.*

RAMBLES IN SEARCH OF WILD-FLOWERS.

JUNE.

I MUST once more beg my readers to travel with me while I lead them over as lovely ground as they will find on any part of the boasted coast of South Devon. Again we go up the pretty village a little way, and then turning to the left by the hotel, pass the end of Cliff Terrace, and at once the broad bright sea flashes on our sight, and by its side we pursue our way. It is all alive with fishing-boats, and glowing with azure reflected from the mighty vault above. The hill is very steep, and the heat, though tempered by a light breeze, is great, so that as I have plenty of time I take it leisurely, rather wishing, however, for 'Jack' and George to aid me on my way. But Jack could not climb stiles, several of which lay on my route, so I was reduced to the necessity of making my way on foot.

On my way I find the pretty sea sandwort (*Arenaria marina*), a little plant of the *N. O. Caryophyllææ* with long succulent leaves like the ficoides, and pretty pale lilac blossoms, and also the hemlock crane's-bill (*Eurodium cicutarium*), one of the *Geranaceæ*, exceedingly elegant, but so very fragile that I never could secure a specimen, the bright rose petals breaking off on the gentlest touch. From point to point as I ascended, I turned and delightedly gazed on the wide sea which lay below me, and the village nestling between the hills, and the cliffs beyond rising to the beetling crags above Landram; where the gulls, and cormorants, and choughs find capital shelves and ledges wholly inaccessible, and one above another on which to place their nests, whence their comical-looking young progeny peep down on the boats which pass below; and then again beyond these, a stretch of cliffs, the Peak above Sidmouth rising highest of all, with the island of Portland looming in the distance.

It is a fair scene, and long do I linger to study it. However, at last I reach the plain on the top, and here fresh objects of interest await me. The first thing I encounter is a man lying at full length on the ground, and diligently observing the sea through a telescope; a little farther on was another, and then a boy; and so

from point to point. Smugglers expected, thought I; but no, that cannot be, for the men have not the coast-guard dress. Suddenly one of the watchers raised his hands to his mouth so as to conduct the sound of his voice downwards, shouted, and received a reply from one of the many mackerel boats which were lying a little off shore, all ready manned, but so still and motionless that they seemed as if empty. In an instant the men were at their oars, and the large black-looking boat dashed off in the direction indicated, the crew pulling with all their might, and in another minute or two they had reached the spot where a school (probably a corruption of 'shoal') of mackerel was playing, and were engaged in dropping the seine. Presently another shout arose from another quarter of the cliff, and another boat started off in an opposite direction, with equal speed, and I found that the men and boys above were engaged in marking schools, their position on the heights giving them facilities for so doing not enjoyed by those in the boats. I was for some time at a loss to make out how they knew where the fish were, but I soon learned, and became quite expert at detecting them when the water was still: when the sea is at all rough, it is not so easy. When the smooth surface of the sea assumes a black look at some particular part, as if a breeze had just touched its waters, watch it well, and even with the naked eye you will perceive a sort of rippling movement. This is caused by the motion of the mackerel, which come up in shoals of many thousands, keeping together in a dense mass, and all busy in leaping about after the little fish which are its prey.

I have once or twice passed through one of these shoals in a boat, and the effect is then beautiful; for though at a distance, and from above, you only see the movement like a cloud on the water, or the light ruffle of a breeze, when close to them you see the brilliantly-coloured shining fish springing about by thousands in all directions, and glittering in the sunshine, as they rise for a moment, and then fall back again into the waves below. I once watched in a boat the drawing in of a seine, and followed it up to the shore. The water was so clear that we could see the fish, at first unconscious that they were enclosed in the net, and in their usual state; and then as the net neared the shore, and they became conscious of their misfortune, getting into a state of great alarm, and plunging and dashing about, in the vain effort to disentangle themselves. I was disappointed, however, to find that they had not made a good haul; for though there were fish of all sorts and sizes, and among them a quantity of fine red mullet, which we secured and carried home, they had missed the school of mackerel, and only enclosed a few of the stray ones from the outskirts of the main body. Several of the boats that I had been observing from the cliff have, however, been more successful, and I was amused by watching the drawing of the various seines, as I rested from time to time in my progress. Every one who happens to be at hand is pressed into the service of landing the net. A long line of people is formed at each end of the net, and reaching all up the beach, among whom I have often seen gentlemen with their coats off tugging away like the rest. Their efforts are regulated and made simultaneous by their voices—the same sounds being used as in raising the anchor. It sometimes happens that four or five seines are being drawn at once, and the measured sounds rising on the air from below have quite a musical effect as they reach the ear at my elevated position. Each individual, man, woman, and child, who lends a hand, gets a fish as his or her guerdon—that is, of course, when there are any in the net. But though I have heard of 30,000 being enclosed at one draught, it not unfrequently happens that the net comes in empty, or nearly so, greatly to

* A small, but we trust a transient cloud has lately passed over the fair fame of Liberia, in consequence of an assertion by Commander Forbes in his work, 'Dahomey and Dahomans,' that the traffic in slaves was practised by Liberian citizens. He has since repeated the assertion, saying: 'That the citizens of Liberia are guilty of buying and holding slaves, I had ocular demonstration; and I know personally two Liberian citizens,, sojourners at Cape Mount, who owned several slaves,' "in the general use of the term," but not in its legal sense as regards the treaties for the suppression of the slave-trade, as these slaves were what are termed domestic slaves or Pawns, and not intended for foreign slavery." We can imagine the citizens of Liberia taking natives into their employment or care, under bonds similar to those which appertain to apprentices in our own country, and this may be a very good arrangement for all parties—possibly an unavoidable one in the case. There may also be such a thing as a Liberian citizen clandestinely breaking the law against slavery, which is held forth as an article of the fundamental constitution of the state, just as there are British citizens breaking the laws against homicide and theft among ourselves. Till more exact information reaches us, we shall continue to trust that such and no more is the extent of the guilt implied by Commander Forbes.

the disappointment of those who have been reckoning their gains with eager anticipation.

And now I lose sight of the sea for a time, for my path lies across that wild bit of road where a landslip of former days has rent the cliff, and formed a deep ravine, down which rushes, in wet weather, and trickles in drier, a little moorland stream, which I cross by means of a rustic bridge which spans it, and reach the side of the heathy hill which is to bring me to 'the Beacon'; the highest point on that part of the coast, and one of the chief points of observation for the coast-guard. The gorse (*Ulex Europæus*) lies richly over the whole stretch of the hill, and a little of the purple heath begins to mix with it. The furze, gorse, or whin, all of which are synonymous terms, consists of but two species—*U. Europæus* and the dwarf furze (*U. nanus*)—the latter varying from the former only in being about a half smaller, and blowing later in the year. It is a papilionaceous flower, too well known to need much description; for its brilliant golden hue, and the rich fragrance, something like the smell of apricots, which it pours forth on the air, make it a general favourite. The young tops, which shoot after the old growth has been burnt, are occasionally eaten by cattle; and the whole plant, when cut and dried, makes a capital material for lighting fires or heating ovens; but wo to that baker or housemaid who ventures to handle it without a good pair of leathern gloves on! for most surely, like Duncan, his or her 'silver skin' will be 'laced with her golden blood;' for desperately sharp and penetrating are the spines wherewith it is armed.

I know nothing finer than the view from the top of the Beacon Cliff. The stretch of sea from Portland to Berry Head before me; to the right the beautiful river Exe, running by Mamhead and Powderham Castle in its way from the exquisite wooded country through which it passes on its way to the sea, and all round me, inland, are undulating hills—'brown with heath,' and cliffs

'That overtop the sea,
Covered by sea-gulls, ships, and skiffs,
That seem intent to be
Each on its separate track of life,
And each a mystery!'

But one of its greatest charms at this moment is, that it is near the point at which I descend to the thickets; so, leaving the higher ground, I go down a steep bit of rock, on which, later in the year, I shall find the elegant and rare little stonecrop (*Sedum Anglicum*) spreading its pink and white stars to the sunbeams; and crossing two sloping fields, find myself at the scene of action, and stop a moment before I pass through the gap in the hedge, and drop down the steep path, to gaze on the wealth of flowers before me. Thickets festooned with blue vetches (*V. cracca*), clematis (*Clematis vitelba*), or old man's beard, as it is called from the white wig-like appearance it assumes when in seed; rose and honeysuckles; the ground below one casket of vivid embroidery of all hues; and a calm, solitary-like beach of the whitest shingle filling the little space which lies between the thickets and the waves which sparkle at its edge. There is a little trickling stream of water, too, which courses down the face of the lofty rock, and adds life and beauty to the scene as it glitters in the sunlight. But amidst all this beauty, there is one object which especially attracts my eye; and that is a rose lying far below me, and in one of the most tangled parts of the thicket: it is superior in height to any around it, and presents a richer glow of deep rose colour than any I ever saw before growing wild. This, then, is to be the main object at which I aim; so shaping my course accordingly, I let myself down the steep, steep path in the best way I can, half-sliding and half-helping myself forward by the twigs which offer themselves to my

grasp, and soon find myself far down the cliff, and surrounded by as secluded and romantic a scene as painter's most imaginative pencil could portray—so very lovely, so dreamlike in its calm beauty, that often and often I have longed to find myself again seated in one of those precious little nooks, and feasting my eyes with the sweet scenes which there lay before me.

In my descent I found many varieties of the pea-tribe; but three among them were pre-eminent—the blue-tufted vetch (*Vicia cracca*); the elegant little rough-podded vetch (*Vicia bythinica*); and the wild everlasting-pea (*Lathyrus sylvestris*). The first of these, *Vicia cracca*, is well known: it is that lovely purplish blue vetch which throws its flexile branches so luxuriantly, forming a graceful and brilliant drapery on the hedges, and climbing on the lower branches of the trees, whence its clustering flowers, of a most lovely lilac hue, depend in festoons and long wreaths. The second, the *Vicia bythinica*, is rare, and exceedingly elegant. I found it on the right hand a little way down the cliff, where it grows in large patches. The flowers are stalked, and generally solitary, composed of a purple standard (the large upper petal of the five, which form the corolla); the wings (which are the two smaller side-petals); and the keel (a sort of boat-shaped member, which is formed by the other two, being white. The stem is about eighteen inches long, and lies prostrate; the legumes are erect; the leaflets four, lance-shaped, and minutely pointed. It is a graceful little flower, and very proud was I of finding it; but not nearly so proud as when, a little farther on, I discovered the narrow-leaved everlasting-pea (*Lathyrus sylvestris*), with its branched tendrils and sword-shaped leaves, twining over the thickets of rose and honeysuckle, and promising a fine show of blossom. Only a few corollas were as yet open; but I did not fail to visit the spot a fortnight later, and secure an abundant supply of it. The wild and garden everlasting-pea closely resemble each other: there is the same winged stem, the same arrangement of blossom; and the pod is similar, as is the tendril: the blossoms are smaller, of a deeper and duller rose colour, but variegated in the same way with blue and green; and the petals, like those of the cultivated species, lose their crimson entirely before they drop off and yield to the pod.

The heat on the face of this southern cliff is intense, what little air there is being wholly warded off by the huge rocks which encircle the little cliff in which the thickets lie; so that not a breath visits me, and my courage begins to flag, and a belief in the stories that I have heard of this cliff being a muster-place for multitudes of vipers begins to grow on me, so that misgivings as to the prudence of having undertaken the adventure arise to my mind. But there is the great rose-tree in view, and 'nothing venture nothing have' is a true proverb; so I sit down in a shady spot, and taking off my bonnet and handkerchief, refresh my heated hands by laving them in a little pool from the rivulet of which I have spoken. And then as my body cooled so my mind warmed anew to my adventure, and a fresh glimpse of the crimson-tinted prize before me sufficed to make me start up with renewed life and energy, and again set forward. So on I rushed, my eye fixed on the landmark which was to guide me in my approach, and in an instant I found myself to my ankles in a deep slushy mire, the startling coldness of which recalled me from my fit of enthusiasm.

What was to be done? The stream from which I had refreshed myself flowed through a strip of bog, narrow, indeed, but enough to sorely perplex me, for the mud was very deep and black, and it lay directly between me and the rose; however, by a roundabout way, I at last crossed it. But now I had lost sight of my object, nor could I guess which way to steer. By pushing on at random through the most tangled part of the 'bosky bourn,' I at last discovered it close

by me; and well was it worthy of the effort I had made to reach it. The unusual colour of the petals had first attracted me, but the leaves were now my wonder and delight. From every leaflet, as well as from the leaf-stalks, hung long silvery hairs; indeed it was so thickly coated with down in part that I fancied some of the fibres of the cotton-grass must have lodged on it; but none grew near, and I found on examination that they were the veritable growth of the tree itself. Then on gathering a branch, such a delicious odour was thrown out from it that I at once decided, though erroneously, that it was some kind of sweet-brier. The scent was quite of that character, and as powerful as that of any garden sweet-brier. It had evidently a running root, for many offsets had sprung up around, rivalling the parent tree in beauty and vigour—the leading shoots of all rising high, and arching somewhat at the upper part, and all armed with sharp and many prickles; those on the lower parts of the stem a little hooked, which tore my hands sadly, reminding me strongly of the inseparable union of *pain* with pleasure.

But only in the fair primeval time,
Without its piercing fence of bristly thorns,
The crimson rose its tender petals spread.
Then to the beauty of the lovely flower
Sharp spines were added, that our pains might still
Close to our pleasures lurk; and to our minds
Recall the memory of that former sin
From which (ah, well deserving!) was condemned
The earth to bring forth nettles, thorns, and briars.

So speaks Torquato Tasso in his quaint but interesting little book, 'Le sette Giornate del Mondo Creato.'

One characteristic mark of my rose was the exceedingly bristly calyx and flower-stalk, and another its doubly-serrated leaves. I presented it on my return to a friend who was an eminent botanist, and she being herself unable to decide on it, sent it to two or three of the first botanists in Devonshire without success. I was, however, afterwards told by a botanical friend, that it was the downy-leaved rose (*Rosa tomentosa*): probably it was a variety of that species; but the tribe of wild roses is so varied and difficult that few will undertake to pronounce decidedly on them. The pretty 'bonnet-leaved rose' (*Rosa spinipipina*), with its lemon-tinted petals, and mild, snuff-like fragrance, is to be found in a similar locality on the cliffs of Babbacombe, near Torquay; but I never found it at Salterton, though I should think it very likely to be good in some parts of those thickets. I had certainly had a most successful day's sport; and no sportsman ever bagged his game with more self-satisfaction than I. I packed up my rose, and my *Vicia bythinica*, and my specimen of lathyrus. It was quite enough to compensate for all my heat and fatigue, as well as for my plunge into the mud; and even the vipers were quite forgotten. But my day's exploits were not yet all achieved. On my way back I found the grandest specimens of the spotted palmata orchis (*O. maculata*) studding the strip of bog by the side of the rivulet, and mixed with it beautiful and abundant spotted spikes of the marsh horsetail (*Equisetum palustre*), in fruit; and then, in a thicket a little farther up, I alighted on a tuft of the pyramidal orchis (*O. pyramidalis*), its conical clusters of crimson blossom rising on tall footstalks above the tangled vegetation around, and pouring out a stream of sweetness. But alas! it is a true though a trite saying, that 'the downhill path is ever easier than the uphill'; and so I found it now; and I would not advise any delicate person to invade these solitudes, for it is indeed an arduous undertaking; and it was with much thankfulness that I found myself safely landed on the top, and threw myself at length on the greenward, to recover breath and strength for the long walk which yet lay before me. But things are generally worse in anticipation than in reality. The cool and

genial air which, denied to the lower ground, was abundantly wafted over the hill, and laden with all sweet and pure odours from the heath flowers, soon refreshed me; and then from time to time I met a friend who, like myself, loved to linger on the hill, and observe the exquisite hues of the amber and rose-tinted clouds which now hung on the pale green of the evening sky, and were reflected on the expanse of sea, where the mackerel boats still lingered, and where now many little fairy-like pleasure-boats were flitting about in gay profusion—a little rest and chat on such occasions much relieved the fatigue I felt, and sent me on my homeward path with renewed vigour. Then another variety of the pea-tribe awaited me at one of my resting-places—the pretty yellow lady's finger (*Anthylli valneraria*) which grows in dry pastures near the sea. This vetch has pinnated leaves, hairy underneath, with a terminal leaflet, and bears dense heads of yellow vetch-shaped flowers; the heads growing in pairs about a foot high. The blossoms, though generally yellow, are sometimes red or cream-coloured. The calyx and the flower-stalk are hairy, as are the large bracteas. Devonshire, Wales, and the south of Ireland seem to be its most usual localities, and some specimens of it formed a valuable addition to my already rich collection.

But even with all these pleasant things to allure me on my way, I was tired, and my spirits flagged long before I reached my home, so that I was glad to throw myself on the sympathy of a flower-loving friend, whom I found lingering on one of the seats half-way up the broad cliff, and to beguile the weary way with some chat. Exultingly did I display my treasures, and greatly did I find a little pleasant companionship aid me in conquering the rest of my journey; and not a little glad was I then, as I have often been since, that I lived not when

'The hardy chief upon the rugged rock
Washed by the sea, or on the gravelly bank
Thrown up by wintry torrents roaring loud,
Fearless of wrong, reposed his weary strength,'

but rather when I could enjoy that 'bliss reserved for happier day—the soft recumbency of outstretched limbs'; and truly I was glad that night to join the bard of Olney in his lay, and 'sing the sofa.'

EXTINCTION OF FIRE IN COAL-MINES.

SCIENCE has seldom been more usefully applied to ordinary purposes than in the recent remarkable case of fire-extinction in a Scottish coal-mine. An account of the case having appeared in various newspapers, we need do no more than refer to its more prominent features. A coal-mine of large extent, seven miles from Stirling, belonging to the Earl of Mansfield, had accidentally been set on fire about thirty years ago. The conflagration, which raged over twenty-six acres, was with difficulty kept from spreading by means of a surrounding wall, which was built at a cost of £16,000. This wall was maintained at an expense of about £200 per annum, and there was always a danger of the fire getting, by some accident, such as a fall of the roof, beyond its bounds, and spreading into extensive coal-fields below. All efforts to extinguish the fire having proved abortive, the proprietor called in the aid of Mr Goldsworthy Gurney, the inventor of the Bude light, and well known for his scientific acquirements.

Mr Gurney's plan of procedure was beautifully simple: it consisted in choking the fire with air deprived of its vital principle—oxygen. Arriving at the field of operation with all suitable assistance and appliances, he erected a furnace with a boiler to generate steam, near the mouth of a shaft leading down to the burning waste. With the boiler was connected an inch gas-pipe, sixty feet long, with a small cone

for the high-pressure steam-jet at the end of it. This jet was placed at the proper striking distance from a cylinder of sheet-iron, one foot in diameter, and nine inches in length. The cylinder was the passage between a coke furnace and the downcast shaft; and by a simple contrivance it was arranged that either common air or air from the furnace could be blown down the shaft at pleasure. Everything being prepared, the mouth of the shaft was covered with iron plates and clayed over, so as to render it air-tight, and the choke-damp was turned on. That extinguishing gas was made by passing the atmospheric air through the coke fire in the furnace, which deprived it of all its oxygen, or rather the oxygen combined with the carbon of the coke, and formed carbonic acid, which gas, in mixture with the nitrogen left, was forced through the furnace, along the iron cylinder, down the shaft, and into the burning waste; the quantity of coke consumed being a sufficiently accurate measure of the quantity of air passed.

After blowing in about 8,000,000 cubic feet of choke-damp, it was found that the pit must be full of this extinguishing air; for it was discovered to be flowing out at the mouth of an upcast shaft, and running along the ground. It thus ran along the ground, from being heavier than common air. A light held in it was extinguished. The mine was kept full of the choke-damp for three weeks; and it being then judged that the fire must be pretty well out, a stream of cold spray, resembling a thick Scottish mist, was driven down the shaft by the force of the steam-jet. This process Mr Gurney thought very important, as he considered the difficulty of cooling the immense magazine of heat after the fire was extinguished, to prevent reignition on the admission of fresh air, to be the most uncertain part of the whole experiment. That he could extinguish the fire he had no doubt whatever, but to cool down the waste against the existing conditions of non-conduction and non-radiation he considered far more difficult.

Mr Edward Cayley of Westminster, who assisted in the operation, proceeds to say, in his published account, that 'when the temperature of the mine was sufficiently reduced, as indicated by the thermometer, so as to leave no fear of reignition, fresh air was blown in by the spray-jet, so as to pass through the mine charged with water, in order to cool it enough to allow of its being entered. After a time the action of the jet was reversed, and the air drawn through the mine in a contrary direction, so drawing out the air we had blown in charged with mist; and we continued drawing out mist or vapour for several days, which shewed that it had filled every part of the waste, and had remained suspended. The temperature of the air that was drawn out gradually decreased at the rate of about six degrees a day. After about one month's operations, the downcast-shaft was uncovered and descended, and found to be of a temperature of 98 degrees. The waste was examined by Mr Mather, who reported that falls had taken place so as to leave no passage to enable us to go any distance into it. A shaft was then sunk into the middle of the burning waste at the point where the fire was supposed to have been most fierce at the commencement of our operations. The roof was here found to have fallen, so that it was impossible to enter. The fire, however, was extinct. Several bore-holes have been driven into the waste at different points, and no fire can be discovered; and this mighty volcano is extinct.

'The vast amount of property endangered (in this case of the value of near L.200,000), and the frequency of the occurrence of these kinds of accidents, give a great public interest to this operation. It is but two years ago that the proprietor of the Dalquarren coal-mine in Ayrshire lost in half an hour L.1200 a year by a fire breaking out in one of his pits, which led to the total abandonment of the seam in which it occurred. It has burned and destroyed the wood on the surface,

and extended over fourteen acres, but is now undergoing extinction by the same process, with every prospect of success.'

RESIGNING.

'Poor heart! what bitter words we speak
When God speaks of resigning!'

CHILDREN, that lay their pretty garlands by
Most lingeringly, yet with a patient will:
Sailors, that when th' o'erladen ship lies still,
Cast out her precious freight with veiled eye,
Riches for life exchanging solemnly,
Lest they should never reach the wished-for shore:
Thus we, oh Infinite! stand Thee before,
And lay down at Thy feet, without one sigh,
Each after each, our lovely things and rare—
Our close heart-jewels and our garlands fair.
Perhaps Thou knewest that the flowers would die,
And the long-voyaged boards be found all dust;
So take them, while unchanged. To Thee we trust
For incorruptible treasure;—Thou art just!

PANAMA.

A few weeks ago we gave a short account of a journey made across the Isthmus of Panama, terminating at Chagres, on the Gulf of Mexico; and occasion was taken to shew the superiority of this line over every other for ready communication between the Atlantic and Pacific. We are glad to see, from the communications of a correspondent of the 'Athenæum,' that the route above indicated is in the course of being adopted for a railway, and that the line is actually preparing. It is stated that the American company who have entered on the undertaking have chosen Navy Bay, near Chagres, for a terminus, in consequence of its preferable harbour. In going up the Chagres River, this writer mentions that the operations are visible at the distance of five miles. 'It was interesting, and stirring,' he says, 'to turn a reach of the wild solitary river, with dense forests on each side, and see all at once the red embankment of earth, the trucks running along full and empty, while workmen with spades and wheelbarrows, and a little steamer lying alongside the cutting with implements and rails lumbering her deck.' This intelligent writer, whose letters in the 'Athenæum,' April 26 and May 3, we recommend for perusal, is decided in his opinion, from personal observation, that the route selected is the best. The line of railway is to be open for traffic in two years; at the end of which period, by means of this and other channels now in progress, a flood of communication will be poured in this direction to and from the Pacific. The great line of transit for passengers and mails to Australia and New Zealand, China and adjacent regions, will be by Panama; and as steam will be largely employed, it is pleasing to know that there will be no lack of fuel at either end of the line.

HINDOO BEGGAR.

We once knew a beggar who had a house his own property, and supported two families by his profession, and two others who were money-lenders, and in both the lines carried on a prosperous business. All these three persons were blind, and took up begging as a way of gaining their livelihood, just as others do weaving or carpentering, or any other trade. They were looked on by all their neighbours as most respectable members of society, and none of the feelings we associate with the idea of pauper ever entered their minds. A Brahman who begs is considered a much more respectable character than one that keeps a shop or holds a plough.

THE RUDIMENTAL.

The state of society in which we live at present is commonly said to be *artificial*; but this, we suspect, is a misapplication of the term. If the present state of society be a natural development of powers and tendencies inherent in human nature, it is as natural as the condition of savagery itself. It would be as proper to say that the child is a production of nature and the man a production of art, when the fact is, that the one is the natural extension or *naturalisation* of the other. A more just view regards the savage as a human being in a rudimentary, and the civilised man as one in a comparatively complete or perfect state. The true peculiarity of the latter is, that, by social combination, by checking *here* and expanding there, by looking to the past and future as well as the present, he effects results far beyond what the savage man can even attempt; yet all he does in this way he does under impulses inherent in his nature, and the doings of the barbarian are in no respect different.

It is the province of history to unveil the process by which nature works upwards in the development of the human race; but the historian usually views his subject, so to speak, with civilised eyes, and thus, in estimating characters and actions, employs a criterion calculated only to confuse and mislead. Even in the spectacle now passing before us, in the Pacific, of savages growing visibly into civilised men, we find no materials for judging of the ordinary process of nature. The Sandwich Islands, which were discovered little more than threescore-and-ten years ago—the life of an individual—are now governed by a constitutional sovereign, with a house of nobles and a house of representatives; and the grand-daughters of those interesting savages who swam out to meet their European visitors, are described as elegantly dressed and ladylike women, sitting in their boudoirs at handsome writing-tables, with the Gospel before them, printed in their own language. Such is obviously the result of forcing, not of natural growth. 'Surrounded, coaxed, grappled by European policy,' as this humble pen has elsewhere said, 'the little barbarian state was in a perfect hotbed of civilisation, and grew like a mushroom bedded in manure.' But if an individual specimen of humanity could be found, perfect in mind, yet so organised as to be incapable of imitation, and thus shut up to a great extent in a world of its own, might we not obtain a view of at least the rudiments of what we call our nature? Still these, it must be confessed, would only be the rudiments of beings in our present stage of development; and in estimating them it would be necessary to make allowance for the fact, that con-

siderable differences of character naturally exist even in children of the same parents, reared under the same influences. We could only arrive, in short, at an approximation.

A specimen of this kind does actually exist. Many years ago we described to our readers the case of the interesting pupil of the Massachusetts Institution, Laura Bridgman, 'for whom the sun has no light, the air no sound, the flowers no colour and no smell,' and who of course is likewise destitute of speech. She is now recalled to our memory by being made the subject of a philosophical inquiry; and although this is confined to the rudiments of language traced in her vocal sounds, the paper* leads the thoughtful mind into a variety of other channels suggested but not explored by the author. Of these we shall presently notice one or two of the most interesting; but in the first place we shall describe in a few words the theory of language he advocates.

The first element of all phonetic language is the interjection. Every emotion, by quickening the respiration, causes an oppression of the chest; and this seeks relief in a way that gives birth to our sighs, laughter, moaning, and the exclamation of ah! eh! oh! which gradually become alas! *helas!* *ototoi!* &c. in different languages. Laura Bridgman, from whom most of Mr Lieber's illustrations are taken—since, being blind, deaf, and dumb, she could at first have no other teacher than nature—was accustomed to express great wonder by the sound *Ho-o-ph-ph!* 'and the actor of broad farce accompanies his assumption of stupid surprise with the same exclamation.' Such sounds, expressing any kind of emotion, are as natural to us as growing pale or wringing the hands; and they come even from refined and educated men with the passion and spontaneity of poor Laura's uncouth cries. When urged by her teacher to restrain these disagreeable sounds, she replied in expostulation: 'But I have very much voice—God gave me much voice;' although afterwards, when she felt an irresistible impulse, she shut herself up in her closet, and indulged 'in a surfeit of sounds;' or when deeply grieving, in unrestrained weeping. Laura, although obedient, gentle, modest, and affectionate, is so imperfectly organised that she is unable to hear her own voice, or to taste her own tears! We may add here, that the ordinary nod for affirmation and shake of the head for negation are as natural to her as the sounds in which she revels.

Mr Lieber's second class is the imitative word—such

* A Paper on the Vocal Sounds of Laura Bridgman, the Blind Deaf-Mute, at Boston; compared with the Elements of Phonetic Language. By Francis Lieber. Forming a portion of the Smithsonian Contributions to Knowledge.

as mutter, whiz, splash, &c. Out of the interjection there arises a third—such as the words formed from the sharp exhalation of the sound *f*, by which all men express disgust or contempt. This sound becomes *fie*, *fien* (to hate, in Low German), *fiend*, *pooh*, &c. It must be observed that even imitative words are not the same in all languages, but differ according to the genius of the people—the French, for instance, giving the sound of the drum by *rataplan*; the Germans by *brumberum*; and the English by *rubadub*. The fourth class proceeds from the imitative words—as, for instance, in the case of the English word *sly*, which, although it means cunning, is derived from the root of the word sliding. Another class resembles the interjectional. *Flash* is given as an example, expressing rapidly as well as brightness. Another class is illustrated by the English word *mum*! the interjection for silence, itself said to be founded on another interjection. ‘When we address erroneously a deaf-mute, or a person unable to hear and speak, and he desires to make us understand that he cannot speak, he compresses his lips and breathes strongly against the palate (so decidedly does thought or feeling animate the organs of respiration, and so phonetic or sound-sending is the nature of man.) This produces a humming sound—*um* or *mum*.’ Here we think our author is not so happy as usual. The interjection, *mum*! for silence, is obviously the sound produced when the flow of words is suddenly checked. *Ma*, or *mama* for mother, is found in nearly all languages, and is the first articulate cry of the child produced by the alternate opening and closing of the lips upon the simplest of all vowel sounds, a (pronounced as in *ha*.)

‘All other words are probably formed by composition, contraction, expansion, repeated transformation, and certain changes which gradually come to designate a general or peculiar relationship subsisting between certain ideas, or between the forms of words themselves in a purely grammatical point of view, the whole being essentially affected by the peculiar formative spirit with which a tribe shapes its words—whether, for instance, it is analytical; whether monosyllabic, as with the Chinese; or holophrastic, as with the American Indians. While these changes are going on with the formed words, their meaning alters according to the endless association of ideas, real or imagined affinities, the gradual expansion of the mind, the constant generalisation and abstraction, or a retrogressive degeneracy; and many other causes, mental and physical. It will have been observed that I have spoken only of the origin of words and of their phonetic formation. The meaning, which they acquire constitutes a different subject, which demands attention to all the laws of psychology—of the gradual progress of civilisation—to the laws of intellectual and philological degeneracy (for this has its laws, like all disintegration or corruption), to the changes of history—and, in short, to all the altering conditions and relations which take place within, under, and around man, individually and collectively, by tribes and nations, by concentration and tribal separation, by mixture, fusion, and by emigration—in politics, religion, the arts, and every advancement and debasement.’

Such is the theory of language which Mr Lieber studied in the hardly-articulate sounds of a being without the faculty of speech, and destitute of three out of the five senses! By the sense of touch alone is Laura capable of holding any communication with the external world, and her innate perceptions, therefore, form a most interesting subject for inquiry and reflection. In her we see the human mind in what may be said to resemble the interjectional state of language, and we are surprised to find that much of what we

have been accustomed to consider artificial in ourselves belongs in reality to nature.

A deaf-mute communicates by means of ocular signs, which have no phonetic value for him; but Laura, being blind as well as mute and deaf, traces her words on the palm of the hand of those she converses with. It seems hardly credible that her teacher, Dr Howe, could have triumphed over such extraordinary difficulties; but Laura does not merely converse in this manner—she writes letters to her friends, correct both in spelling and composition. Nature, however, was her first teacher, and in her language we recognise our own. ‘When Laura is astonished or amazed, she rounds and protrudes her lips, opens them, breathes strongly, spreads her arms, and turns her hands with extended fingers upwards, just as we do when wondering at something very uncommon. I have seen her biting her lips with an upward contraction of the facial muscles when roguishly listening at the account of some ludicrous mishap, precisely as lively persons among us would do.’ These phenomena she could never have seen or felt by the touch; they are therefore not imitative but instinctive. In like manner, when speaking of any one, she points to the spot where she had last conversed with him, as if he was there before her mind’s eye. ‘When Laura once spoke to me of her own crying, when a little child, she accompanied her words with a long face, drawing her fingers down the face, indicating the copious flow of tears; and when, on New-Year’s Day of 1844, she wished in her mind a happy new year to her benefactor Dr Howe, then in Europe, she involuntarily turned toward the east, and made with both her outstretched arms a waving and blessing motion.’ These motions are all spontaneous, like an expression passing unconsciously over the face. She has no purpose in making them, for she does not know what sight is, and does not know that they can be observed and interpreted by others.

Laura blushes and weeps, laughs and smiles, and stamps upon the ground in a transport of joy. ‘When I read your last letter to her, she laughed and clapped her hands.’ When she is merry, she often sings; and when she says a humorous thing, she is not satisfied if the person addressed does not laugh heartily. She once dreamed ‘that God had taken away her *breath* to heaven’—a common conception of the human soul, *breath* and *spirit* being synonymous in many languages.

We come now to Laura’s innate modesty, delicacy, or sense of what is commonly called propriety. The fact of such a feeling existing in her proves that it is natural, although it does not necessarily follow that it is primitive. There are many savage tribes that are disgusting in their habits, and few if any that are pleasing; but the nature of a human being would seem to change in new developments, like the perfume of a flower. If Laura had been the child of savages, delicacy would not perhaps have been one of her characteristics.

Her general goodness, amiability, and generosity are likewise natural in the present stage of being, and do not, we think, belong to her merely as an individual. The baseness of civilised man does not come from nature but from circumstance. In our waking dreams, when the mind is abstracted from the actually-existing world, none of us are bad: we are all charitable, generous, and high-minded; and even the deadliest revenge we act in imagination has a character of justice, however wild and stern. This is our nature, however different it may seem when we are in contact with the circumstances of life. There the agitation and unequal pressure overturn the equilibrium of our minds, our bad qualities assume the ascendancy, and our actions belie our thoughts. Such a process could not have taken place with Laura. This object of the most uniform and tender solicitude has never been

* We might almost say four out of the five, her sense of taste being very defective.

roused from her dream. Her mind is in its state of nature, where she breathes and feels only an atmosphere of love. Her thoughts have no injuries to dwell upon, but are full of benefactions. 'Laura said to me, in answer to a question why she uttered a certain sound rather than spelled the name: "I think of Janet's noise; many times when I think how she give me good things, I do not think to spell her name." And at another time, hearing her in the next room make the peculiar sound for Janet, I hastened to her, and asked her why she made it. She said, "Because I think how she do love me much; and I love her much."'

If Laura was not naturally amiable, instead of these beautiful and grateful feelings, her solitude would be disturbed by envy or acquisitiveness. Let it not be supposed, however, that this amiability partakes in the slightest degree of weakness: Laura, on the contrary, has much character, and her love of power and strong will are only controlled by her sense of right. This helpless being requires to know *why* she should do such a thing, and it is not till she is satisfied with the explanation that she obeys. Laura, moreover, is inclined to vanity, and to the use of grandiloquent expressions; but her teachers, who did not educate her as a philosophical experiment, but for her own sake, have taken care to keep out of her way everything that could strengthen her follies.

We have now to mention a curious and interesting circumstance connected with this imperfectly-organised being: it is her aesthetical feeling and sense of beauty. In former articles on this subject we endeavoured to explain Mr Hay's theory, in which he appears to demonstrate that in nature there is a science of beauty as well as of music, both being based on geometrical principles. The song of birds, and every other beautiful sound in nature, are composed on these principles; and so likewise is the Venus de Medici and every other beautiful object. Laura is a powerful evidence on this question. She cannot see: she is not seduced by colour or expression into calling that beauty which is merely loveliness; form is the only thing of which her senses can take cognisance; and of symmetry she judges with a severe and classical taste. The perception of beauty, therefore, is innate like the perception of harmony; and the blind, deaf, and dumb, who can form no conception of the blush that mantles on the cheek, or of the expression of the plastic lip or kindling eye, may be thrilled with the beauty of form. Let us add that Laura's sense of beauty is wholly distinct from her sense of loveliness. She is perfectly capable of love, although the sentiment is not inspired by colour or expression, but by manifestations of kind and generous feeling. This may receive some illustration from the beautiful picture given by Mr Lieber of the companionship of Laura. 'I have often seen her,' says he, 'seated by the side of a female friend, her left arm around the waist of her companion, and her right hand on the knee of the other, who was imprinting with rapidity on Laura's open hand what she was reading in a book before them. They thus formed the personification of the great achievement which Dr Howe has gained over appalling difficulties, never overcome, and scarcely attempted to be overcome, by any one before him—the picture of a communion of minds in spite of the enduring night and deathlike silence which enwraps poor Laura—an example of the victories in store for a sincere love of our neighbour, combined with sagacity, patience, resolute will, and what Locke calls, sound round-about common sense.'

'While I am writing these words,' says Mr Lieber, 'a tuneful mocking-bird is pouring out its melodious song before my window. Rich, and strong, and mellow as is the ever-varying music of this sprightliest of all singers of the forest compared to the feeble and untuned sounds which Laura utters in her isolated state, yet her sounds are symbols of far greater import. She,

even without hearing her own sounds, and with the crudest organs of utterance, yet has risen to the great idea of the Word. She wills to designate by sound. In her a mind is struggling to manifest itself, and to commune with mind, revealing a part of those elements which our Maker has ordained as the means to insure the development of humanity. The bird, with all its power of varied voice, remains for ever in mental singleness; Laura, in all her lasting darkness and stillness, and with that solitary thread which unites her with the world without—the sense of touch—still proves, in every movement of her mind and urgency of her soul, that she belongs to those beings who, each in a different indestructible individuality, are yet fashioned for a mutual life, for sacred reciprocal dependence and united efforts.'

We have now seen the complicated language in which civilised men clothe their thoughts traced to its emotional rudiments, and (with the limitation stated above) we have obtained a glimpse of the skeleton of the human character stripped of the tissues woven around it by circumstance in the progress of ages. At first view the spectacle may seem anything but flattering to our pride; but examined more closely, we think it is full of encouragement. It represents man as a progressive being, whose destinies are now only in the course of development; and it shews that he has his fate in a great measure in his own hands; the powers and capacities of thought and feeling with which he is furnished by nature being, like the talents of Scripture, the materials wherewithal he is to build up his fortune. What we have called Circumstance is not the 'unspiritual god' of Byron, 'whose touch turns hope to dust,' but something that may be fashioned and controlled by Education and Reflection—the teachers who work upon our spirits, instinct, like that of the gentle Laura, with good impulses in predominance over the evil. If the mind of this blind-deaf-mute be not a *lusus nature* as well as her organisation, we may collect from it that the impulse to vice and crime is received from without, and that we yield to it against the feelings and instinctive convictions within. We infer, besides, that innate qualities change in different stages of human development; and in our opinion, if history were only written and read under this conviction, it would no longer be the sealed book it is at present.

Having said so much about Laura, we may conclude by assuring our readers that this being,

'Sent into this breathing world not half made up,'

passes a life of tranquil happiness. Sometimes, when endeavouring to comprehend the mystic faculty of sight, she regrets her inability 'to see this beautiful world'; but she finds lovelier things within her—kindly thoughts, warm affections, and high and holy aspirations; and so the poor girl thanks God for her lot, and frequently exclaims: 'I am so happy that I have been created!'

THE HUNTER'S WIFE.

TOM COOPER was a fine specimen of the North American trapper. Slightly but powerfully made, with a hardy, weather-beaten, yet handsome face, strong, indefatigable, and a crack shot, he was admirably adapted for a hunter's life. For many years he knew not what it was to have a home, but lived like the beasts he hunted—wandering from one part of the country to another in pursuit of game. All who knew Tom were much surprised when he came, with a pretty young wife, to settle within three miles of a planter's farm. Many pitied the poor young creature, who would have to lead such a solitary life; whilst others said: 'If she was fool enough to marry him, it was her own look-out.' For nearly four months Tom remained at home, and em-

ployed his time in making the old hut he had fixed on for their residence more comfortable. He cleared and tilled a small spot of land around it, and Susan began to hope that for her sake he would settle down quietly as a squatter. But these visions of happiness were soon dispelled, for as soon as this work was finished he recommenced his old erratic mode of life, and was often absent for weeks together, leaving his wife alone, yet not unprotected, for since his marriage old Nero, a favourite hound, was always left at home as her guardian. He was a noble dog—a cross between the old Scottish deerhound and the bloodhound, and would hunt an Indian as well as a deer or bear, which Tom said, 'was a proof they Ingins was a sort o' warmint, or why should the brute beast take to hunt 'em, nat'ral like—him that took no notice o' white men?'

One clear, cold morning, about two years after their marriage, Susan was awakened by a loud crash, immediately succeeded by Nero's deep baying. She recollected that she had shut him in the house as usual the night before. Supposing he had winded some solitary wolf or bear prowling around the hut, and effected his escape, she took little notice of the circumstance; but a few moments after came a shrill wild cry, which made her blood run cold. To spring from her bed, throw on her clothes, and rush from the hut, was the work of a minute. She no longer doubted what the hound was in pursuit of. Fearful thoughts shot through her brain: she called wildly on Nero, and to her joy he came dashing through the thick underwood. As the dog drew nearer she saw that he galloped heavily, and carried in his mouth some large dark creature. Her brain reeled; she felt a cold and sickly shudder dart through her limbs. But Susan was a hunter's daughter, and all her life had been accustomed to witness scenes of danger and of horror, and in this school had learned to subdue the natural timidity of her character. With a powerful effort she recovered herself, just as Nero dropped at her feet a little Indian child, apparently between three and four years old. She bent down over him, but there was no sound or motion; she placed her hand on his little naked chest; the heart within had ceased to beat—he was dead! The deep marks of the dog's fangs were visible on the neck, but the body was unurtorn. Old Nero stood with his large bright eyes fixed on the face of his mistress, fawning on her, as if he expected to be praised for what he had done, and seemed to wonder why she looked so terrified. But Susan spurned him from her; and the fierce animal, who would have pulled down an Indian as he would a deer, crouched humbly at the young woman's feet. Susan carried the little body gently in her arms to the hut, and laid it on her own bed. Her first impulse was to seize a loaded rifle that hung over the fireplace, and shoot the hound; and yet she felt she could not do it, for in the lone life she led the faithful animal seemed like a dear and valued friend, who loved and watched over her, as if aware of the precious charge intrusted to him. She thought also of what her husband would say, when on his return he should find his old companion dead. Susan had never seen Tom roused. To her he had ever shewn nothing but kindness; yet she feared as well as loved him, for there was a fire in those dark eyes which told of deep, wild passions hidden in his breast, and she knew that the lives of a whole tribe of Indians would be light in the balance against that of his favourite hound.

Having securely fastened up Nero, Susan, with a heavy heart, proceeded to examine the ground around the hut. In several places she observed the impression of a small moccasined foot, but not a child's. The tracks were deeply marked, unlike the usual light, elastic tread of an Indian. From this circumstance Susan easily inferred that the woman had been carrying her child when attacked by the dog. There was nothing to shew why she had come so near the hut:

most probably the hopes of some petty plunder had been the inducement. Susan did not dare to wander far from home, fearing a band of Indians might be in the neighbourhood. She returned sorrowfully to the hut, and employed herself in blocking up the window, or rather the hole where the window had been, for the powerful hound had in his leap dashed out the entire frame, and shattered it to pieces. When this was finished, Susan dug a grave, and in it laid the little Indian boy. She made it close to the hut, for she could not bear that wolves should devour those delicate limbs, and she knew that there it would be safe. The next day Tom returned. He had been very unsuccessful, and intended setting out again in a few days in a different direction.

'Susan,' he said, when he had heard her sad story, 'I wish you'd lef' the child wheer the dog killed him. The squaw's high sartain to come back a-seekin' for the body, and 'tis a pity the poor crittur should be disappointed. Besides, the Ingins will be high sartain to put it down to us; whereas if so be as they'd found the body 'pon the spot, maybe they'd understand as 'twas an accident like, for they're unkinamon cunning warmint, though they a'nt got sense like Christians.'

'Why do you think the poor woman came here?' said Susan. 'I never knew an Indian squaw so near the hut before.'

She fancied a dark shadow flitted across her husband's brow. He made no reply; and on her repeating the question, said angrily—how should he know? 'Twas as well to ask for a bear's reasons as an Ingins's.

Tom only stayed at home long enough to mend the broken window, and plant a small spot of Indian corn, and then again set out, telling Susan not to expect him home in less than a month. 'If that squaw comes this way agin,' he said, 'as maybe she will, jist put out any broken victuals you've a-got for the poor crittur; though maybe she wont come, for they Ingins be onkinmon skeary.' Susan wondered at his taking an interest in the woman, and often thought of that dark look she had noticed, and of Tom's unwillingness to speak on the subject. She never knew that on his last hunting expedition, when hiding some skins which he intended to fetch on his return, he had observed an Indian watching him, and had shot him with as little mercy as he would have shewn a wolf. On Tom's return to the spot the body was gone; and in the soft damp soil was the mark of an Indian squaw's foot, and by its side a little child's. He was sorry then for the deed he had done: he thought of the grief of the poor widow, and how it would be possible for her to live until she could reach her tribe, who were far, far distant, at the foot of the Rocky Mountains; and now to feel that through his means, too, she had lost her child, put thoughts into his mind that had never before found a place there. He thought that one God had formed the Red Man as well as the White—of the souls of the many Indians hurried into eternity by his unerring rifle; and they perhaps were more fitted for their 'happy hunting-grounds' than he for the white man's heaven. In this state of mind, every word his wife had said to him seemed a reproach, and he was glad again to be alone in the forest with his rifle and his hounds.

The afternoon of the third day after Tom's departure, as Susan was sitting at work, she heard something scratching and whining at the door. Nero, who was by her side, evinced no signs of anger, but ran to the door, shewing his white teeth, as was his custom when pleased. Susan unbarred it, when to her astonishment the two deerhounds her husband had taken with him walked into the hut, looking weary and soiled. At first she thought Tom might have killed a deer not far from home, and had brought her a fresh supply of venison; but no one was there. She rushed from the hut, and soon, breathless and terrified, reached the squatter's cabin. John Wilton and his three sons were

just returned from the clearings, when Susan ran into their comfortable kitchen; her long black hair streaming on her shoulders, and her wild and bloodshot eyes, gave her the appearance of a maniac. In a few unconnected words she explained to them the cause of her terror, and implored them to set off immediately in search of her husband. It was in vain they told her of the uselessness of going at that time—of the impossibility of following a trail in the dark. She said she would go herself; she felt sure of finding him; and at last they were obliged to use force to prevent her leaving the house.

The next morning at daybreak Wilton and his two sons were mounted, and ready to set out, intending to take Nero with them; but nothing could induce him to leave his mistress: he resisted passively for some time, until one of the young men attempted to pass a rope round his neck, to drag him away: then his forbearance vanished; he sprang on his tormentor, threw him down, and would have strangled him if Susan had not been present. Finding it impossible to make Nero accompany them, they left without him, but had not proceeded many miles before he and his mistress were at their side. They begged Susan to return, told her of the hardships she must endure, and of the inconvenience she would be to them. It was of no avail; she had but one answer: 'I am a hunter's daughter, and a hunter's wife.' She told them that knowing how useful Nero would be to them in their search, she had secretly taken a horse and followed them.

The party rode first to Tom Cooper's hut, and there having dismounted, leading their horses through the forest, followed the trail, as only men long accustomed to a savage life can do. At night they lay on the ground, covered with their thick bear-skin cloaks: for Susan only they heaped up a bed of dried leaves; but she refused to occupy it, saying it was her duty to bear the same hardships they did. Ever since their departure she had shewn no sign of sorrow. Although slight and delicately formed, she never appeared fatigued; her whole soul was absorbed in one longing desire—to find her husband's body; for from the first she had abandoned the hope of ever again seeing him in life. This desire supported her through everything. Early the next morning they were again on the trail. About noon, as they were crossing a small brook, the hound suddenly dashed away from them, and was lost in the thicket. At first they fancied they might have crossed the track of a deer or wolf; but a long mournful howl soon told the sad truth, for not far from the brook lay the faithful dog on the dead body of his master, which was pierced to the heart by an Indian arrow.

The murderer had apparently been afraid to approach on account of the dogs, for the body was left as it had fallen—not even the rifle was gone. No sign of Indians could be discovered save one small footprint, which was instantly pronounced to be that of a squaw. Susan shewed no grief at the sight of the body; she maintained the same forced calmness, and seemed comforted that it was found. Old Wilton stayed with her to remove all that now remained of her darling husband, and his two sons again set out on the trail, which soon led them into the open prairie, where it was easily traced through the tall thick grass. They continued riding all that afternoon, and the next morning by daybreak were again on the track, which they followed to the banks of a wide but shallow stream. There they saw the remains of a fire. One of the brothers thrust his hand among the ashes, which were still warm. They crossed the river, and in the soft sand on the opposite bank saw again the print of small moccasined footsteps. Here they were at a loss; for the rank prairie grass had been consumed by one of those fearful fires so common in the prairies, and in its stead grew short sweet herbage, where even an Indian's eye could observe no trace. They were on the point of abandon-

ing the pursuit, when Richard, the younger of the two, called his brother's attention to Nero, who hail of his own accord left his mistress to accompany them, as if he now understood what they were about. The hound was trotting to and fro, with his nose to the ground, as if endeavouring to pick out a cold scent. Edward laughed at his brother, and pointed to the track of a deer that had come to drink at the river. At last he agreed to follow Nero, who was now cantering slowly across the prairie. The pace gradually increased, until, on a spot where the grass had grown more luxuriantly than elsewhere, Nero threw up his nose, gave a deep bay, and started off at so furious a pace, that although well mounted, they had great difficulty in keeping up with him. He soon brought them to the borders of another forest, where, finding it impossible to take their horses farther, they tethered them to a tree, and set off again on foot. They lost sight of the hound, but still from time to time heard his loud baying far away. At last they fancied it sounded nearer instead of becoming less distinct; and of this they were soon convinced. They still went on in the direction whence the sound proceeded, until they saw Nero sitting with his fore-paws against the trunk of a tree, no longer mouthing like a well-trained hound, but yelling like a fury. They looked up in the tree, but could see nothing; until at last Edward espied a large hollow about half way up the trunk. 'I was right, you see,' he said. 'After all, it's nothing but a bear; but we may as well shoot the brute that has given us so much trouble.'

They set to work immediately with their axes to fell the tree. It began to totter, when a dark object, they could not tell what in the dim twilight, crawled from its place of concealment to the extremity of a branch, and from thence sprang into the next tree. Snatching up their rifles, they both fired together; when, to their astonishment, instead of a bear, a young Indian squaw, with a wild yell, fell to the ground. They ran to the spot where she lay motionless, and carried her to the borders of the wood where they had that morning dismounted. Richard lifted her on his horse, and springing himself into the saddle, carried the almost lifeless body before him. The poor creature never spoke. Several times they stopped, thinking she was dead: her pulse only told the spirit had not flown from its earthly tenement. When they reached the river which had been crossed by them before, they washed the wounds, and sprinkled water on her face. This appeared to revive her; and when Richard again lifted her in his arms to place her on his horse, he fancied he heard her mutter in Iroquois one word—'revenged!' It was a strange sight, these two powerful men tending so carefully the being they had a few hours before sought to slay, and endeavouring to stanch the blood that flowed from wounds which they had made! Yet so it was. It would have appeared to them a sin to leave the Indian woman to die; yet they felt no remorse at having inflicted the wound, and doubtless would have been better pleased had it been mortal; but they would not have murdered a wounded enemy, even an Indian warrior, still less a squaw. The party continued their journey until midnight, when they stopped to rest their jaded horses. Having wrapped the squaw in their bearskins, they lay down themselves with no covering save the clothes they wore. They were in no want of provisions, as not knowing when they might return, they had taken a good supply of bread and dried venison, not wishing to lose any precious time in seeking food whilst on the trail. The brandy still remaining in their flasks they preserved for the use of their captive. The evening of the following day they reached the trapper's hut, where they were not a little surprised to find Susan. She told them that although John Wilton had begged her to live with them, she could not bear to leave the spot where everything reminded her of one to think

of whom was now her only consolation, and that whilst she had Nero, she feared nothing. They needed not to tell their mournful tale—Susan already understood it but too clearly. She begged them to leave the Indian woman with her. 'You have no one,' she said, 'to tend and watch her as I can do; besides, it is not right that I should lay such a burthen on you.' Although unwilling to impose on her the painful task of nursing her husband's murderess, they could not but allow that she was right; and seeing how earnestly she desired it, at last consented to leave the Indian woman with her.

For many long weeks Susan nursed her charge as tenderly as if she had been her sister. At first she lay almost motionless, and rarely spoke; then she grew delirious, and raved wildly. Susan fortunately could not understand what she said, but often turned shudderingly away when the Indian woman would strive to rise from her bed, and move her arms as if drawing a bow; or yell wildly, and cower in terror beneath the clothes, reacting in her delirium the fearful scenes through which she had passed. By degrees reason returned; she gradually got better, but seemed restless and unhappy, and could not bear the sight of Nero. The first proof of returning reason she had shewn was to shriek in terror when he once accidentally followed his mistress into the room where she lay. One morning Susan missed her; she searched around the hut, but she was gone, without having taken farewell of her kind benefactress.

A few years after Susan Cooper (no longer 'pretty Susan,' for time and grief had done their work) heard late one night a hurried knock, which was repeated several times before she could unfasten the door, each time more loudly than before. She called to ask who it was at that hour of the night. A few hurried words in Iroquois were the reply, and Susan congratulated herself on having spoken before unbarring the door. But on listening again, she distinctly heard the same voice say, 'Quick—quick!' and recognised it as the Indian woman's whom she had nursed. The door was instantly opened, when the squaw rushed into the hut, seized Susan by the arm, and made signs to her to come away. She was too much excited to remember then the few words of English she had picked up when living with the white woman. Expressing her meaning by gestures with a clearness peculiar to the Indians, she dragged rather than led Susan from the hut. They had just reached the edge of the forest when the wild yells of the Indians sounded in their ears. Having gone with Susan a little way into the forest her guide left her. For nearly four hours she lay there half-dead with cold and terror, not daring to move from her place of concealment. She saw the flames of the dwelling where so many lonely hours had been passed rising above the trees, and heard the shrill 'whoops' of the retiring Indians. Nero, who was lying by her side, suddenly rose and gave a low growl. Silently a dark figure came gliding among the trees directly to the spot where she lay. She gave herself up for lost; but it was the Indian woman who came to her, and dropped at her feet a bag of money, the remains of her late husband's savings. The grateful creature knew where it was kept; and whilst the Indians were busied examining the rifles and other objects more interesting to them, had carried it off unobserved. Waving her arm around to shew that all was now quiet, she pointed in the direction of Wilton's house, and was again lost among the trees.

Day was just breaking when Susan reached the squatter's cabin. Having heard the sad story, Wilton and two of his sons started immediately for the spot. Nothing was to be seen save a heap of ashes. The party had apparently consisted of only three or four Indians; but a powerful tribe being in the neighbourhood, they saw that it would be too hazardous to follow

them. From this time Susan lived with the Wiltons. She was as a daughter to the old man, and a sister to his sons, who often said: 'That, as far as they were concerned, the Indians had never done a kindlier action than in burning down Susan Cooper's hut.'

SIR JAMES BALFOUR'S COLLECTION OF MANUSCRIPTS.

SIR JAMES BALFOUR of Denmiln was a Scottish antiquary, and a collector of antiquities and manuscripts in the seventeenth century. He must not be confounded with that Sir James Balfour of the preceding century, who was concerned in the death of Cardinal Beaton, but was so little actuated by Protestant feeling that Knox, with his usual euphony, branded him as 'Blasphemous Balfour.' The subject of this notice was the son of a Fife laird with a numerous family, and he raised himself by his industry and capacity. The fertility of his race must have been such as no Scottish family possessions could have kept up with. If we believe Sir Robert Sibbald, the father of Sir James saw 300 of his descendants before he was committed to the earth, and a younger son, Sir Andrew, lived to see 600 descendants of his father alive. It is clear that the Balfours must have known how to make their own way in the world, and Sir James was not the only one of them who in his own generation was distinguished. He formed a literary acquaintance and association with many of the ablest Scotsmen of his day—such as Drummond of Hawthornden, Gordon of Straloch, Pont, Scott of Scottstarvet, author of 'the Staggering State of Scots Statesmen;' and the like. His own principal pursuits would scarcely have conferred literary distinction on him in later times—they were in the twin sciences of heraldry and genealogy—then enrolled among the noblest of sublunary studies. He obtained his reward by being appointed Lord Lyon King-at-Arms. It is rare that a person obtained at that period a high office through sheer study and zeal for his favourite subject, especially an office so intimately associated with the aristocracy of the country and their most cherished honours and distinctions. Their honours were, however, confided to true and zealous keeping. Doubtless many who have studied the arts which recommend them to the aristocracy have worked with their tongues in their cheeks, looking to the reward while they secretly despised the occupation. Balfour, however, it is evident, sincerely adored heraldry and genealogy. His sincerity is evinced by a long list of his works, left by his friend Sir Robert Sibbald, beginning thus:—'A Treatise of Surnames in General, but especially of those in Scotland;' 'A Treatise of the Order of the Thistle;' 'An Account of the Ceremonies used at the Coronation of King Charles I. at Holyrood House;' 'The Ceremonies used at the Coronation of King Charles II. at Scone, &c.;' 'An Account of the Coats of Armes borne by the Nobility and Gentry of Scotland.' Such is the mere commencement of a list which it would be a tiresome enough task to read through.

Balfour, in following out his genealogical researches, collected any letters and documents which might throw light on them. Though he wrote what he conceived to be a history of Scotland, and left annals of his own times, his chief service to the present day has been his collection of documents. Many of them have been doubtless dispersed; a circumstance to be regretted, if we may judge of their interest and value from those which have been preserved.

In the year 1698, the fragment of his collection of manuscripts remaining in the possession of Balfour's descendants was offered for sale: it was purchased by the Faculty of Advocates for £150. This was no considerable sum for that period in Scotland, that it is necessary to anticipate questions and say, that it was

sterling, not Scots money. The collection is still in the Advocates' Library, forming a range of flexible sheep-skin covered volumes, the state of which does credit to their binder; for after having been consulted and tossed about for more than a century and a half, they appear in very good condition.

The contents of these volumes are so varied and curious, that it would occupy a considerable space to give a mere cursory view of them. There are not, so far as we know, any memorials of those who have been solely known as literary men in the collection. Among the multitude of memorials of the later days of Queen Elizabeth and the reign of James, we question if there is a word to throw light on the dramatic literature of Shakspeare and his contemporaries; there is not even, we believe, any letter from the collector's own friend, the Scottish Petrarch. The collection contains, however, many letters by Lord Bacon; for Bacon was a peer and a lord chancellor, and therefore was illustrious according to the ideas of the Lyon King-at-arms. These letters may be found with others in the ample collection of all Bacon's known writings, edited by Basil Montagu. In looking over the originals, one is apt to smile on observing the pains taken to make the letters addressed to King James legible; while the others are written in the illustrious philosopher's ordinary careless manner. There is nothing wonderful, perhaps, in this difference taken by itself. It is a piece of natural etiquette to write distinctly to a person of superior rank. It is when the rank awarded to the two parties—Bacon and King James—by posterity is considered, that it becomes strange to look at the caligraphy of the author of the new philosophy.

There are specimens of King James's own sacred handwriting in Balfour's Collection: no doubt he thought them much more valuable than Bacon's. They are, in reality, very curious. It is seldom that the handwriting so closely represents the character. It is pedantic and feeble in the extreme; so much so, as to be very like the writing of a schoolboy just put into small text. He writes, to be sure, on some nervous matters of state: as, for instance, a paper called 'The true State of the Question whether Peacham's case be Treason or not.' Peacham was the poor clergyman who was condemned to death for having in his possession a sermon reflecting on King James: it was not preached, and it was never clear that he intended to preach and publish it. His condemnation was anxiously desired by the modern Solomon; and it was an object which created dissensions between the sterner supporters of the law and those judges who wished to favour the prerogative. King James took it as a personal matter, and it is perhaps to this that the extreme shakiness of his schoolboy text is to be attributed. He writes, in a more easy and manly way, in another letter in the same collection, which he concludes: 'From the castell of Croneburg, quhair we are drinking and drying our in the auld manner.'

This letter, which has been printed more than once, was addressed to Alexander Lyndsay of the Balcarras family, whom he afterwards made Lord Spynie. James was, when he wrote it, on the expedition to Denmark, which ended in his bringing home Queen Anne—an episode altogether out of the way of the ordinary routine and character of his history. The 'drinking and drying our' at Cronberg was probably deeper than any he had seen even in Scotland. The Danish prince came over with a train of jolly fellows to see his connection when he was king of the whole island of Britain. The drunkenness of the Danes, and the scenes exhibited at the court of Theobalds—never very decent—scandalised the British courtiers even of those days. Sir John Harrington's account of a masque given on that occasion has been often quoted, but is amusing enough to bear repetition. He says: 'The entertainment and show went forward; and most of the presenters went back-

ward, or fell down, wine did so occupy their upper chambers. Now did appear in rich dress Hope, Faith, and Charity: Hope did assay to speak, but wine rendered her endeavours so feeble, that she withdrew, and hoped the king would excuse her brevity. Faith was then all alone, for I am certain she was not joynt with good works, and left the court in a staggering condition. Charity came to the king's feet, and seemed to cover the multitude of sins her sisters had committed. In some sort she made obeysance, and brought giftes, but said she would return home again, as there was no gift which Heaven had not already given His Majesty. She then returned to Hope and Faith, who were both sick in the lower hall.'

This is not altogether inappropriate to the collection of papers left by Sir James Balfour, since there are among them many letters by King James's queen, Anne of Denmark. Historians have been puzzled about her character. On the whole, what is known of her is favourable; and any disagreeables have been explained by the view that she was a clever woman—at least clever enough to know the proprieties of her position, and be keenly alive to the ridiculous figure her husband sometimes cut—but not one with a powerful enough mind to command him and put him right. There are several autograph letters by this queen to her husband in Balfour's Collection. They are generally very pretty pieces of writing. The Italian hand, as it was called, was the favourite accomplishment of royalty in that age; and if one were judging from the mere lines and angles as they strike the eye, the queen's letters would be pronounced of a much later date than the other manuscripts in the collection, and might be attributed to a treasury clerk of George III.'s reign. Her letters are, on the whole, amusing. Here is one in which she is in anger; and it is blotted and interlined—a contrast to the formal neatness of the others:—

'Sir—What I have said to Sr Roger is trew—I could not but think it strange that any about your Matie durst presume to bring neer where your Matie is, or that had offered me such a publicke scorne, for honor gois befor lyfe, I must ever thing so. Humble kissing your Matie hands, I rest ever yours, ANNA R.'

In her anger she writes *thing* instead of *think*—a natural enough occurrence. There were many little quarrels between her and the king, of which we may find light traces in the annals of the period. She often complained, but in vain, of slights and affronts. James was generally disposed to look over these where it was only his queen who was concerned, and recommended her to make light of matters. It was so, for instance, when she wished him to visit upon Lord Marr his wife's pertinacity in retaining the custody of Prince Charles in spite of all court and state authorities. But though he was bitter enough when his own sacred person was assailed, he would not be at the trouble of quarrelling with any one for the sake of his queen.

Some of Queen Anne's letters in this Collection shew that she was a witty woman—as, for instance, this, which speaks for itself:—

'Your Matie's letter was wellcome to me. I have bine as glade of the faire wether as your self. The last part of your letter you have guessed right—that I wold laugh. Who wold not laugh both at the persons and the subject, but more at so well a chosen Mercurie between Mars and Venus? You knowe that womene can hardlie keepe counsaile. I humbly desire yr M to tell me how it is possible that I should keepe this secreete that have already tolde it, and shal tell it to as manie as I speak with. If I were a poete, I wold make a song of it, and sing it to the tune of Three foolles well mett. So kissing your hands, I rest yours, ANNA R.'

There is something that can only be expressed by the foreign word piquancy in the sight of this actual letter, written in its pretty, sharp, angular Italian, on

a small piece of paper, with the silk thread that bound it, and the little seal.

In the same thin volume there are other curious little memorials of King James and his family. All readers of history will remember how callously he was thought to have behaved to his daughter the queen of Bohemia. We might admire his character, if the interest of the people had prevented him from dragging those he governed into family quarrels; but in successively deserting his mother and his daughter, the world has judged that he thought entirely of himself. His daughter's letters have a pathetic, appealing tone. They are generally in French—one at least in Italian; but the following, in English, may be quoted as a fair specimen:—

'S^r—Being desirous by all the means I can to keepe myself still in your M^r remembrance, I would not let pass so good an occasion as this bearer returning for England to present my most humble dutie and service to your M^r, by these beseeching your M^r to continue me still in your gracious favour, it being the greatest comfort I have to think that your M^r doth vouchsafe to love and favour me, which I shall ever strive to deserve, in obeying with all humbleness whatsoever whatsoever your M^r is pleased to command her, who shall ever pray to God with all her hart for your M^r happiness, and that she may be ever worthy the title, S^r, of your M^r most humble and obedient daughter and servant,

ELIZABETH.

Heidelberg, this 20 of October.

Au Roy.

A letter from this queen of Bohemia's son to King James tells its own story only partially in print, since one would require to have before him the round, laboriously-constructed vowels and consonants, all put in a straight row, however, to feel how entirely boyish a production it is:—

'S^r—I kisse your hand. I would faine see yor matie. I can say Nominative hic haec hoc, and all 5 declensions, and a part of pronomen and a part of verbum. I have two horses alive, than can goe up my staires, a blacke horse and a chesnut horse. I pray God to bless your matie. Y^r maties obedient grand-child,

FREDERICK HENRY.

To the king.

Perhaps we may not unaptly associate with this a still more juvenile letter from a person of far more importance in our British world—the uncle of the Prince Palatine, and our Charles I. It, too, is addressed to King James, and it is brief, from the circumstance of the child's powers being evidently considerably exhausted in the effort:—

'SWEETE SWEETE FATHER—I learne to decline substantives and adjectives. Give me your blessing. I thank you for my best man. Your loving sone,

YORK.'

We cannot help coupling with this a letter to his brother, printed in Birche's Collection, in the same affectionate tone, but fuller and more kindly:—

'SWEET SWEET BROTHER—I thank you for your letter. I will keep it better than all my graith: and I will send my pistolles by Maister Newton. I will give anie thing I have to you, both heres and my bookes, and my pieces and my cross bowes, or any thing that you would haive. Good brother, loove me, and I shall ever loove and serve you. Your looving Brother to be commanded,

YORK.'

It would be unpleasant, after these affectionate effusions, to notice some later and disagreeable indications of the character of King Charles, contained in the documents to which we have been so amply referring;

and we shall close this article with a letter written when he was seventeen years old—half way between his happy childhood and his miserable maturity:—

'S^r—Not willing to omit anie occasion to wryte unto your M^r, I could not chuse but take hold of this occasion, by the going of S^r Hen Rich, to present my humble service unto your M^r. I am sorie for nothing but that I cannot be with your M^r at this tyme, both because I would be glad to wait upon you, and also to see the cuntrie whair I was borne, and the customes of it, so fearinge to trouble your M^r too muche with my ydel letter, I rest your M^r most humble and obedient sone and servant,

CHARLES.

Greenwich, the 28th of May 1617.

To the King's most excellent Majestic.

JAMES SMITH OF DEANSTON.

THE world is not so grateful to its practical workers as might be desirable. While enjoying the benefit of their labours, it amuses itself with singing the praises of the brave or brilliant; till in a few years the origin of an invention that has perhaps given a new impetus to civilisation may become the subject of doubt and controversy. The world, however, is hardly to be blamed for an indifference which arises from an almost necessary ignorance; for only a few are capable of comprehending the principles of the invention, and it is natural that the many should by and by forget their benefactor in the indulgence of the fruits of his labours. A man was taken away from us last year, however, whom we should be sorry to see included in the list of the great forgotten; for he was a strong-hearted, earnest, practical man—a man who saw clearly what he had to do in the world, and who went through his peculiar functions with untiring energy and zeal. This man was James Smith of Deanston; a place which he found a barren wilderness, and converted by his science into a model farm.

James Smith was born at Glasgow on the 3d of January 1789. His parents were of the respectable middle orders of society, his father being a merchant, and his mother the daughter of a landed proprietor—Mr James Buchanan of Carston. To the brother of his mother, Mr Archibald Buchanan, may be traced the direction and development of his nephew's mental powers; for with him the family resided after the elder Smith's death, and by him the boy was early familiarised with those studies which were destined to give the man his rank and place in the country. Mr Buchanan, indeed, was the originator of some of the most important of the inventions which his nephew afterwards carried to perfection and gave to the world. He had been a pupil of Arkwright, and is characterised by James Smith as 'a man of singular genius, sound judgment, and great application and perseverance.'

Young Smith's qualifications for the work that was before him were an active mind, a robust body, and a sound practical education. Having acquired some considerable knowledge of mathematics, chemistry, and mechanics, and finished his studies at the university of Glasgow, he was appointed, at the early age of eighteen, to the situation of manager of the Deanston Cotton Works, which his uncle had filled in early life before his connection with James Finlay and Co. He had subsequently been established at Ballindalloch, from whence he had now removed to the works at Catrine. The Deanston Works had now become the property of the eminent firm to which his uncle belonged, and of which another

of the partners was the distinguished merchant Kirkman Finlay; and at an age when young men of the day were usually employed in that peculiar department of industry known as the sowing of wild oats, James Smith found himself engaged in regenerating a vast business that had fallen into dilapidation, and in assembling, training, and controlling a body of about eleven hundred workpeople. For such duties he was fitted by the three qualifications we have mentioned, the absence of any one of which would have been fatal to his usefulness; and the same hardy, intelligent, and instructed youth, who prided with a reforming eye into the mysteries of the works, and regulated the education, manners, and morals of the human machines, engaged during his earlier years in athletic games with his men, followed the grouse over the moors, and shared liberally in the gaieties and socialities of the country side.

In No. 371 of the first series of this Journal will be found a comprehensive account of the works, and of the handsome village which sprang up in connection therewith, and under Mr Smith's direction, in this vale of the Teith, in the southern part of Perthshire. The manager was not satisfied with dictating the laws of the community. He knew every inhabitant by name, person, and character; visited at the houses; and by encouragement, reproof, or instruction, kept all to their duty. Drunkards were turned out as useless members, and other offenders were punished either by temporary banishment or entire expulsion. That everything was done in a wise and kindly spirit is demonstrated by the fact, that a turn-out of the men was unknown at the Deansston Works even in those years most distinguished for anarchy, and in spite of deputations sent by Glasgow to induce them to revolt. But Mr Smith did not merely secure the affections of his people, and elevate them in comfort and respectability—he likewise obtained from them, for the benefit of their employers, the maximum of work.

His inventions in tool-making and machinery, and his achievements in engineering, are important, although it is not on them his reputation rests. His self-acting mule, however, may be mentioned as being of special value. It was not tried first at Deansston, but came rapidly into general use, Mr Smith making a considerable sum by the patent. His contrivance, likewise, for completing and rendering secure a bridge, the foundations of which had been laid in a deep quagmire, spread his fame as an engineer far and wide; and the principle of the well-known Deansston salmon-ladder was applied to weirs of a similar kind in many other rivers. The ladder consists of two longitudinal beams placed along the sides of any large sloping channel in which the current is too strong to be overcome by the fish. Cross-beams or steps are fixed to those sides, and extend alternately about two-thirds of the distance across; thus forming pools or eddies, in which the salmon rest on their journey upwards.

Agriculture, however, is the field in which Mr Smith became best known; and in the midst of his multitudinous avocations he always found time for visiting the farms in his neighbourhood, and for gathering and exchanging knowledge on the subject of the cultivation of the earth. His machine for cutting corn attracted great attention; but practically it was found unfitted for general use, since its efficiency depended on the ground being perfectly level, without ridges or furrows. In land-draining and deep-working of the soil, however, he was eminently successful, and he demonstrated the correctness of his theories on these subjects by experiments on one of the most unpromising farms that could have been selected. 'The land,' says a writer in the 'Farmers' Magazine' of September 1846, 'consisted chiefly of the drifted debris of the old

red sandstone, and of various texture; some parts of the subsoil consisting of hard compact soil with stones, and some in the hollows of sandy clay, composed of the soil which had been washed for ages from the higher parts of the ground: the whole was very much interspersed with large boulder-stones, some of them very near the surface. The active soil was in general very thin, in many places not exceeding four inches. Most of the surface was studded with rushes and other water plants, whilst the higher knolls were covered with heath, furze, and broom.' This stubborn piece of land, consisting of about 200 acres, he determined in the first place to subject to thorough-drainage; believing, as he had been taught by his uncle, Mr Buchanan, that a dry condition of the soil is essential in our country to all good husbandry.

Few of our readers would be interested by a minute account of the system of drainage; but we may explain that the deep cross-drains formerly in use served only to carry off the under-water, while the furrow-drains of the flats of Stirlingshire dealt only with the rain-water. It was Mr Smith's idea to combine both; and he carried over the whole field in parallel lines a series of drains, about twenty feet apart, and thirty inches deep. This proved to be one of those great conceptions which, however simple in appearance, are destined to be the foundation of all improvement in the art to which they apply; but the invention of the subsoil-plough (described in No. 262, first series) was not only supplementary to this, but in itself a prodigious achievement. Common ploughing stirs only the active soil, which deep ploughing in the common way would deteriorate by intermixing with it the inactive subsoil. An instrument, however, which stirs the subsoil without bringing it to the surface would gradually, by the admission of air and water into the inert mass, confer upon it the principle of activity, without interfering in any way with the already active soil. On these two inventions—thorough-draining and subsoil-ploughing—all subsequent agricultural improvements rest; and by this means the wilderness we have described exhibited in a few years the cultivation of a garden, with an active soil no longer confined to a few inches, but sixteen inches in depth.

In 1831 Mr Smith published in a local channel a paper on Thorough-draining and Subsoil-ploughing, in which he states that by these means, together with an improved system of cultivation, the agriculturists of this country would be enabled to compete successfully with those of any other country in the world. It was not till the parliamentary inquiry, however, into the agricultural distress of 1834, that general attention was called to the subject. Mr Smith was examined by the committee; and the chairman, Mr Shaw Lefevre, in a letter to the Speaker of the House of Commons, referred to his evidence as pointing to the only plans likely to promote the general improvement of agriculture, and help the farmers out of their dilemma. Deansston now became a show-farm. A pilgrimage thither was essential to the aspiring agriculturist; and strangers from all parts of the British islands, the continent, and America, flocked to the vale of the Teith. Here they not only found a farm of 200 acres under garden culture, but a scene in other respects, as a journalist says, 'as pleasing to the eye as it was interesting to the intellect and the heart. The fields were conveniently laid off, kept very clean, and fenced generally with pretty white-thorn hedges, or when the situation required it, with ornamental belts of thriving plantations, which afforded protection to the crops and shelter to the flocks. Water for the supply of the fields and for the cattle was obtained from tanks fed by the drains, and pumped into the water-troughs by an ingenious but simple arrangement; and there was not an open ditch on the whole farm. The crops in the season were usually luxuriant—a thorough and uniform dryness having been

acquired over the whole surface by the new system of working.' Among the improved implements, the invention of Mr Smith, to be seen in operation, were the web-chain harrow and turn-wrist plough, by the latter of which his fields were worked in one uniform surface, without ridge or furrow. In manures and other matters connected with cultivation his experiments were incessant. In addition to all these avocations, this remarkable man was one of the most active magistrates of the county, and for more than twenty years he commanded a troop in the yeomanry cavalry of the district.

If strangers from all countries resorted to Deanston as to a school of agriculture, it may be supposed that the effect upon the neighbourhood was in the highest degree beneficial. The surrounding proprietors adopted many of the improvements of this model farm, and the result of well-drained fields, well-ordered farm-steadings, and well-manured soils, was earlier, heavier, and better crops. Then came the social triumphs of Mr Smith. Dinners were given in his honour, and speeches made in his praise, by the rich; while the poor not only esteemed him as a benefactor, but loved him as a friend. 'Those who have visited him,' says the same writer we have last quoted, 'will recollect with interest the lighted-up faces which constantly marked his appearance at the works—the smiles and curtsies which were showered upon him from cottage doors as he drove past—and, above all, the quick, bright glance of recognition and kindly nod with which such greetings were invariably acknowledged and responded to. No "monarch of all he surveyed" was ever, indeed, more thoroughly and deservedly popular; for none, while conferring the substantial benefits which attend industry, order, and mechanical ingenuity, has better understood and practised the kindly acts of lightening the burden of toil to the labourer by a due interposition of pleasure and amusement, and of softening its pain by the constant exercise of a humane and generous sympathy.' This intelligent writer adds—and he speaks from intimate personal knowledge—that the affectionate simplicity and cordiality of his domestic intercourse; 'the unwearied activity, industry, and energy of the man, with his many hearty sociable qualities; his cheerful, buoyant spirit, and keen relish of existence—all combined to make the very atmosphere in which he lived as healthful and bracing as it was genial and everyway delightful.'

The time, however, at length arrived when Mr Smith was to relinquish the management of the Deanston Works, and to remove from a place which he had such good reason to regard as a home. Much unnecessary mystery has been preserved by his friends upon this point, which appears to us to be perfectly simple. At the time it occurred, in 1842, the great company, of which he was the local manager, and which had liberally assisted him in all his experiments and improvements, had lost Mr Kirkman Finlay and Mr Archibald Buchanan; and the severe depression in the national trade, which had then continued for four or five years, rendered it proper for the surviving partners to devote themselves exclusively to their own business. Under such circumstances it may well be conceived that a person of such large and various views, and incessant activity of spirit, must have found himself gradually in a hampered position; and likewise that the company, while honouring the manager and loving the man, must have been compelled to see, as he did himself, that a separation was unavoidable. However this may be, the parting was as cordial as the companionship had been useful and agreeable; and Mr Smith, bidding adieu to his beautiful Deanston, went southward to 'fresh fields and pastures new.'

In Manchester chiefly the patents he had taken out for machinery were in operation; but London was the place naturally chosen by Mr Smith for his residence;

and here, in Whitehall Place, he took up his abode with his widowed sister, Mrs Buchanan, and her daughter. A letter he now addressed to Sir John Gladstone of Fasque, 'On the Profitable Employment and Comfortable Subsistence of the Increasing Population of Great Britain,' received wide circulation. The object, of course, was to illustrate the leading idea of his life—that an improved system of agriculture will double the produce of the land. Soon after his arrival in London he was appointed one of the Commissioners of Inquiry into the sanitary condition of large towns; and his labours suggested to him an idea, the working out of which is still one of the most interesting of all the problems that occupy the minds of projectors and engineers—the application of the waste sewerage waters to agricultural purposes. His plan was to convey the liquid manure to the necessary distance by means of pipes; and John Martin, the well-known artist, adopted this as an improvement on his magnificent scheme for cleaning and beautifying the Thames. Mr Smith's paper on the sewerage was published in the Appendix to the 'Report of the Health of Towns' Commission.'

Mr Smith now busied himself, and to some extent successfully, with introducing the Deanston system of agriculture into Ireland, and on various occasions he received the thanks of the Irish Agricultural Society. He was less successful in Sir James Matheson's island of Lewis, where he and the benevolent millionaire attempted—we fear in vain—to improve both the land and the savage population. During the railway mania he was fully occupied as an engineer in examining and estimating the land over which the lines were proposed to be carried. Simultaneously with all this labour his busy brain was teeming as usual with inventions. Plans for the 'dip of sheep' instead of smearing with tar, for improvements in farm-steadings, for housing cattle, for watering in droughts, for a new application of his salmon-ladder, and for many other objects, were flitting before him, some in embryo, and some completely formed.

He was now sixty-one. The quarry of his mind had only been worked deeply enough to shew that it was inexhaustible; and although not free from the partial ailments incidental to advancing years, his elasticity of mind seemed to promise him length of days to confer new benefits upon the world, and to reap the fruits of his genius. It is worth while to pause here, to observe what manner of man this was in his external appearance. His person hardly, if at all, reached the middle height. He was broad-chested and muscular, like one who could plant his foot upon the ground and receive the shocks of fortune like a rock; yet his quick, earnest eye and active limbs shewed that his strength was for advance, not resistance; that when obstacles came in his way he would not stand still in endurance, but push boldly through them. He was, in fine, a man who had a hopeful and courageous look, sanguine yet practical, whose very physical bulk seemed formed to contend with those material elements wherein lay his business on the earth.

Now, this man, at the time we have arrived at, proceeded to Scotland on his affairs; and, accompanied by his gentle and loving niece, went to visit his cousin, Mr Archibald Buchanan, at Kingencleugh in Ayrshire. Here he was in his element, and a score of years younger, no doubt, from the associations that rushed upon his heart. One day—it was in the evening of the 9th of June 1850—he went to bed apparently in his usual health. What waking dreams may have flitted before his eye ere he slept—what new ideas he may have caught at in their flight to garner them up for the morrow—what projects may have chased each other through his restless brain—it is impossible to tell: but that was his last night in the world. Without previous illness, and without pain, James Smith passed suddenly away, leaving behind him the memory

of a kindly, amiable, earnest man—a man who had performed zealously the work intrusted to him by God, and whose labours will long be felt in their influence upon the progress of the human kind.

THINGS TALKED OF IN LONDON.

June 1851.

THE Exhibition continues to be an absorbing subject in more ways than one, as most of our west-end shopkeepers have found out by the exiguity of their exchequer. In the supereminent attractions of the Crystal Palace minor considerations appear to be lost sight of: mercers complain that silks and satins remain unsold on their shelves in consequence of the grander display in Hyde Park; cabinetmakers mourn over undiminishing stocks of chairs and tables; chemists aver that pharmacy was never less in request; and empty benches are seen at theatres to a much greater extent than is agreeable to managers. How can it be otherwise? After spending their money and their time in the Great Exhibition people are too economical and too tired for any other pursuit of business or pleasure; and while the commissioners are taking their thousands daily, there is so much diverted from the pockets of retailers. Yet with all this flow towards the Industry of the Nations, our streets, at the time I write, are far from being overthronged, as was predicted. In such traffic as there is, however, the preponderance is decidedly westward, and shewn by the presence of well-dressed pedestrians on the footways, evidently more intent on pleasure than business. At present, expectation is uncommonly lively as to what the Whitsun holidays will produce. If realised we shall then have an overwhelming influx; but, as I hear, the railways cannot well bring more than twenty thousand per day.

I was at the Exhibition from the opening to the close on the third of the shilling days, when more than forty thousand people were in the building. What an extraordinary scene of life and movement they presented! To stand at the angle of the transept gallery and look down on the animated multitudes passing in all directions in the grand central avenue was in itself a spectacle of an astonishing character. The buzz of countless voices, the tread of thousands of feet on the cleanly-swept floors, the plash and play of the fountains, with an occasional distant blast from the organs, or a roudade on the pianos, formed a combination of sound overpowering in its vastness and continuity—such as impresses you with a feeling half of awe, that the idea of a concourse of nations has been fully realised, and makes it difficult to leave the contemplation for the more active business of examination in detail.

A general glance having been taken of the contents of this wonderful place in No. 387 of the Journal, I can only venture further upon a curiosity. No need now to go to Constantinople to see a Turkish bazaar, for here is one with its awning of striped purple and white, its stalls studded with stars and crescents, and displaying manufactures of such exquisite fabric and workmanship as to elicit an unqualified expression of surprise and admiration. I heard a lady lament that she had not been born in Turkey, that she might have worn the dainty and decorated slippers, the brilliant silks and brocades, and magnificent shawls which hung so temptingly around her. It was something to convince yourself by ocular demonstration of such taste and skill on the part of the Mussulmans. And yet when one looked at their rude agricultural implements placed by themselves in a corner, and contrasted them with the highly-wrought manufactures but a few feet away, it was scarcely possible not to draw a fair inference as to the social condition of the people by whom they were produced. There needed but little imagination to fancy yourself really on the shores of the

Bosphorus; for an old, gray-bearded Turk, wearing a fez and loose garments, sat grave and cross-legged in the midst of his goods, surrounded by three or four younger compatriots similarly attired.

The pendulum experiment is still a subject of discussion, still argued *pro* and *con* with different qualities of logic. Briefly stated, the question now stands thus: Professor Baden Powell gave his lecture on the phenomenon, as I told you in my last; but he admitted that the subject was 'beset with difficulties,' and but few of his audience were able to comprehend his reasoning. Mr Wheatstone endeavoured to explain the difficulty by something still more difficult—namely, a stretched spiral wire which, if made to vibrate vertically, changed the direction of its vibrations to horizontal immediately on the frame to which it was attached being turned half round. Then, again, the experiment has been tried at the Institution of Civil Engineers, and succeeded beautifully—too well, in fact, for the pendulum got through as much of its work in three-quarters of an hour as it ought to have done in six hours. Further, several of our most able mathematicians still deny *in toto* the hypothesis on which the whole argument is based—the immutability of the plane of vibration. If this be disproved the whole theory tumbles to the ground. We are promised, however, that the question shall be set at rest by a paper which will come before the Royal Society and the British Association. We are then to learn that neither the wire nor the bob of the pendulum rotates as hitherto supposed; that both are as independent in this respect as if suspended from a point unconnected with the earth; that the side of the bob facing the south at the commencement of the experiment will still face the south at the end. Those who may desire to try it will do well to remember one important fact—which is, that the longer the wire of the pendulum the more accurate will the results appear to come out, while in reality the error will be greater than with a short wire. Still, as a mathematical formula has now been constructed for the elimination of the error, an experiment even with a long wire, if faithfully conducted, may help towards a solution of the difficulty. Believers in the theory say, that before long the experiment will become a familiar one in class and lecture rooms.

Astronomers are talking about the total eclipse of the sun which is to occur on the 28th of July next, and preparations are being made by the sky-explorers in England, the United States, and other countries, for a trip to those parts of the continent in which the obscuration of the great luminary will be complete. A line drawn from Norway to the Caspian Sea will indicate the line of greatest darkness; and within this, at various points, it is hoped that many trustworthy observations of the interesting phenomenon will be obtained. The astronomer-royal has given a lecture on the subject at the Royal Institution, in which the appearances to be more especially noted, and the importance attaching to them, were stated with his usual ability. Another matter that has come before them is the name for the new planet recently discovered by Mr Hind; the one proposed satisfies both the ancient mythology and present philosophy. It is to be Irene (Peace), and represented in astronomical tables by the symbol of a dove with an olive-branch. Some people will be gratified at knowing that Mars meets with a counterpoise even among the planets. And last, concerning sidereal topics, is the fact that Leverrier, in an able memoir recently laid before the Académie, disputes the assumption that bolides or meteors are minor satellites of the earth, and disproves it by proof derived from the laws of mathematics and of motion.

To refer again to our Institute of Civil Engineers: they have been debating about railways in Egypt, and a canal across the Isthmus of Suez. Mr Robert Stephenson, who has lately paid a visit to the land of

the Pharaohs, talks about its engineering capabilities in a way which provokes much lively discussion among those who write M.I.C.E. after their names. Should it lead to the formation of one or the other line of travel, overland voyagers will not rebuke them for talking. As far as can be predicated, it seems pretty certain that if a speedy traverse of the American isthmus is to be effected, the African one will soon be rendered similarly available.

Apropos of America: the Royal Mail Company are about to add two new steamers to their New York and Boston line; and instead of sailing but twice a month as heretofore during the winter, will run a vessel weekly throughout the year: Holyhead to be their port. Storms and bad weather will have to give in to the spirit of enterprise. The project, too, for the grand Atlantic and Pacific Railway across the American continent is again talked of, on this as well as the other side of the ocean. Mr Whitney, the proposer of the scheme, offers, if Congress will grant him a strip of land sixty miles wide all across the country from Lake Michigan to the bay of San Francisco, to construct the line without the aid of money-grants from government or of public companies. His plan is, supposing the land made over, to lay down the first ten miles of road, which being done, will render the lands on either side valuable. These, for a breadth of fifteen miles, are then to be sold, and a second ten miles of rail laid down with the proceeds; and so on, selling and road-making, until the whole shall be complete, when the surplus lands and overplus of funds, if any, are to belong to the projector and his heirs. The line would commence at the southern extremity of Wisconsin, from whence to New York—more than 1000 miles—there is already abundant means of communication by railway and steamboat; which leaves 2030 miles of new road to be laid down. The first 800 miles comprise prairie grounds, well suited, it is said, for agricultural purposes; then come the slopes of the Rocky Mountains, and the descent into California. The project is certainly a magnificent one; and such is the pushing nature of the American character, that no doubt is entertained of the possibility of accomplishment by the means proposed. If carried out, it will form a short route to our Chinese and Australian possessions; and should Congress refuse their consent, it is thought that England might undertake the enterprise, as the possibility of constructing a railway from Quebec to Vancouver's Island has more than once been talked about.

Having on former occasions called your attention to what was doing in America in the matter of the electro-magnetic locomotion, I must now give you a few 'latest particulars,' which several of our engineers and mechanics regard with no little interest. Professor Page has been running an engine on a short line of railway from Washington to Bladensburg. The locomotive, as he states, with the battery fully charged, weighs ten and a half tons, and with a load of seven passengers he made it travel nineteen miles an hour, notwithstanding that, being new, the engine worked stiffly; that the battery-cells broke, owing to the imperfect nature of the clay of which they were composed; and that there was 'a want of insulation in the helices.' These are defects which time and experience will doubtless overcome: meanwhile we must remain content with the professor's account of the trial. He says: 'The running-time from Washington to Bladensburg was thirty-nine minutes.' We were stopped on the way five times, or we should have probably made the run in less than thirty minutes. Going and coming there were seven stops and three delays—that is, the engine was backed three times, but without entirely losing headway. It is a very important and interesting feature of this engine, which I demonstrated some years since, that the reversing power is greater than the propelling

power: it is nearly twice as great. When the engine is reversed, the magneto-electric induction is in favour of the battery-current, and augments its effects. The trouble growing out of the oscillating motion of the car can all be obviated by using rotary instead of reciprocating engines.'

To finish with a few miscellaneous items: the citizens of Boston, United States, now have the true time flashed to them daily at noon from the Cambridge observatory, four miles distant; by which the clocks of the city may be regulated, and the captains of vessels lying in the harbour may rate their chronometers.—A philosopher in Philadelphia, who has made a series of microscopical examinations of the hair of the ancient Peruvians, and compared it with that of the present races of Indians, comes to the conclusion that they all belong to the same species.—Electromagnetic clocks are about to be fixed in various parts of Berlin for the public service, the communications to be effected by means of the wires already stretched to signalise the breaking out of fires.—According to the returns of the Easter book-fair at Leipsic, 3684 works were printed in Germany in the preceding six months, and 1136 were in press—more than 800 a month; not too many, if knowledge be really increased.—Sir John Richardson is at work on a narrative of his overland journey in search of Sir John Franklin, from 1847 to 1849.—Mr Thackeray is adding to his literary fame by his able lectures on the English Humorists of the last century.—Manchester is about to erect a statue in honour of Dalton, the author of the atomic theory.—Mr Wyld's great globe exhibition is open.—And last, though not least, the twopenny admission-fee is abolished at St Paul's!

PASSAGES IN THE LIFE OF A DUTCH POET.

THE name of Wilhelm Bilderdyk is scarcely known beyond the boundaries of his own country; and yet those who are conversant with the Dutch language place him in a very high rank as a poet. The publication of his first poem, 'Elicus,' formed quite an era in the history of Dutch literature: it was speedily followed by a faithful and spirited translation of the 'Edipus' of Sophocles, and versions of other Greek writers. Besides his imaginative pursuits, he engaged with ardour in the study of geology, and almost rivalled Cuvier in his acquaintance with natural history. War and invasion, however, interrupted the labours of Bilderdyk. He quitted Holland, travelled through Germany, crossed over to England, and finally spent some time amongst the Scottish Highlands, where he employed himself in translating Ossian's poems into Dutch verse. He then went to the principality of Brunswick, and there composed a very extraordinary work, 'The Maladies of Wise Men'—a poem whose mild, lofty sublimity, unearthly interest, and grasp of gloomy thought, entitle it to rank with the 'Inferno' of Dante.

Bilderdyk at length was able to return to his country. Louis Napoleon, who then reigned at the Hague, chose him as his instructor in the Dutch language, and named him president of the second class in the Institute of Amsterdam. About this time he married a beautiful and talented girl, named Wilhelmina; and for several years they enjoyed together as perfect happiness as this world can give—she occupied in domestic and maternal duties, and he adding to his fame and fortune by the publication of several works. But at length death visited their dwelling, and removed within a brief space three lovely children. Their loss was commemorated by their mourning father in two poems—'Winter Flowers,' and 'The Farewell.' Not long afterwards, public misfortune came to aggravate his private sorrows. Louis Napoleon left Holland, and Bilderdyk took refuge at Groningen, where he stayed for some time, and then, rejecting a liberal offer of

employment made him by William of Orange, he set out for France, accompanied by his wife.

When they entered the diligence they found it occupied but by one person, a young female of mild and engaging appearance. No sooner did the heavy machine begin to move than she began to scream, and testified the most absurd degree of terror. Public carriages then were certainly far inferior, both in safety and accommodation, to those of modern times; yet the probable amount of danger to be apprehended did not by any means justify the excessive apprehension manifested by the fair traveller. On arriving at Brussels, the lady was so much overcome that she announced her intention of stopping some days in that city to recruit her strength before venturing again to encounter the perils of a diligence; and taking leave of Bilderdijk and his wife, she gratefully thanked the latter for the kind attention she had shewn her during the journey. The two Hollanders proceeded on their way to Paris, laughing heartily from time to time at the foolish cowardice of a woman who saw a precipice in every rut, and a certain overturn in every jolt of the wheels.

Arrived at their journey's end, the travellers took up their abode in a humble dwelling in the Rue Richelieu, and commenced with the utmost delight visiting all the wonderful things in Paris. Bilderdijk soon found himself completely in his element. He breakfasted with Cuvier at the Jardin des Plantes, passed his afternoon at the Bibliothèque Richelieu, dined in the Faubourg St Germain with Dr Alibert, and finished the evening at the play or the opera. One day he and his wife were given excellent places for witnessing the ascent in a balloon of a young woman, M^{me} Blanchard, whose reckless courage enabled her to undertake aerial voyages, despite the sad fate which befell Pilastre de Rosiers, her own husband, and several other aeronauts. Our Hollanders amused themselves for some time with watching the process of inflating the balloon, and following with their eyes the course of the tiny messenger-balloons sent up to ascertain the direction of the upper currents of wind. At length all is ready: the band strikes up a lively air, and M^{me} Blanchard, dressed in white and crowned with roses, appears holding a small, gay flag in her hand. With the most graceful composure she placed herself in the boat; the cords were loosed, and the courageous adventuress, borne rapidly upwards in her perilous vehicle, soon appeared like a dark spot in the sky.

When he returned to his lodging, Bilderdijk composed a poem in honour of the brave woman who adventured her life so boldly, rivaling the free birds of heaven in her flight, and beholding the stars face to face. Next morning he hastened to get his production printed; and without considering that M^{me} Blanchard most likely did not understand Dutch, he repaired to her lodgings with a copy of the poem in his hand, intending to ask permission to present it to her. He was courteously invited to enter the drawing-room, and there, to his great amusement, he found himself tête-à-tête with the silly, frightened lady, whose nervous tremors in the Brussels diligence had afforded so much amusement to him and his wife.

Surprised and disconcerted, he was beginning to apologise, when the lady interrupted him.

"Monsieur," she said, "you are not mistaken. I am M^{me} Blanchard. You see how possible it is for the same person to be cowardly in a coach and courageous in a balloon."

A good deal of conversation ensued; the poem was timidly offered, and graciously accepted; and the fair aeronaut accepted an invitation to dine that day with Bilderdijk and his wife.

In the course of the evening M^{me} Blanchard related to them some curious circumstances in her life. Her mother kept a humble wayside inn near La

Rochelle, while her father worked in the fields. One day a balloon descended near their door, and out of it was taken a man, severely but not dangerously bruised. Her parents received him with the utmost hospitality, and supplied him with all the comforts they could give. He had no money wherewith to repay them; but as he was about to depart, he remarked that the mistress of the house was very near her confinement, and he said: "Listen, and mark my words. Fortune cannot always desert me. In sixteen years, if alive, I will return hither. If the child who will soon be born to you should be a boy, I will then adopt him; if a girl, I will marry her!"

The worthy peasants laughed heartily at this strange method of paying a bill; and although they allowed their guest to depart, they certainly built very little on his promise. The aeronaut, however, kept his word; and at the end of sixteen years reappeared at the inn, then inhabited by only a fair young girl, very lately left an orphan. She willingly accepted Jean-Pierre Blanchard as a husband, and for a short time they lived happily together; but during an ascent which he made in Holland, he was seized with apoplexy, and fell to the ground from a height of sixty feet. The unhappy aeronaut was not killed on the spot, but lingered for some time in frightful torture, carefully and fondly attended by his wife, whom at length he left a young and penniless widow.

Marie Madeleine Blanchard, despite her natural timidity, resolved to adopt her husband's perilous profession. Pride and necessity combined do wonders; and not only did she succeed in maintaining perfect composure while in the air, but she also displayed wonderful presence of mind during times of danger. On one occasion she ascended in her balloon from Nantes, intending to come down at about four leagues from that town in what she believed to be a large meadow. While rapidly descending, the cordage of the balloon became entangled in the branches of a tree, and she found herself suspended over a vast green marsh, whose treacherous mud would infallibly engulf her. Drawn to the spot by her cries, several peasants came to her assistance, and with considerable difficulty and danger succeeded in placing her on terra firma.

On the day following the one on which she dined with M. and M^{me} Bilderdijk, M^{me} Blanchard left Paris, promising her two friends, as she bade them farewell, that she would soon return. Time passed on, however, and they heard nothing of her. They were preparing to return to Holland, when some of Bilderdijk's countrymen residing in Paris resolved to give him a banquet on the eve of his departure.

The entertainment took place at a celebrated restaurant situated at the angle formed by the Rue Caenat and the Rue de Provence. While enjoying themselves at table, the guests suddenly perceived the windows darkened by the passing of some large black object. With one accord they rose and ran out: a woman lay on the pavement, pale, crushed, and dead. Bilderdijk gave a cry—it was M^{me} Blanchard! In what a guise to meet her again! Encouraged by the constant impunity of her perilous ascensions the unhappy aeronaut (the word, I believe, has no feminine), finding a formidable rival in M^{lle} Garnerin, resolved to surpass her in daring by augmenting the risk of her aerial voyages. For this purpose she lighted up her balloon-car with coloured lamps, and carried with her a supply of fireworks. On the 6th of July 1819, she rose from amid a vast concourse of spectators. The balloon caught in one of the trees in the Champs-Élysées; but without regarding the angury, M^{me} Blanchard threw out ballast, and as she rose rapidly in the air she spilled a quantity of lighting spirits of wine, and then sent off rockets and Roman candles. Suddenly, with horror the mass of upturned eyes beheld the balloon take fire, one piercing shriek from above, mingled with the

affrighted cries of the crowd below, and then some object was seen to detach itself from the fiery globe. As it came near the earth, it was recognised as the body of the ill-fated *Mme Blanchard*.

Weeping and trembling, *Bilderdyk* aided in raising the disfigured corpse, and wrapped it up in the network of the balloon, which the hands still grasped firmly. The shock, acting on his excitable temperament, threw him into a dangerous illness, from which, however, he recovered, and returned to his native country. There he published an admirable treatise, 'The Theory of Vegetable Organisation,' and a poem, entitled 'The Destruction of the Primeval World.' A French critic has placed this latter work in the same rank with 'Paradise Lost,' and says: 'Old Milton has nothing finer, more energetic, or more vast in his immortal work.' An English critic, however, would probably scarcely concur in this judgment.

Bilderdyk died in the town of *Haarlem* on the 18th December 1831.

WHEN FISH ARE IN SEASON, AND WHY.

THE period for fish being in season is dependent upon laws as simple as they are universal. In land animals of the genus *mammalia*, the circumstances of the period of reproduction, and the care and attachment they manifest for their young, have the effect of so seriously deteriorating their structures, that a considerable time elapses before these regain their normal state. The cause of this in the land animals referred to is obvious, for the nourishment which had previously gone to support their own organism now goes to build up and nourish the structures of the young which are in process of development, and thus the mother becomes enfeebled, and her flesh unfitted for the use of man. With the fish of which we propose to treat, the reason for their being out of season is the same, although the circumstances are somewhat different. In the fish, the nourishment, besides supplying the necessary waste in the system of the female, goes at certain seasons to the production and growth of the innumerable ova with which she teems, and in the male to the development of the milt or soft roe, which is indispensable to the conversion of these ova into living creatures. And first of the salmon, the king of our river visitants:—

The proper abode of the salmon is the sea. It is ascertained that the seas around Great Britain, as well as those bordering on the north of Europe, and extending to Asia, form its true habitat. While in the highest state of health, however, the salmon is seldom if ever to be caught in the sea, even at the mouths of our great rivers. It is not until forced, by the instinctive necessity of spawning, to seek a place of safety, that it makes for fresh water; and when this occurs, the scales begin to lose their silvery lustre, the flesh to become soft and pale, and the marine insects which adhered to the bodies in the sea to drop off and die. Thus in addition to their inferior flavour when caught in our rivers, we have manifold evidence of the deterioration and comparatively unhealthy condition of the salmon at such seasons.

The salmon begins to ascend the rivers of Great Britain sooner or later in the spring or summer months. In rivers issuing from large lakes it is to be found early in spring, their waters having been sooner purified by deposition in the lakes. Rivers, again, swollen by melting snows in the spring months, are later, for the fish only begins to ascend them when the lake rivers are beginning to fail. Hence all the rivers in the north of Scotland are earlier than those in the south, or the English rivers. The Tay, the Earn, the Don, the Dee, and all the rivers to the north are earlier supplied with salmon than the Forth, the Esk, the

Tweed, the Humber, the Thames, and others farther south.

In ascending our rivers the salmon is exposed to numerous difficulties, which it must necessarily overcome before it reaches its destination. The strong currents, the shallow and exposed portions of the stream, the various falls which occur in our rivers, are all calculated to impair their strength, and add to that deterioration of structure which infallibly takes place in fresh water. The nervous and muscular energy thus expended enfeebles still more their diminished strength, and assists in increasing that deterioration which their exposure to fresh water had begun. Thus the salmon, by the time it reaches its spawning ground (a considerable way up some small stream), is much exhausted, and the subsequent exertion completes its deterioration, and reduces it to the mere skeleton of what it was when it first entered the mouth of the river. Thus, by the combined operation of these causes, a process of deterioration takes place in the fish from the first moment it enters the fresh water until it returns to the sea, where it speedily recovers its healthy appearance—its muscles increasing in size and strength, a deposition of fatty matter taking place, and its scales recovering their brilliant silvery lustre.

After the young fry reach the sea they are entirely lost sight of for about ten weeks; and we can only infer the rapidity of their growth during this short period, by their then returning to our rivers, weighing from 2½ to 4 pounds, when they are known as the grilse or salmon-peal. After remaining a short period in fresh water they lose their silvery lustre, their fins assuming a dusky appearance. In the ensuing winter most of these grilse spawn; after which they again return to the sea to recover their lost strength, and in the following year attain a weight of from 10 to 15 pounds, and are now first-year's salmon.

The period during which the salmon is in highest condition thus somewhat varies, according as it is early or late in ascending our streams; but, as a general fact, the fish is found in greatest perfection in the sea, at the mouths of our great rivers, before commencing its ascent. Previous to this, indeed, it is believed to be in a still higher state of health; but it is then in deep water, and not to be caught by any bait or process at present known. But, speaking generally, the salmon is finest in quality in February, March, April, May, and June, and continues tolerable during August and September. After it spawns it is thin and lank; its flesh pale and of an insipid flavour; and it is decidedly unwholesome as an article of food.

Cod.—The cod is exclusively an inhabitant of the sea, never even visiting fresh-water streams. It is found only in cold or temperate climates. It does not exist in the Mediterranean, or any other inland sea whose entrance is nearer to the equator than the fortieth degree. It appears, indeed, to be confined to the northern parts of the world, although few have been taken north of Iceland. It abounds, however, on the south and west coasts of that country, and likewise on the coasts of Great Britain and Norway. The cod uniformly keeps in deep water, and never approaches the shore excepting for the purpose of depositing its spawn. The general weight of the cod is from 14 to 40 pounds. The largest cod ever found on the coast of Great Britain was taken off Scarborough in 1755, and weighed 78 pounds; its length was 5 feet 8 inches, and its girth round the shoulders 5 feet. As indicated by the size of its mouth, stomach, and bowels, it is extremely voracious. It preys upon small fish of every description, and the herring and sprat are its favourite food. The cod, however, is far from particular in its choice, for it likewise feeds on worms, mollusca, and crustacea. From thirty to forty small crabs, about an inch and a half in breadth, have

been taken from its stomach, and the gastric juice of that organ is so strong that the shells and hardest portions are speedily dissolved by it.

The intense voracity of the cod renders it, even in deep water, a more easy prey to the fisherman than almost any other native of the deep. Hence it is that for considerably more than a century well-boats have been constructed for preserving alive fish, principally cod, caught at sea. The cod of commerce is fished, at a depth of from twenty-five to fifty fathoms, by lines and hooks baited with any of the smaller fish or crustaceans. Thus it is obtained for our markets in better season than the salmon, for it is caught while in the highest condition of health and strength, long before the muscular fibre of the fish is deteriorated by the development of the roe or milt. This fish is in best season as an article of food in the months of December, January, and February. It begins to deposit spawn in May and June, and for this purpose it frequently ascends the Forth, or other estuary, for upwards of twenty miles. From July to the end of October the large cod are observed to be long and thin, particularly those found on sand-banks or in shallow water, being then of very light colour, with flesh soft, unwholesome, and insipid to the taste.

Haddock.—The haddock likewise inhabits northern and temperate latitudes. It is found in great abundance all round the coasts of Great Britain and Ireland. The largest haddocks have been taken in the Bay of Dublin and neighbourhood. In all their migrations, they haunt together in immense shoals. They are not uniform in frequenting the same spot or locality, but change their haunts, not seemingly obeying any determinate law. This probably proceeds from a natural timidity of disposition, for the same characteristic is shown in their retreating into deep water during stormy or boisterous weather. During such seasons, indeed, the haddock conceals itself among the sea-weed at considerable depths, and is not then to be taken even with hooks baited with its most favourite food, but it returns immediately to its former haunts upon the subsiding of the storm. These habits of the haddock sufficiently account for the necessity of keeping this fish in salt-water tanks, in order to supply the demand at such seasons, and the consequent high prices which are then demanded for it in our markets.

This fish migrates in larger shoals than any other of the finny tribe, with the exception of the herring, and while in season is procured in great quantities. It begins to be in roe in the middle of November, and so continues until the end of January. During this period it approaches our coast in immense shoals to deposit its ova, when it is caught by our fishermen. It is consequently in best season about the commencement of this period. From the beginning of February, when its spawning is completed, till the end of May, this fish is slender in body, and thin-tailed, and is not wholesome as food. From the beginning of June till the end of September it retreats into deep water, where it gradually recruits and recovers its strength. The haddock ranges in weight from 1 to 14 pounds, for it has seldom or ever been found more than the latter weight. The haddock caught on the Irish coast is said to be the finest in flavour, and is highly appreciated by the epicure.

Whiting.—The whiting is a fish so closely assimilated in character and habits to the haddock, that, with the exception of not being so timid during stormy weather, the same general remarks apply to it. The whiting is in highest condition in November, December, January, and February; and during this period it is recommended to invalids, to whom flesh appears nauseous and sickening. The whiting, when about a foot long, is best adapted for the table; and while in season, is extremely delicate and nutritious, the fish feeding principally on the molluscs and crustaceans.

Halibut.—The halibut or holibut is exposed in large quantities in the markets of Great Britain; and from the large size of the fish, is sold by weight. It is only found in the northern seas, and is much used by the natives of Norway, Iceland, and Greenland. It is said by naturalists that holibut have been caught weighing nearly 500 pounds. In 1828 a holibut was exhibited in the Edinburgh market, measuring 7 feet 6 inches in length and 3 feet in breadth, and weighing 320 pounds. It had been caught on the coast of the Isle of Man, and was the largest specimen obtained in Britain within the memory of any person living. This fish resembles the turbot a good deal in flavour, and is even preferred to it by some persons. In the Firth of Forth it inhabits deep and rocky places. It is frequently taken of large size near Inchkeith, or the Bass Rock. It is in best condition in June and July, and continues in tolerably good season till about the end of February, when it spawns. During the following months of March and April it is unwholesome, and unfit for use.

Turbot.—The turbot is well known in our markets as one of the largest of our flat fishes, and is justly prized both for the delicacy of its flavour and its nutritious qualities. It is found in large shoals; and although not capricious in regard to its haunts, it appears, in frequenting certain localities, to be influenced mainly by the presence of the small fish on which it preys. Turbot are caught in considerable quantities on the coasts of Durham and Yorkshire with lines, in a similar manner to cod; but the most extensive turbot-fisheries are those of the Dutch, which commence about the end of March, and are pursued during the months of April and May, and continued till the middle of August, when the fishing is dropped for the year. The produce is principally transported in boats to the London market. From some peculiarity in its organisation, the muscular fibre of the turbot is not so much deteriorated during the growth of the milt and roe as in other fish, and if it could be caught, would be longer in season; but like most of the finny tribe, it is only to be procured when frequenting the coasts which it has selected as its favourite spawning-ground. The turbot spawns in August, after which it becomes feeble and is out of season; but it speedily recovers its strength, and retreats into deep water.

Sole.—The common sole, probably from the comparative smallness of its size, is seldom if ever caught by bait, but only by the trawling-net. Soles are found in great abundance on the coast of England, from Sussex to Devonshire, and on the shores of various counties of Ireland. The sole is full of roe in February, and approaches the shore to spawn about the end of that month or the beginning of March, after which it is extremely soft and watery, and unfit for use. After spawning the sole retreats into deep water, and in the course of six weeks or two months recovers its strength. Like the rest of the finny tribe, its flavour is finest when caught in deep water, before the roe or milt is much developed; but in consequence of being rather shy of bait of any kind, it is not then easily taken. This fish thrives in fresh water, and is there said to grow to double the size of the salt-water sole. It is in good season throughout the entire year, with the exception of the months of February, March, and April.

Skate.—Naturalists describe nine species of skate, all of which are easily to be recognised by their flat rhomboidal form and cartilaginous skeletons. The skate approaches our shores and spawns in the end of July or the beginning of August, after which it retires into deep water, and in the course of two months recovers its strength. As an article of food it is extremely rich and nutritious.

Herring.—The herring, the staple food of the poor in Scotland, and, when in high condition, no less a favourite with the rich, demands our special attention.

It was formerly held by Pennant and the older naturalists that the herring migrated to the coasts of Britain from the arctic seas; but more recent and accurate observation has discovered the fallacy of this notion, for few or none of the British species are to be found in the northern regions; and the fact that the herring frequents different parts of our shores at totally different seasons, has given rise to the belief that they merely retreat into deep water near our coasts, either for a more abundant supply of food, or for some other purpose connected with their recovery. Shoals of herring appear on the coast of Shetland about the middle of June, when the Dutch fishing commences. About the same period the herring appears in great quantities off the shores of Orkney and Caithness, and even so early as May a small species are caught off Thurso. These latter fish are full of roe and milt in August. Herrings in good season, too, are caught between the coasts of Caithness and Orkney about the end of December. Along the coasts of Sutherland, Inverness, and Argylishires, herrings appear in great shoals about June, and they approach close to the shores in July and August. On these coasts, too, winter herring make their appearance in November, and continue till about the middle of January. The lochs of the West Highlands of Scotland are all more or less frequented by the herring, but their appearance is far from regular or certain in any of them. They are caught about the beginning of June in Loch Fyne and Loch Long; and it is maintained by experienced fishermen that they may be caught in the former loch throughout the entire year. The herring of Loch Fyne have long been celebrated for their superior quality, occasioned, it is supposed, by the peculiarly nutritious description of their food. Off the rivers Tay and Forth, a few miles from the coast, the Dutch fishermen procure excellent herring in the months of July and August. In the Solway Firth the usual fishing time is in September. On the west side of the Isle of Man it commences about the beginning of September, and the fish are said to be equal in quality to those of Loch Fyne. The coasts of Ireland are visited by immense shoals.

The herring in fact visits the coasts of the islands or of the mainland of the north of Europe at all seasons of the year, and is not influenced by any great general law in its migrations other than that obeyed by the other fish we have mentioned. As a general fact, the herring is in best condition, as an article of food, when it is just approaching our coasts—probably four or five miles off. The roe and milt are only then in process of development, and have not subtracted largely from the strength of the muscular fibre. The healthy condition of the fish, indeed, is easily to be recognised from the firmness of its back and the moderate size of its belly, combined with the size and brilliancy of its scales; for when out of season, these scales drop off, and the body becomes pale and livid. Even after being cured, persons acquainted with herring select those having large and brilliant scales, being a uniform sign of the healthy condition of the creature when caught. The mere outward appearance indeed

of most of the finny tribe forms a clear index to their condition and state of health, and their consequent fitness for the use of man.

SONNET.

BY CALDER CAMPBELL.

Go seek for infant beauty in the field
Where summer flowers their morning fragrance fling;
The solitary gaffly on the wing
Welcomes it there; and with a shining shield
The bee salutes it, passing. Arums wild
Their scarlet sceptres, glowing 'midst a ring
Of spicy avens, that sweet tribute bring
To scent the couch where Nature, sun-revealed,
Cradleth it tenderly with gentle grace!
On mountain and by stream, in woods, where'er
The dewy steps of Flora man can trace,
Be sure that infant beauty nestles there:
The beauty that is born without a sound,
Starting in colours bright from every flower around!

BOWING IN ENGLAND.

In general the English approach ladies without bowing, with the hat thrust on the back of the head, almost down to the neck—and they unceremoniously offer their hand. This constitutes cordiality, and replaces our French politeness. On the part of the ladies this way of meeting is very pretty; but it is grossly rude on the part of the men—they have the air of accosting a lady as they would approach a horse. In relations with the vulgar, you lower yourself by being polite. If you take off your hat on entering a shop, you are served last, and with bad grace. Sometimes even you are taken for a beggar, and are turned out of doors, or have a penny offered you. That actually happened to me in a glove shop in Regent Street.—*Jules de Prémery*. [M. Jules de Prémery must be a very miserable-looking Frenchman; for we English are not charitable enough to give a penny to a bow unsupported by other symptoms of distress.]

VOLUME IX.

CONTENTS:—No. 65. Recent Decorative Art.—66. Alchemy and the Alchemists.—67. The Lost Laird: a Tale of '45.—68. German Poets and Poetry.—69. The Deserts of Africa.—70. Sigismund Temple: a Tale.—71. Electric Communications.—72. Fichte: a Biography.

THE EMIGRANT'S MANUAL

A complete MANUAL for EMIGRANTS, embracing the latest and most trustworthy information, is now in the course of publication. It will be issued in Parts, each referring to a distinct FIELD OF EMIGRATION.

Now Ready,

AUSTRALIA. 1s.—NEW ZEALAND, CAPE of GOOD HOPE, &c. 1s.—BRITISH AMERICA, and UNITED STATES of AMERICA. 1s.

The present number of the Journal completes the Fifteenth Volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

END OF FIFTEENTH VOLUME.

Printed and Published by W. and R. CHAMBERS, Edinburgh.

Sold by W. S. OAR, Amen Corner, London.

No. 392. NEW SERIES.

SATURDAY, JULY 5, 1851.

PRICE 1½d.

THE WOODS!

HALF a century ago there prevailed an extraordinary mania in Scotland for planting trees. The general bareness of the country, the want of shelter for newly-broken up lands, and the desire for ornamenting estates, offered a sufficient reason for going largely into arboriculture. But other causes conspired. Foreign timber was heavily taxed, and wood of even ordinary kinds was enormously expensive. Wood, therefore, as a growing crop, was believed to be one of the best sources of revenue to landed proprietors. Whether for these or other reasons, planting was carried prodigious lengths in various parts of the country, vastly to the improvement of the climate, and also of general amenity.

Considerable success in a commercial sense, as is well known, attended the efforts of the Duke of Athol and other great planters in the north; and this very success led to still wider enterprises. Thirty years ago—twenty years ago—planting was taken up by the lesser proprietors as a species of duty. It was the fashion to plant, and everybody planted. No sooner did a gentleman purchase an estate than he made arrangements with nurserymen to plant his hill sides, and these were in time duly laid out with fantastically-shaped clumps and belts of trees. Sir Walter Scott, on purchasing Abbotsford, went strongly into this craze for planting; and on various occasions in his writings—more particularly in an article in the 'Quarterly Review'—recommended every man who had the means and opportunity to set trees a-growing on his property. The result, we again say, is a great addition to the beauty of the country. Scotland has been made quite another thing by the operations of its gentlemen planters. We thank them for what they have done, and hope that their example will be followed in such situations as still stand in need of shelter and decoration.

While, however, commending the generally disinterested efforts of planters, the time seems to have come when it may be inquired how their enterprises are likely to prove profitable. One thing we distinctly admit: shelter from plantations has greatly advanced agriculture; and where this is the case a good and proper end has been gained. Beauty, also, is worth not a little. But beyond these two elements there is reason to believe that plantations in many situations will turn out a dead loss and cruel disappointment. In an excellent practical treatise on planting,* the author, a planter by profession, goes into some lengthy

statements to prove that trees, on a calculation of sixty or a hundred years, will be an infinitely more profitable crop than anything else, supposing that the land, for ordinary purposes, is worth only ten shillings an acre per annum. He mentions that in one place an acre of land produced L.144 in sixty years from trees, while it would have given only L.30 by renting it to a farmer. And so on with various other calculations. It does not escape the notice of this clever planter that the value of wood varies according as the locality may or may not be conveniently situated as regards a ready market for the sale of timber. But a leading and serious defect in his production consists in a want of deliberate advice on this important point. Some little acquaintanceship with trees in the way of property induces us to supply that species of admonition which the work in question, like most other treatises on planting, has unfortunately omitted.

In reading accounts of Canada and other uncleared parts of America, one is apt to be not a little surprised at the valuelessness of the growing timber. Forests of the finest tall trees are spoken of as a general nuisance. Magnificent trees which in this country we should look upon with respect, are viewed with detestation by settlers, and are felled, dragged together in heaps, and burned. The land, in fact, is not of any value till the timber is got rid of. In these extensive transatlantic regions trees are for the most part only of use for firewood, or for limited local purposes. It may be doubted whether, if taken altogether, they are worth so much as a single farthing each. A tree four feet thick worth no more than a farthing! A similar worthlessness of timber is experienced in Norway and Sweden. Travellers in these countries speak of the finest large trees being obtainable for a penny to threepence each—trees which in London would probably be sold for three or four pounds. This worthlessness of timber in Canada and in Norway of course arises from the want of local demand corresponding to the supply, and also the high cost of transit to suitable foreign markets. Overplanting has placed various parts of Scotland in a position, as respects trees, analogous to Canada and Norway. In those districts traversed by railways, or which are in the vicinity of large towns or seaports, or that are the centre of mining operations, wood of smaller and larger growth can be disposed of pretty readily at paying prices; but in situations possessing neither of these advantages, trees of any size are barely worth the cost of cutting down. Larch, fir, ash, elm, oak—all are nearly alike useless—positive encumbrances of the soil. We shall, for example, take a forest situated at the distance of about thirty miles inland from a large town. In that length of road there are six toll-bars, and the

* The Forester. A Treatise on the Planting and Management of Trees. By James Brown, Arncliffe. Blackwood: 1851.

cartage of a load of timber occupying two days will be not less than twenty shillings—a sum double the freight of a ton of goods by sea from St Petersburg. Now, when to this expense of land-carriage are added all other charges—planting, rearing, fencing, thinning, and cutting, with rent of land for a series of years—a price per load is made up which cannot in the circumstances be realised. A few well-grown and peculiar trees may be made to pay; but we are speaking of hundreds of acres of trees, not small quantities of a highly-recommendable quality. In short, the landowner who has a forest on his hands, and is cut off from the world by half-a-dozen toll-bars, may almost as well have as much extent of bare rock so far as direct profit is concerned.

That facts of this nature are beginning to be painfully felt by the sons and grandsons of many great planters there can be little doubt. The hallucination of covering lands with an unsaleable article is in the course of explosion, much to the distress of families who had reckoned on a different result. To aggravate the hardship of extensive tree-owners, ploughs, harrows, and some other agricultural implements which were formerly made of native hardwood, are now constructed of iron; so that, in the situations to which we refer, an ash or elm tree, unless of vast age and size, is probably of no more worth than one of fir or larch. Larches of moderate size for what are called 'country purposes'—that is, for making palings or hurdles—are indeed the only things saleable, but at prices which it seems a burlesque to mention.

In the course of last summer it was our fortune to cut down and try to sell sixty thousand trees in order to thin certain woods. Larches, Scots firs, and oaks were those principally cut. All were about twenty-five years' growth, and generally they were about the thickness of a man's leg; some smaller, where they had been too crowded. The larches were cut and peeled by contract for 27s. per 1000, and the Scots firs were cut for 15s. per 1000. The cost of cutting the sixty thousand was L.63, 3s.; and adding the charges for cartage, and all other expenses, the entire outlay was L.79, 5s.

How to dispose of the great loads of trees that lay scattered about among the woods was now the difficulty. There the fallen timber lay; and as we looked at the unconscious heaps of trees that lately bloomed in all their leafy honours, we felt as if we had done a cruel thing. However, the question was now how to sell these murdered innocents. Our factor, a shrewd man of business—every laird, great and small, must have his factor—recommended an auction. 'Roup them,' said he; 'public competition is the thing.' Accordingly, on a day in June, a roup was called by means of bills on every kirk door within a sphere of ten miles; post letters were despatched to farmers; and in the nearest burgh town the roup was announced by tuck of drum. The great day came, and with it a crowd of some thirty to forty persons at an appointed place among the woods. As we advanced to the spot the scene that presented itself was picturesque and original. Men in gray plaids were seated on mossy banks talking gravely of country matters; here and there lay a shepherd with his dog; two or three rural carpenters were inspecting the lots; and the factor's clerk, with book and pen in hand, and an inkhorn at his buttonhole, stood ready for business. At our approach the auctioneer, a tall, aged carle, who had gone through hundreds of things of the kind, called out that the roup was going to begin; and to shew that time was up, he appealed confidently to a silver watch as thick as a moderate-sized turnip.

All gathered themselves slowly to their legs; two or three mouths interchanged stumpy tobacco-pipes, and several noses took snuff. There was a general screwing up to business. At this important crisis, the auctioneer

winked, as a signal for us to have a private word with him.

Speaking low: 'Have you got the whisky?' said he. 'What whisky?'

'Why the whisky for the drams to be sure! Unless each get a dram and a biscuit, nothing will be done!'

'Never heard of such a thing,' said we; 'the people come to buy wood, not to drink.'

'Well, well, do as you like,' replied the rustic Nestor; 'only I can tell you this, that unless they are primed they won't fire. Many of them want to buy, but they have not got their blood up; and unless they have a little spirits to warm them, they will hardly be brought to give a bode. I ken the lads doon hereaway fine.'

A pretty fix this! We must either make the people half-tipsy, or see the loads of timber remain undisposed of.

To cut the difficulty, the onus of the transaction was thrown on the factor. He might do as he liked. The factor judged it prudent to supply 'refreshment'; some of the audience had come ten miles, and were a good deal tired—it was such a warm day, &c. A gilly was despatched for a few bottles of spirits and a batch of biscuits. The intelligence, loudly announced, that refreshments were coming, acted like magic. The master of the ceremonies lifted his staff, which acted the part of a hammer; and the bidding began. A shilling for that lot—eighteenpence—two shillings. Here a pause.

'What are you waiting on now, gentlemen—go on!' said the auctioneer coaxingly.

'You have not told if there is to be any discount for ready money,' cried a voice briskly.

'Oh, I forgot that!' was responded. 'There is to be sixpence a pound discount for cash.'

There was a murmur of approbation, and half-a-crown was twice bidden. 'Going to be a brisk sale,' whispered the auctioneer to us encouragingly. One lot after another was knocked down; and if little money was going, there was no deficiency of jokes.

'Aih, Charlie, that's a capital lot; ye'll hae nae want o' parritch sticks.'

'I wadna wonder, Tam, but ye're gaun to set up as a grand timber-merchant; there will be nae speaking to ye.'

'Come, Sandie,' cried the auctioneer, 'here's a lot for you; what d'ye say—a shilling to begin with?'

Sandie mustered courage to bid a shilling.

'I'll gie ye a ha'penny mair,' said a smart little man.

'Houts,' said the auctioneer, laughing heartily, 'keep that for the brode* the morn. We canna take a bode under a penny!'

From heap to heap the company straggled on, ascending the hill, and pausing ever and anon to chat, laugh, snuff, and do a little in the way of purchasing. At length having come to a steep part of the road, which was cut roughly through the woods, a discussion broke out on a matter of serious concern. Amidst the murmur of voices that reached us through the trees, one was heard louder than the rest: 'I'll no buy another bawbee's worth unless you lend me the slype.'

'Weel, weel, Charlie,' replied the old auctioneer soothingly, 'ye'll get the slype, I've warrant. Where is he himself?'

Perceiving that we were in request, we made our appearance.

'Will ye lend the slype?'

'The slype!—what's the slype?'

'The slype!—no to ken the slype, and you have got such a gude ane too!'

'Then be so good as explain what it is.'

'Losh, sir, no to understand what a slype is!'

There were looks of extreme surprise all round. We

* Collecting-dish for the poor at the church door.

were evidently held to be very small for our ignorance of woodland affairs. The factor, as in duty bound, came to the rescue.

'The slype,' said he, 'is a kind of sledge for bringing timber down from high places on the hills, where a cart with wheels could not be taken.'

'But I do not know that I have a slype.'

'Yes, you have one, lying somewhere in the farm-offices: shall I promise the loan of it?'

'By all means.'

Pacified respecting the slype, the sale went on, and came to a finish when still a good way from the top of the hill.

'A capital day's work this, sir,' said the auctioneer as we walked home part of the way with him. 'The clerk tells me the sales will come to at least twenty pound, and a' as gude as paid!'

Thereabouts, certainly, was the sum-total. There were one hundred and seventeen lots disposed of, consisting, in the aggregate, of twenty-three thousand trees, cut and ready for putting on cart or slype. After paying all expenses, the auction hardly realised the outlay. But the history of the affair is not ended. Despite the strong temptation of sixpence per pound discount, many of the lots were never claimed. The sale took place in the middle of June, and at Christmas the snow fell on various unremoved masses of timber—a melancholy exhibition. Of course, there might have been legal prosecution. But who would worry himself about such a trifle? The result, one way and another, satisfied the sentiment. Any more sales of wood by auction was out of the question; and the remainder of the lots were disposed of privately, some in barter, and others for money. The creditor side of the account was considered by the neighbourhood as exceedingly favourable. It showed for sale of wood and bark L.104, 14s. 6d.; leaving a balance over outlay of L.25, 9s. 6d., besides a lot of trees retained for home use.

'You may think yourself well off,' said every one. 'A penny a piece is considered a good price for trees in this quarter; and if you clear the expense of cutting them down and removing them, it is reckoned a great matter.'

A great matter certainly! Our eyes were opened to the grandeur of arboriculture. As many trees as a horse could draw on a cart were sold for eighteenpence, though, to do the transaction justice, some carloads brought as high as half-a-crown and three shillings. The whole affair was amusingly absurd, and presented a fine instance of the fiddle-faddery in which country gentlemen usually busy themselves. To see how far the joke might be carried, we invited a country carpenter, who wanted some good firs, to inspect a lot of upwards of forty years' growth. Capital tall sticks they were—not your thinnings. The offer which this judicious artisan made for them was—threepence to sixpence each. Had he cleared the two acres of land which they covered, we should probably have pocketed somewhere under thirty shillings. 'Why, you do not mean to say that threepence is all the worth of that tree?'

'Yes, I do,' replied the dealer in timber; 'there is little demand for wood of that kind here, and so much of it can be had that the prices going are a mere trifle.' Exit carpenter, and no sales.

Such are the experiences of a tree-owner, who should be glad to know what he is to do with a hundred and twenty acres of 'fine thriving timber' as ever graced an advertisement, or formed the subject of eulogy of a reporter on plantations. There are the trees, green, beautiful, the embellishment of the landscape. Growing and growing, year by year they are seen adding to their bulk, towering on the hill-sides, and offering a choice of solitary walks, deliciously fragrant and cool in the summer heats. But how is the primary and

continued cost of these fine woods to be realised? Thirty miles from a market! Six toll-bars! No sophistry, no poetry can get over these hard truths. Far beyond the legitimate demands for shelter and ornament, these pleasant woods, the pride of the wild, are valueless—a miserable consequence of that imprudent taste for planting which a number of years ago knew no limit but the power of satisfying it.

THE BARONESS PAFFZ.

We found ourselves doomed to the unpleasant task of lodging-hunting at a peculiarly unpropitious season for those who desired to combine economy with comfort and respectability; the monster Exhibition having extended its influence even to the quiet, far-away regions of Bloomsbury. The notifications of 'Apartments to let' in the windows of houses in the almost grass-grown streets of that once-fashionable locality far exceeded any number within the memory of 'the oldest inhabitant;' evincing how the anticipations of a harvest of unusual profit, arising from the expected influx of visitors to the metropolis, had contagiously spread. In the course of our progress we turned down a short blind street, where the houses were few, of moderate size, and more cheering outward aspect than the larger and dingier mansions of the immediate neighbourhood. We singled out one whose windows looked bright and clean, and where the announcement of accommodation was displayed on a small card in very minute characters—so minute as scarcely to be decipherable, and causing us to hesitate before making application at the door with the usual question, 'Can we view the apartments?' However, our doubts were speedily dispersed by a neat young handmaiden, who replied to our timid summons with considerable alacrity, inviting us to walk in, and to walk up to the first floor. This we did, and found ourselves in what was of course denominated the drawing-room—and what a tale we read by scrutinising the contents of the room! I turned over these sad pages of reality, which interested me much, for I saw we were in the abode of faded gentility, and not in a regular lodging-house. There was scant antique furniture, preserved with the utmost care and scrupulous cleanliness; touching attempts at decoration and embellishment; fine muslin curtains, so exquisitely darned that the darning stood in the stead of embroidery; and all presided over by an air of poverty indescribable, which made one shiver and feel cold at the bare idea of becoming an inmate. Ancient annuals were arranged methodically on a far more ancient table, and in the midst stood a splendid china bowl, evidently the pride and glory of the house. It was indeed a beautiful thing, while a solitary card reposed in its depths; and shall I confess that we had the curiosity and impertinence to peep at this bit of pasteboard? It had been so often cleaned with India-rubber that the printing was beginning to be obliterated; but still fairly distinguishable were the letters which formed the words—'Sir Thomas Crumpton, Crumpton Court.'

I had just returned this honoured relic to its painted nest, when an individual rapidly entered the apartment, talking in an equally rapid, excited manner, without once stopping to take breath, and requesting us to step down to the dining-room, 'where aunt was, and also a fire.' The individual alluded to, whose quick motions we now followed down the stairs we had so lately ascended, was a small-sized female, apparently about fifty years of age. She had remarkably fine dark eyes; but otherwise the pinched, meagre, not to say starved expression of her countenance, was absolutely painful to contemplate. Her dress was formed after the obsolete mode, when waists were just under the arm-pits, and four breadths of silk were reckoned the allowance

for a full, handsome skirt! But her headgear—what words may describe that? What fashion, what country, what age, did it belong to? She wore no covering save her own hair—and but few gray ones were perceptible—but that was all braided on the crown of the head, to resemble a basket containing flowers—artificial flowers of foreign and antique manufacture. The flowers were faded; the dress was darned, like the curtains; the gloves were mended—oh! so well and beautifully mended!—and yet the little, odd lady looked like a gentlewoman, and we felt convinced was one to all intents and purposes. She chattered without ceasing in the easiest, most confidential way, and introduced us to her aunt as if we had been familiar acquaintances instead of strangers seeking for London lodgings. The aunt was twin-sister in appearance to the niece, notwithstanding a score or so of years' seniority; the dining-room was twin-ghost of the drawing-room, save that there was no china bowl; but to make up for the deficiency, a spinet—surely 'the first of the spinets'—stood in one corner: it was open, too, as if recently played upon; and a mere handful of coal smouldered in the brightly-polished grate, originally of moderate dimensions, but confined into a handbreadth space by false back and sides. 'They wanted society; we were the very parties they desired to have'—flattering and embarrassing to us—they had never let lodgings before—of that we felt sure—but seeing so many others put up bills, and people of high respectability, too, they thought that, just by way of a little variety, they, too, would try their luck at letting part of their house—a house they had occupied for nearly thirty years.' Aunt and niece spoke both at the same time; and to our half-uttered sentence: 'We fear the apartments will not suit us,' exclaimed in chorus: 'We shall be delighted to receive you; we do not doubt your giving us unexceptionable references; pray do not apologise.' And we had some difficulty in making the poor old souls comprehend that we must search farther before coming to a decision; but when they named an exorbitant sum for even handsome rooms in a good situation, and named it, too, as a nominal rent, in the simplicity of their hearts—for the sake of being beneath an unexceptionable roof, exchanging a rather mysterious glance, we thought it better to plead inability to meet it than to wound their feelings. But it would not do: they had taken a fancy to us, it was clear, and, for the sake of such pleasant company, would meet us in any way! Aunt and niece whispered together for a few moments; and then the elder lady, drawing herself up majestically, said, with an air of dignity and importance that was never surpassed: 'Sir Thomas Crumpton of Crumpton Court is a relative, though a distant one, of ours, and I am the Baroness Paffz; though, since I lost my husband thirty years ago, and left a magnificent west-end mansion to reside here and bring up my orphan niece, I have dropped my proper title, and am recognised by the humble and commonplace one distinguishing the mass, even as plain Mrs Paffz.'

We bowed to the baroness, and really endeavoured to throw all the respect we could into our demeanour, for we had no inclination to laugh, or to hold up to derision the antiquated gentlewomen, who took our respectability on trust, and so unintentionally flattered our self-respect by their perfect confidence. We could not get away from them—we must see the bedrooms. Alas! for winter weather with those shreds of blankets, curtains, and carpets! We must test the powers of the 'instrument,' once so famed. They doted on music, and it should always be at our command. Then they told us how they had lived here for thirty years—thirty long years—visiting no one, and being visited by nobody—(yes; Sir Thomas Crumpton *had* called upon them once!)—seeing no sights save the high wall opposite, over which the apple blossoms towered now,

but hadn't when they first came; never walking out save to church—they were bad walkers: no books, no papers; only this old spinet to enliven their solitary, monotonous lives. They never hinted at poverty or privation, though the baroness sighed when she spoke of former splendours. At length we made our escape, though only by promising to call again, and give our final answer, 'Which we *do* hope—oh, so much!—may be in the affirmative!' exclaimed both aunt and niece, as we warmly shook hands, and parted like old friends. The great wonder to us was, how they had ever brought their minds to let lodgings; but as our acquaintance ripened, the facts of the case became more fully divulged.

The Baroness Paffz, in the days of her prosperity, had undertaken the sole charge of a destitute orphan nephew and niece, when she suddenly found herself a widow in reduced circumstances (the Baron Paffz held a diplomatic appointment, and lived up to his income.) Her nephew Desmond at that time was still at Harrow school. He was a high-spirited, handsome lad, equally the darling of his sister Clarissa and his fond aunt. Sir Thomas Crumpton was the only influential relative they had; but when reverse of circumstances overtook them, he looked coldly on those whose friendship he had formerly courted. However, he appropriated one of his freehold houses, at a low rent, for the use of the baroness and her niece: she would accept nothing more; nor was she aware, as we afterwards found, that twenty pounds a year were remitted by the niggardly baronet on the rent. He also articulated Desmond to a lawyer; and Desmond brought home every day to the blind, dull street his bright anticipations, and a spirit pining for freedom. Poor fellow! it could not last; he could not endure the confinement and monotony of such an existence, for he had been a pampered, spoiled boy, and promised by the deceased baron a commission in the Guards!

He at length disappeared; and months of torturing suspense passed over, the two lone women hearing nothing of his fate. They thought not of his selfishness in thus deserting them; they only pitied and loved him the more. Sir Thomas Crumpton was indignant in the extreme at young Desmond's conduct, and took this opportunity of 'washing his hands' of his poor connections. At length a letter came from the truant, and with trembling hands and streaming eyes the sister and aunt thankfully received it. Desmond was in India; he had worked his way thither on shipboard, and his prospects were brightening, after intense suffering and privation. Another letter, and another, each more hopeful and cheering than the last: Desmond was in the high road to fame and fortune, and in a few years would return to them a rich nabob! Fond dreams—illusive anticipations! The letters ceased, they heard no more, and for twenty-three years these patient souls had existed on hope. 'Desmond *must* be still alive.' No tidings could they gather of his death in those distant regions; still he would return to them, wealthy and powerful—for what were twenty-three years after all? Clarissa was still a girl to Aunt Paffz, and the baroness lived on memories of past happiness. Changes went on around them, but there was no change in them. A room was kept in constant readiness for Desmond's return, but the moth and decay *will* make themselves heard; and how fervently they wished for means to redecorate that chamber. The same idea had struck them both, though it was a long while ere they found courage to communicate it to each other—the idea of imitating the example of their neighbours, and putting up a bill signifying that part of their house was to let. The Baroness Paffz was the landlady, Sir Thomas Crumpton was their relative, and select and aristocratic must be the inmates they received! The emendation arising from this proceeding was to be entirely

devoted to the reparation and embellishment of Desmond's chamber—Desmond, the anxiously and daily looked for!

Clarissa still warbles the songs which Desmond admired when he was a boy, for he will like to hear them again, she says; she wears the headdress in which then, he proudly said, his pretty darling sister looked still prettier. Each knock at the door causes her to dart to the window and peep through the blinds to ascertain who it is; and often she says to Aunt Puff, that she almost trusts their boy may not come just at this juncture, as he mightn't like to see the ticket up, and she would like to have his room fresh and nicely done up for him.

Poor things! my heart throbs in sympathy as I listen to their oft-repeated anticipations, for we are great friends, and I often refresh myself by going to see these out-of-the-world women. In their case, hope deferred has not made the heart sick—not unhealthy, or feverish, or even impatient. They are inured to waiting; they literally feed on hope; and when it is withdrawn, they will speedily fade and wither doubtless. But will it ever be withdrawn? Will they not depart this life with the hope yet warm in their yearning hearts that Desmond and they are surely about to meet again? It has sustained and cheered them in adversity, and who would wish to destroy the innocent hallucination? It is not, indeed, impossible—such things have been heard of—and Desmond, after a twenty-three years' silence, may turn up! We have never regretted our labours of lodging-hunting, since they brought us into contact with these interesting old ladies; no other visitors penetrated so far as the retired street where they reside; and after a few weeks they decided on taking the modest card of 'apartments to let' from the casement, lest Desmond should return. When he does, we will promise to add a little supplement to this romance of real life; and, in the meantime, may we, under hopes deferred, prove as patient, faithful, and resigned!

THE PALACE AT WESTMINSTER.

'I CANNOT comprehend it,' exclaimed Monsieur Vieuxtemps, a French gentleman standing near the Crystal Palace on the 1st of May, as soon as the subsidence of the cheers which greeted the Queen permitted him to be heard. 'I am told—and I can readily believe it—that there are a million of human beings in and about this glorious park, and among them exiles, refugees, visitors of every nation and degree, and yet there are certainly not more than three or four hundred soldiers to be seen! Where shall I find the secret of this multitudinous homogeneity—this grave enthusiasm—this order without force—this freedom without licence—this antique, hearty, but unservile loyalty; where seek the *mot d'énigme* of this marvellous riddle?'

As I happened to be one of a small group thus indirectly addressed, I said: 'You must not forget, Monsieur Vieuxtemps, that there is a reverse side to this gay picture—profound shadows, but the gloomier for the brilliant lights with which they are contrasted. In yon vast, half-deserted city, which has poured forth this multitude of well-dressed holiday-makers, there are hundreds of wretched homes and pining hearts!—'

'Of course—of course,' broke in the impatient Frenchman; 'that must be the case, I imagine, in all competitive societies; and the only question appears to me to be—whether struggle, which is the life of a people, should, because of the frequent injustices which grow out of it, be exchanged for inert languor—moral death? But it was not of this I was either speaking or thinking.'

'You wish to know who built the Crystal Palace?'

'Nonsense,' rejoined M. Vieuxtemps, a little tartly. 'Everybody knows that Paxton designed, and Fox and Henderson erected it.'

'Technically correct; but who set the thing agoing, and now supports it? The multifarious potentate who really does everything in England; and if you have a mind to see him in his representative form, I shall be glad to introduce you.'

'Let me go with you, and be brought face to face, also, with your parliament,' interposed one of the group, Herr von Blunderblast, fresh from Faderland.

This was agreed to; the hour and place of meeting arranged; and we separated.

'It will be a splendid building, no doubt, when finished,' said M. Vieuxtemps, when at the appointed time we met in New Palace Yard. 'A fitter residence for monarchs than to echo the boisterous clamours of a turbulent democracy. The façade on the river side, which I have seen, is very beautiful, and, I am told, nine hundred feet in length.'

'Yes: the czar of all the Russias when here is said to have called the work "a dream in stone." It is certainly a splendidly-enriched edifice.'

'And the cost already incurred is, I understand, enormous,' said Herr von Blunderblast; 'nearly two millions and a half sterling—a fabulous sum to any but English apprehensions.'

'When one reflects upon the gorgeous character and costly decorations of the building, both within and without; that it stands upon a bed of concrete fifteen feet thick, and covers nine acres of ground; that one of its massive towers, the Victoria, will reach a height of three hundred and forty-six feet, the two others not much less; that the octagon court or central hall alone contains two hundred and fifty tons of stone, fashioned into one roof—surprise at the magnitude of the bill of costs vanishes at once.'

'I think the style of architecture,' observed M. Vieuxtemps, 'is badly chosen. The Gothic is very well adapted for a cathedral, for a temple dedicated to the solemnities of religion, but a secular palace should be erected after the sublime models of classical antiquity.'

'I am sorry to say I must agree with you. The edifice is certainly not only in a wrong style of art, but is invested with a frippery in the way of ornament that is very toy-like and unsatisfactory. However, never mind the outside. Let us walk on. Now, we are in Westminster Hall, deeply interesting from historical circumstances. But let us hasten through it. We are now near the object of our search. Yon new and as yet unfinished archway at the further end of the Hall will form a portion of the lobby and entrance to the new Houses of Parliament; those doors on our right lead, as the letters on them indicate, to the supreme courts of law and equity. It is right, in pursuance of the task I have undertaken, that we should glance through them, for there can be no question that to the high character of the presiding judges, their perfect independence of the crown, the firm and impartial manner in which justice—costly, it is true, but still justice—is administered by them, under the check of freely-challengeable juries—the great writs of *habeas corpus*, *mandamus*, *quo warranto*, prohibition, with which they are armed—have greatly aided to produce that feeling of entire security, of individual right, without which the vast industrial energies of this

country would never have reached their present development."

"What odd costumes! The judges and counsel look like mediæval portraits just stepped out of their picture-frames."

"Yes: this wig-and-gown costume always suggests a sensation of the ludicrous to strangers; but John Bull—a man half made up of habits, precedents, and traditions—is not one to discard a custom of antiquity merely because it may appear odd and out of place."

"These high functionaries are doubtless of noble family and descent," remarked Herr von Blunderblast sententiously. "The English aristocracy are well-known to monopolise all dignities."

"Not certainly in our courts of justice. Almost all our legal dignitaries have risen from the middle classes. The law in this country is a laborious and exhausting profession, and men are seldom urged to the exertions it exacts save by the sharp spur of necessity. The chief-justice in this court—Lord Campbell, a peer of parliament—is a Scotch gentleman who owes the eminence to which he has attained entirely to his legal acumen, unconquerable industry, and vast general talent. It is but a few years since he boasted to his Scottish constituents that he was still "plain John Campbell." The chief-baron of this next court—the Exchequer of Pleas—is a relative of the General Pollock, a soldier of fortune, whose Indian exploits you may have heard of. On his right sits Baron Parke, perhaps the ablest legist this country can boast of. The Common Pleas need not detain us—it is but a reflex of the others; nor this Vice-Chancellor Bruce's court—unless it be to remark, *en passant*, how difficult it is to believe, in the presence of the courteous gentleman and distinguished judge who presides, that Chancery can be the hateful and ruinous thing it is."

"Vraiment!" observed M. Vieuxtemps. "The tearing claw of equity does appear to be concealed beneath a smooth and very beautiful exterior."

"This is the Lord High Chancellor's Court. You observe the judge?"

"Yes: a square-headed, decisive-looking man—his cerebral organisation indicative of indomitable energy and keen analytical thought."

"That is Lord High Chancellor Truro, who began life as an attorney. He is now at the head of the administration of the law in this country, and, after the princes of the blood-royal, the first subject in the realm."

"That appears to justify," said M. Vieuxtemps, "a remark I read some time ago in a speech of the British prime minister, which puzzled me a good deal at the time. It was to the effect that in continental countries the aristocracy is the despair, but in England the hope of talent."

"A catching sentence, my dear sir, but to be taken with reservations. Talent in this country, with the exception of forensic, parliamentary, or military talent, has slight chance, I believe, of the peerage. But here we are in Westminster Hall again, and it is now quite time we were on our way to the committee-rooms of parliament. They are completed; but the present temporary entrance is in Abingdon Street, nearly opposite Westminster Abbey gate. We can go through by this last door on the right of the Hall."

We soon reached the small archway in Abingdon Street, strode along the wooden passage, and ascending the seemingly interminable stairs, at last reached the long and splendid corridor in which the committee-rooms of both Houses are situated. Many of the doors were labelled with the titles of the committees, all of the Commons House, sitting within.

"Who appoints these committees, and what are their functions?" asked Herr von Blunderblast.

"They consist of a varying number of members

nominated by the House, to inquire into and report upon the merits or demerits, technical and substantial, of private bills, which are usually passed or rejected according to their report; to decide upon petitions allegative of the undue return of members; and, in short, to inquire into and report upon all matters relative to the administration of the home, foreign, colonial, and financial affairs of the country which the House may choose to investigate. The House also deposes to them its own power of sending for "persons, papers, and records."

"Do you mean to say," exclaimed Herr von Blunderblast, "that these House of Commons Committees can compel ministers, diplomatists, field-marshal, generals, to attend and answer questions relative to the affairs and secrets of their departments?"

"Certainly I do. There was a committee last year sitting to examine into the administration of affairs at Ceylon, and they have published a large "blue book," containing the result of their inquiry. Another is now occupied in investigating the conduct which the government have pursued towards the Cape of Good Hope. But look at the labels on the doors. What do you read?"

"Law of Mortmain; Copyhold Enfranchisement Bill; County-rate Expenditure Bill; Law of Partnership; Customs; Ordnance Survey (Scotland); Great Central Gas Company—Why, all the affairs of the country appear to be regulated by this omnipotent House of Commons!"

"That is strictly the case. The business of the Commons has immensely increased of late years. One reason of this is, that in the Commons must originate all money bills—all bills levying rates upon the people for any purpose whatever; the Peers neither having the power to initiate or change such bills in the slightest degree; they must be either consented to or rejected *en bloc*. This practice necessarily results from the constitutional axiom, acquiesced in by the Lords after many struggles to avoid so great a surrender of practical power, that the Commons are the "granting," the Lords the "assenting" power. In 1671 the Commons passed a resolution that in them alone lay "the fundamental right" in the matter of taxes and supplies—"the measure and the time." There is no professional man who works harder during the session than an active member of the House of Commons."

"What do they get for all this worry and work?" asked M. Vieuxtemps.

"Honour and distinction—nought else. The honour and distinction of writing M.P. after their names."

"I shall never comprehend this money-grubbing, money-contemning, queen-shouting, freedom-loving people," murmured Herr von Blunderblast, "as long as I live—never!"

"This is No. 4 Committee-room. Let us go in; but mind you speak in whispers only when in presence of a fragment of the Honourable House."

"Those everlasting horse-hair wigs again!" ejaculated M. Vieuxtemps.

"Those two gentlemen are counsel learned in the law, who appear for the supporters and opponents of the measure now under investigation."

"What is the measure?"

"It is a private bill that has been petitioned for, and of no kind of interest. Let us rather go into this apartment, where a committee is sitting on a case of election bribery. You will perhaps be amused: the grief and shame belong to us alone."

"Oh, *par exemple!*" exclaimed M. Vieuxtemps when, after about an hour's attendance in the crowded room, we once more stood in the corridor. "But this is scandalous."

"The practice of bribery is a foul blot upon our electoral system; but, except in the spread of education, I know not where an efficient remedy is to be found."

'But the thing is childish and absurd. Here it is proved that needy electors receive a stipulated amount of gold from a person whose name is given; they are also seen swilling beer and spirits; they vote for a particular candidate; and yet the lawyers—the committee—declare that they have no idea, no legal idea, of where the money and the drink came from!'

'A very proper decision in the absence of legal proof.'

'But the overwhelming moral presumption!'

'We to the country which, in judicial investigations, discards the strict, inflexible rules of evidence, to be guided by overwhelming moral presumption! No instrument more potent than that, be assured, to let in the most tyrannous wrong and injustice. What, if such a rule obtained in these committees, would there be to prevent a candidate, certain of being defeated, from bribing, through an indifferent party, two or three electors to vote for his opponent, and thereby vitiate his election? But come, it is near four o'clock, and we had better take our places in the waiting-room to the Strangers' Gallery of the House of Commons.'

'How shall we obtain admittance?' asked M. Vieuxtemps.

'Some of the members we shall find about the library will give us orders. I have never found any difficulty in procuring one.'

'I begin, I think,' observed Herr von Blunderblast, as we retraced our steps towards Abingdon Street, 'to comprehend something of this antique picturesque monarchy we saw the other day, with its heralds, knights, peers, banners, and devices; and your matter-of-fact, prosaic, and, I have little doubt, effective modes of controlling or neutralising its ancient prerogatives and attributes. Our people, it is already clear to me, have studied only the husk and shell of your system, not its inner and vital life.'

'You continentalers certainly labour under some strange fancies respecting our monarchical system. You take us up too literally. We are a curious mixture. Notwithstanding the vastness of popular will, the wearer of the crown, as a centre of authority and fountain of honour, has still immense influence, and in no instance has it been, perhaps, more signally and beneficially displayed than in beating down the vast amount of sinister objection that was raised against the proposed and now triumphant display in the Park. But here we are at the outer door leading to the temporary Commons' House.'

The orders of admission were easily obtained, and we ascended the half-dozen steps on the left of the passage to the Commons, and took our seats in the waiting-room. 'Always,' said I, 'take this seat on the right, just at the head of the stair. The police of the House will only permit us to proceed to the gallery in the order in which we sit, commencing with me. We are therefore sure of a front seat, and the gallery altogether will only hold about sixty.'

'What is that painted on the door yonder?' asked M. Vieuxtemps, who was rather near-sighted.

'Members' Smoking-room: no Strangers Admitted.'

'Ah, then, the Honourable House does smoke. Hello! What's that—tinkle, tinkle? What does the bell mean?'

'That the Speaker has entered the House, and his chaplain commenced reading prayers.'

'There it goes again! What may it now betoken?'

'That prayers are over. If a House is made, the gallery will be immediately opened.'

'What do you mean by making a House?'

'If there be forty members present, the House will be constituted; if less than that number, it will be *ipso facto* adjourned. But we are called—it is all right.'

'What a shabbily-fitted House!' said Herr von Blunderblast as soon as we were seated—'with its

plain straight rows of benches just rising one above the other, worn green leathern seat-cushions, and wooden galleries supported by rude square posts!'

'These are fittings erected since the fire, which you no doubt heard or read of; and as the new House will soon be completed, it has not been thought worth while to incur any great expense for a merely temporary purpose. The two long side-galleries are members' galleries. That at the farther end, behind and above the Speaker's chair, is assigned to the reporters for the press.'

'Then that gentleman with the great wig on, seated in the porch or chair, with the royal arms over it, is Mr Speaker?'

'Yes; and the gowned and wigged gentlemen sitting just before him at the table are principal clerks of the House.'

'On the table I perceive lies the mace which Cromwell bade his soldiers take away.'

'True. The House is getting full. There are in all 656 members, since the borough of Sudbury was disfranchised: 498 for England and Wales; 53 for Scotland; and 105 for Ireland. But it is rare that anything like the entire complement are present. The Ministerial side of the House is on the Speaker's right—the Opposition on his left; but there is much confusion in this respect just now, on account of the number of independent sections of parties into which the House is divided.'

'What are those two red boxes on the table opposite each other for?'

'They are placed there for the reception of papers necessary to the ministry and the leader of the Opposition. The first lord of the treasury, Lord John Russell—'

'Which is Lord John Russell?' broke in M. Vieuxtemps with vivacity—'that short, slight-made gentleman, with his hat pulled over his eyes, or nearly so, and with his legs crossed and arms folded?'

'Yes; and Sir George Grey, much taller, but not with a more intellectual face, is on this side of the noble lord. On the same form or seat there now happen to be sitting the secretary of state for Foreign Affairs, the chancellor of the Exchequer, and the first lord of the Admiralty. Over against them, and directly in front of the other red box, sits in what appears to be a profoundly meditative posture—the honourable member for Buckinghamshire, who—'

'Ah!' exclaimed M. Vieuxtemps, his dim historical recollections suddenly bursting forth—'John Hampden!'

'No—no—no, my good friend!' I said, hastening to correct so strange an anachronism amidst the suppressed titters of the persons around us; 'not John Hampden, but a very accomplished and brilliant debater, and now the recognised leader of Opposition—Mr D'Israeli.'

'Who is the gentleman standing behind one of the small green baize tables placed crossways on the floor, about a fourth of the way up the House?'

'Those tables on each side the gangway mark the bar of the House. The member speaking is reading a report to the House of one of the committees. They are always read there, and so are messages from the Queen when brought down by a minister.'

'But where is the tribune?' asked M. Vieuxtemps—'I do not see it.'

'There is none; the members speak from their places, merely taking off their hats when they rise; and if more than one rises at once, whoever is named by the Speaker, proceeds. The formality and fuss of a tribune would never answer in a House where there is such a mass of briefly-reported but important business-speaking going on in the early part of the sittings.'

'Who is that gentleman with the dress-sword at his

side, just coming down the House?" asked Herr von Blunderblast. "I saw that, like all the others, he bowed slightly on passing the Chair."

"That is the sergeant-at-arms of the House of Commons. Armed with the Speaker's warrant, he arrests members or others accused of breach of privilege—holds them in custody, or conveys them, as may happen, to Newgate or the Tower. He can obtain any amount of force necessary for the execution of the orders of the House."

"That is a formidable power in the hands of a popular assembly."

"It is a necessary power, without which the functions of the House, as the grand inquisition of the realm, could not be carried on."

"I observe," said Herr von Blunderblast, "that many members have a number of rolls of papers in their hands. What may they be—their speeches?"

"No—petitions, which they will in a few minutes present to the House, in the order in which the Speaker calls their names."

"One gentleman with a very white head, on the right hand, about half-a-dozen seats above the bar, has a barrow-load of them."

"He is one of the members for the city of Dublin, and Ireland takes a great antagonistic interest in the chief question for debate this evening."

"What are they doing or saying?" whispered Herr von Blunderblast after a few minutes' silence. "One of the clerks at the table hands document after document to the Speaker, who says something—then writes something on it, and returns it to the clerk. I cannot make out what he says except perpetual "ayes" and "noes," amidst the buzz of the House. The members are conversing with each other—not attending to the Speaker."

"The business now going on is merely of a routine character. The documents handed to the Speaker are private bills essentially decided upon by the committees to which they were referred. They are merely now passing through *pro forma* stages. That last was a railway extension bill. The Speaker read its title, and then said in a breath: "The motion is that this bill do now pass those that are for it say ay against it no the ayes have it." He then writes, as you saw, the decision on the bills, and returns it to the clerk."

"Yes; but those everlasting ayes and noes only come from the Speaker's lips. Nobody else says ay, and nobody else says no: how, then, can the ayes have it?"

"It is, as I told you, a matter chiefly of form. Did any member object, he would rise, state his objection; there would be a discussion, and perhaps a division. These bills, therefore, are really passing without a dissenting voice. But, see, they begin to present petitions. The member states the place from whence the petition comes, the purport of its prayer, and about the number of signatures attached; he then, as you see, walks up and places it on the table. Sometimes, on his motion, the prayer is read at length by the clerk."

"Look, that centre clerk is pitching them all under the table at his feet as fast as they arrive," cried Herr von Blunderblast in much too loud a tone, though fortunately unheard by the gallery official.

"He is cramming them into a large, dark-coloured bag," I answered. "See, here comes an officer of the House with one already full."

"What, then, in the name of common sense, can be the use of petitioning? Nobody is listening: it is all buzz—buzz; and the petitions, placed one moment on the table, are the next crammed into a huge bag and carried out of the House!"

"They are referred to the Petitions' Committee, by whom the substance of the prayer, and the number of petitioners, are recorded and printed, with the votes

and proceedings, for the use and information of the members."

"What is that cross-firing now going on?" asked M. Vieuxtemps.

"Members putting questions of which they have given notice to the chiefs of departments, and the replies of the ministers."

"Wh-e-e-e-w!" whistled Herr von Blunderblast, but fortunately not too loud. "Then a ship-chandler who has contrived to get into parliament may badger and worry the first lord of the Admiralty, as that tall member yonder is doing now?"

"No doubt of it. Any M.P. is an exceedingly important personage; and this is one of the reasons the office, though unattended with a farthing of remuneration, is so eagerly sought after. Fancy the swelling importance, the immense delight of Mr Dobbs, who has by industry and integrity amassed a fortune, and obtained the suffrages of his fellow-townsmen, but is still perhaps at first rather shyed by the local aristocracy, finding himself questioning lords, snubbing right honourables, and possibly reading in the county paper a leader commencing thus: "The important information elicited, or rather, we should say, forcibly wrung, from the noble lord at the head of the Treasury by our talented and esteemed member, John Dobbs, Esq.""

"Hallo!" interrupted Herr von Blunderblast, "the Speaker has left the chair, and they are hiding the mace away under the table!"

"It has been moved and carried that the Speaker leave the chair, in order that the House should go into committee. When that is the case the mace is removed, and the House in committee sit under the presidency of a chairman: in this instance Mr Bernal, who has taken his place, you perceive, at the table, by the clerks."

"What is the *rationale* of this curious proceeding?" asked M. Vieuxtemps.

"This: all public bills, except those relating to taxation or spirituals, which must be grounded upon a previous resolution of the whole House in committee, pass, if successful, through the following stages:—Leave is given to introduce the bill, and it is read a first time; after an interval of an indefinite number of days, it is read a second time; another delay occurs; and then, as to-night, the House goes into committee on the bill, with a view to its examination, clause by clause, line by line, word by word. In committee, a member may speak upon one question as often as he chooses; when the Speaker is in the chair, only once. When the business of the committee is terminated, it is moved that the chairman report progress, and ask leave to sit again; which, if carried, has the effect of bringing the Speaker back to the chair. The House then resumes, as it is called; the mace is replaced on the table; and the business of the assembly goes on as before."

"Those thundering "hears!" they are the "cheers" which I have seen marked in the journals," observed M. Vieuxtemps. "How stirring they are; and what a roar at times sweeps over the House!"

"Yes; an animated debate in the Commons is an exciting affair. Men who can take an effective part in these combats of giants seldom quit the arena unless compelled to do so. Do you mark how fine, how true, how ready the collective ear of the House is? The slightest trip, especially of an ambitious rhetorician, and what an instant explosion of derisive shouts! Dulness the House is often patient of, but inflation, vanity, conceit—never! It is a slippery and difficult floor to stand firm and erect upon, and requires very peculiar powers. Gentlemen, and there are a few, who speak well-reasoned, philosophic pamphlets, are the bores, the pests of the House. They cannot be laughed down, and the only remedy is to let them talk

to empty benches. That which best succeeds is the conventional, but bitter personality—the polite, subdued virulence, which strikes the antagonist rather than his argument. There! It was nothing but a brilliant sarcasm, but with what effect it flashed across the House, awakening as it passed an explosion of exulting or indignant echoes!

We remained silent for some time—the debate lulled, or rather was continued by less effective speakers, and presently Herr von Blunderblast nudged me sharply on the side. 'How's this?' he said; 'we seem to have just caught that white-headed old gentleman's eye, and he is ordering all strangers to withdraw.'

'The House is about to divide, and we must be off!'

Out we went—and the first out, foremost now, were ranged in due order for re-entrance by another door.

'What did they put us out for?' said Herr von Blunderblast, who was somewhat ruffled.

'The fact is, my good sir, we were not supposed to be there at all! No stranger has any right to be present during the deliberations of parliament.'

'Were they, then, not really members who gave us the orders?'

'Certainly they were; but the Speaker, in accordance with one of our numerous conventional fictions, is supposed not to be aware of the presence of strangers in the Honourable House; and should any member call his attention to the fact, they are at once ordered to withdraw.'

'What an utterly ridiculous absurdity this appears to be!' said M. Vieuxtemps.

'Appearance in this case, as in many others, is deceitful. The custom, absurd as it may appear, has its uses. The late Mr O'Connell, by its means, easily defeated a conspiracy on the part of the reporters to burke his speeches. He had them all regularly turned out every evening the House sat; and as the purchasers of newspapers must have the parliamentary reports, the gentlemen of the press were obliged to give in. There is another apparent absurdity and contradiction: a gallery is set apart for reporters, and yet it is a breach of privilege, punishable by imprisonment, to publish the debates. This seeming absurdity has also its uses. The understanding of course is, that the proceedings shall be fairly reported; that no one shall be libelled or ridiculed by the pretended report of a speech. Should such an offence be committed, the printer of the newspaper, as the law now stands, may be summoned to the bar of the House, and summarily punished, technically for publishing the debates, but really for the libel or slander. Were it otherwise, the Honourable House would have to pursue the offender in a court of law, to the manifest loss of its dignity and prestige.'

'I shall never comprehend it!' murmured Herr von Blunderblast once more. 'Never!'

We were soon in, and soon out again. Again we returned, and presently were again excluded.

'What is the meaning of all this?' exclaimed Herr von Blunderblast, who was getting very hot and furious.

'The minority—about forty to four hundred—will not permit the bill under discussion to be further proceeded with to-night; and are moving adjournment after adjournment.'

'Then why, in the name of common sense, do not the majority put an end to such obstruction?'

'To be sure!' exclaimed M. Vieuxtemps. 'Why do they not vote *la clôture*—the close of the discussion, or speech-making?'

'Simply because the majority have no power to do so; and God forbid they ever should have! Nothing more deplorably evinces the utter want of comprehension on the part of continental nations who have copied the externals of our representative system, than

that precious *clôture* of theirs; a mode whereby a majority, not satisfied with outvoting their opponents, of enacting laws to which the people represented by the minority decidedly object, gag them into the bargain. M. Guizot, the year before last, gave his valuable opinion, before a committee of the House appointed to consider whether any means could be adopted of shortening the debates, grounding himself of course upon the great constitutional experience of France, that *la clôture* was a sufficient and quite objectionable remedy; whereas anything more dangerous, more likely to damage irretrievably the representative form of government, could scarcely be devised. It would not at all events do here. There is a tradition that John Lambton—Black Jack, as he was familiarly called in the north, afterwards Earl Durham—once moved that "fresh candles be brought in," as an amendment upon an obnoxious measure which the ministry of the day were endeavouring to hurry through the House—of course only the more emphatically to mark his determination that the matter should not be so hurried.'

'According to your doctrine,' rejoined M. Vieuxtemps, 'a minority might defeat any and every measure to which they objected.'

'Just as the Commons might upset all government by refusing the necessary supplies, the Lords refuse to pass any bill sent up to them, the Queen veto every measure concurred in by the two Houses. These extreme rights exist; and a government of legislative compromise—the safest of all modes of progress—is the consequence. The practical result of the right of the minorities in both Houses is to insure ample discussion; and you may be sure of this, that nothing is more politic than to allow a beaten party to have their full say. But, *allons!* it is useless to re-enter the gallery merely to be turned out again, and we had better be jogging homewards.'

'It is a piece of many-coloured patchwork this governmental system of yours,' said Herr von Blunderblast as we emerged into the street, 'which I can comprehend, though dimly as yet, may practically answer much better than more surface-perfect schemes. But you have not explained how the army—after all, the true force—is to be effectually controlled by speeches, votes, bits of parchment.'

'Oh, the Honourable House has a charming contrivance for that purpose: the Bill of Rights declares that standing armies in time of peace are illegal.'

'Illegal! Why, your standing army numbers upwards of one hundred thousand men!'

'Just so; because every session there originates in the Commons what is called the Mutiny Bill, which, first reciting the unquestionable illegality, enacts that, for various reasons, the crown may, for one year only from that date, levy, maintain, and martially govern regular troops. That act not renewed, the soldiers might walk off to their homes; the corporal, harshly dealt with, if so minded, might knock down his captain with impunity; and the entire army, in fact, would fall at once and utterly to pieces.'

'Then the Mutiny Bill is necessary indeed!'

'It is so; but you have yet much to learn. To-morrow, remember, we visit the Lords.'

'A picturesque and magnificent edifice,' said Herr von Blunderblast, looking, as we shook hands, at the new palace, but thinking, I could see, much more of its inner life than its exterior aspect; 'and yet many of the people who have erected and still maintain it deny that it possesses either beauty or excellence.'

'That is true; but it is not the Victoria Tower, nor the flowering capitals, nor the carved vaultings, which any of my countrymen in their heart of hearts object to: they are merely of opinion that the clustering columns which support the building should have more shafts. They may be right or wrong; but at all events

the shafts, to be either safe or useful, should be in some degree prepared and fitted for the purpose. Good-by!

THE BEAR-STEAK.

A GASTRONOMIC ADVENTURE.

THE Englishman's predilection for a beefsteak is almost proverbial, but we fancy it would take some time to reconcile John Bull in general to a bear-steak, however much we might expatiate to him on its excellence and the superiority of its flavour over that of his old-established favourite, however confidently we might assure him that the bear was a most delicate feeder, selecting the juiciest fruits of the forest and the most esculent roots of the earth for his ordinary nourishment. It might be supposed that this dislike to bear's flesh as an article of food arose from our national aversion to everything that is outlandish; but the following gastronomic adventure, related in the pages of a modern French traveller, proves that our frog-eating neighbours find it just as difficult to surmount their aversion to feeding on the flesh of Master Bruin as the most sturdy and thoroughbred Englishman among us.

M. Alexandre Dumas, after a long mountainous walk, arrived about four o'clock one fine autumn afternoon at the inn at Martigny. Exercise and the keen mountain air had combined to sharpen his appetite, and he inquired from the host, with some degree of eagerness, at what hour the *table-d'hôte* dinner was usually served.

'At half-past five,' replied the host.

'That will do very well,' rejoined M. Dumas; 'I shall then have time to visit the old castle before dinner.'

Punctual to the appointed hour the traveller returned, but found to his dismay that every seat at the long table was already occupied. The host, however, who appeared to have taken M. Dumas, even at first sight, into his especial favour, approached him with a courteous smile, and, pointing to a small side-table carefully laid out, said: 'Here, sir, this is your place. I had not enough of bear-steak left to supply the whole *table-d'hôte* with it; and, besides, most of my guests have tasted this bear already, so I reserved my last steak for you: I was sure you would like it.' So saying, the good-natured host placed in the centre of the table a fine, juicy-looking steak, smoking hot, and very tempting in appearance; but glad would the hungry traveller have been could he only have believed that it was a beef, and not a bear-steak, which now lay before him. Visions of the miserable-looking animals he had seen drowsily slumbering away existence in a menagerie, or covered with mud, and led about by a chain, for the amusement of the multitude, presented themselves to the traveller's eyes, and he would fain have turned away from the proffered treat. But he could not find it in his heart to be so ungracious as to express a dislike to food which the host evidently considered as the choicest delicacy the country could afford. He accordingly took his seat at the table, and cut off a small slice of the steak; then screwing his courage to the sticking-point, and opening his mouth wide, as if about to demolish a bolus, he heroically gulped the dreaded morsel. *Ce n'est que le premier pas qui coûte.* He had no sooner achieved this feat than he began to think that bear-flesh was, after all, not quite so bad a thing as he had expected. He swallowed a second morsel. 'It was really the tenderest and most juicy steak he had ever tasted.' 'Are you sure this is a bear-steak?' he inquired of the landlord.

'Yes, sir, I can assure you it is,' replied the good-natured bustling man as he hurried off to attend upon his other guests at the *table-d'hôte*. Before he returned to M. Dumas at the side-table, three-quarters of the steak had disappeared; and, highly gratified at finding

his favourite dish was so much approved of, he renewed the conversation by observing: 'That was a famous beast I can tell you; it weighed three hundred and twenty pounds.'

'A fine fellow indeed he must have been,' rejoined the traveller.

'It cost no small trouble to kill him.'

'I can well believe that,' rejoined M. Dumas, at the same time raising the last morsel to his mouth.

'He devoured half the huntsman who shot him!' added the loquacious landlord.

Hastily flinging aside the loathed morsel which he had just placed within his lips, the traveller indignantly exclaimed: 'How dare you pass such jokes upon a man when he is in the middle of his dinner?'

'I can assure you, sir, I am not joking,' replied the landlord: 'I am only telling you the simple truth.'

The traveller, whose appetite for further food of any description whatever was by this time effectually destroyed, rose from table, and with a look of horror, begged that the host would acquaint him with the particulars of the tragedy which had now acquired in his eyes so painful an interest. The good man, nothing loth to hear himself talk, yielded a ready acquiescence to this request, and continued his story as follows:—

You must know, sir, the man who killed this bear was a poor peasant belonging to the village of Fouly, and named William Mona. This animal, of which there now only remains the small morsel you have left upon your plate, used to come every night and steal his pears, giving a special preference to the fruit of one fine pear-tree laden with bergamottes. Now it so happened that William Mona unfortunately also preferred the bergamottes to all other fruit. He at first imagined that it was some of the children of the village who committed these depredations in his orchard, and having consequently loaded his gun with powder only, he placed himself in ambush that he might give them a good fright. Towards eleven o'clock at night he heard a distant growl. 'Ho, ho!' said he, 'there is a bear somewhere in the neighbourhood.' Ten minutes afterwards a second growl was heard; but this time it was so loud and so near at hand that he began to fear he should scarcely have time to reach a place of refuge, and threw himself flat upon the ground, in the earnest hope that the bear would be satisfied with taking his pears instead of devouring himself. A few moments of anxious suspense ensued, during which the bear, passing within ten paces of the terrified peasant, advanced in a straight line towards the pear-tree in question. He climbed it with the utmost agility, although its branches creaked beneath the weight of his ponderous body; and having secured for himself a comfortable position, committed no small havoc among the luscious bergamottes. Having gorged himself to his heart's content, he slowly descended from the tree, and returned in tranquil dignity towards his mountain home. All this had occupied about an hour, during which, time had appeared to travel at a much slower pace with the man than it did with the bear.

William Mona was, however, at heart a brave and resolute man, and he said to himself, as he watched his enemy's retiring steps: 'He may go home this time, if he pleases, but, Master Bruin, we shall meet again.' The next day one of his neighbours, who came to visit him, found him sawing up the teeth of a pitchfork, and transforming them into slugs.

'What are you about there?' he asked.

'I am amusing myself,' replied William. The neighbour, taking up one of the pieces of iron, turned it over and over in his hand, like a man who understood such things, and then said quietly:

'If you were to own the truth, William, you would acknowledge that these little scraps of iron are destined to pierce a tougher skin than that of the chamouis.'

'Perhaps they may,' replied William.

'You know that I am an honest fellow,' resumed Francis (for so was the neighbour called): 'well, if you choose, we will divide the bear between us; two men in such a case are better than one.'

'That's as it may be,' replied William, at the same time cutting his third slug.

'I'll tell you what,' continued Francis, 'I will leave you in full possession of the skin, and we will only share the flesh between us, together with the bounty offered by government for every bear that is killed, and which will give us forty francs a piece.'

'I should prefer having the whole myself,' replied William.

'But you cannot prevent me from seeking the bear's track in the mountain, and placing myself in ambush on his passage.'

'You are free to do that, if you please.' So saying, William, who had now completed the manufacture of his slugs, began to measure out a charge of powder double in amount to that usually placed in a carbine.

'I see you intend to use your musket?' said Francis.

'Yes, of course I do; three iron slugs will do their work more surely than a leaden bullet.'

'They will spoil the skin.'

'Never mind that, if they do their work more effectually.'

'And when do you intend to commence your chase?'

'I will tell you that to-morrow.'

'Once more, then—are you quite determined not to let me share the chance with you?'

'Yes; I prefer managing the whole matter myself, and sharing neither the danger nor the profit—*chacun pour soi*.'

'Farewell, then, neighbour—I wish you success.'

In the evening, as Francis was passing Mona's dwelling, he saw the huntsman quietly seated on the bench before his door, engaged in smoking his pipe. He once more approached him and said:

'See, I bear you no ill-will—I have discovered the bear's track, therefore I might lie in wait for him and shoot him, if I pleased, without your help; but I have come once more to you, to propose that we should attack him together.'

'Each one for himself,' replied William, as before.

Francis knew nothing of Mona's proceedings during the remainder of that evening, except that his wife saw him take up his musket at about half-past ten o'clock, roll up a bag of gray sackcloth, place it under his arm, and leave the house. She did not venture to ask him what he was about; for Mona, in such cases, was apt to tell her to hold her tongue, and not trouble herself about matters which did not concern her.

Francis had really in the meantime tracked the bear, as he had said he would. He had followed its traces as far as the border of William's orchard, and, not liking to trespass upon his neighbour's territory, he then took up his post on the borders of the pine-wood which lay on the slope of the hill overhanging Mona's garden.

As it was a clear night, he could observe with ease from this spot all that was going on below. He saw the huntsman leave his house, and advance towards a gray rock, which had rolled down from the adjoining heights into the centre of his little enclosure, and now stood at the distance of about twenty paces from his favourite pear-tree. There Mona paused, looked round as if to ascertain that he was quite alone, unrolled his sack, and slipped into it, only allowing his head and his two arms to emerge above the opening. Having thus in a great measure concealed his person, he leaned back against the rock, and remained so perfectly still that even his neighbour, although he knew him to be there, could not distinguish him from the lifeless stone. A quarter of an hour thus elapsed in patient expectation. At last a distant growl was heard, and in less than five minutes afterwards the

bear appeared in sight. But whether by accident, or whether it were that he had scented the second huntsman, he did not on this occasion follow his usual track, but diverging towards the right, escaped falling into the ambush which Francis had prepared for him.

William in the meantime did not stir an inch. It might have been imagined that he did not even see the savage animal for which he was lying in wait, and which seemed to brave him by passing so closely within the reach of his gun. The bear, on his side, appeared quite unconscious of an enemy's presence, and advanced with rapid strides towards the tree. But at the moment when he rose upon his hind legs, in order to clasp the trunk with his fore-paws, thus leaving his breast exposed, and no longer protected by his broad and massive shoulders, a bright flash of light illuminated the face of the rock, and the whole valley re-echoed with the report of the doubly-loaded gun, together with the loud howl which proceeded from the wounded animal. The bear fled from the fatal spot, passing once more within ten paces of William without perceiving him. The latter had now taken the additional precaution of drawing the sack over his head, and rested motionless as before against the face of the rock.

Francis, with his musket in his hand, stood beneath the shelter of the wood, a silent and breathless spectator of the scene. He is a bold huntsman, but he owned to me that he fairly wished himself at home when he saw the enormous animal, furious from its wound, bearing straight down upon the spot where he stood. He made the sign of the cross (for our hunters, sir, are pious men), commended his soul to God, and looked to see that his gun was well loaded. Already was the bear within a few paces of the pine-wood; in two minutes more a deadly encounter must take place, in which Francis was well aware that either he or the bear must fall, when suddenly the wounded animal paused, raised his nostrils in the air, as if catching some scent which was borne by the breeze, and then uttering one furious growl, he turned hastily round, and rushed back towards the orchard.

'Take care of yourself, William—take care!' exclaimed Francis, at the same time darting forward in pursuit of the bear, and forgetting everything else in his anxiety to save his old comrade from the terrible danger which threatened him; for he knew well that if William had not had time to reload his gun, it was all over with him—the bear had evidently scented him. But suddenly a fearful cry—a cry of human terror and human agony—rent the air: it seemed as though he who uttered it had concentrated every energy in that one wild, despairing cry—an appeal to God and man—'Help! oh, help, help!' A dead silence ensued: not even a single moan was heard to succeed that cry of anguish. Francis flew down the slope with redoubled speed, and as he approached the rock, he began yet more clearly to distinguish the huge animal, which had hitherto been half-concealed beneath its shade, and perceived that the bear was trampling under foot, and rending to pieces, the prostrate form of his unfortunate assailant.

Francis was now close at hand; but the bear, still intent upon his prey, did not even seem aware of his presence. He did not venture to fire, for terror and dismay had unnerved his arm, and he feared that he might miss his aim, and perhaps shoot his unhappy friend, if indeed he yet continued to breathe. He took up a stone and threw it at the bear. The infuriated animal turned immediately upon this new and unexpected foe, and raising himself upon his hind legs, prepared to give him that formidable hug, which the experienced huntsman well knew would prove a *last embrace*. Paralysed with fear, his presence of mind had wellnigh deserted him, when all of a sudden he became conscious that the animal was pressing the point of his

gun with its shaggy breast. Mechanically almost he placed his finger upon the lock, and pulled the trigger. The bear fell backwards—the ball had this time done its work effectually. It had pierced through his breast, and shattered the spinal bone. The huntsman, leaving the expiring animal upon the ground, now hastened to his comrade's side. But, alas! it was too late for human assistance to be of any avail. The unfortunate man was so completely mutilated, that it would have been impossible even to recognise his form. With a sickening heart, Francis hastened to call for help; for he could perceive by the lights which were glancing in the cottage windows that the unwonted noise had roused many of the villagers from their slumbers.

Before many moments had elapsed, almost all the inhabitants of the village were assembled in poor Mona's orchard, and his wife among the rest. I need not describe the dismal scene. A collection was made for the poor widow through the whole valley of the Rhone, and a sum of seven hundred francs was thus raised. Francis insisted upon her receiving the government bounty, and sold the flesh and the skin of the bear for her benefit. In short, all her neighbours united to assist her to the utmost of their power. We innkeepers also agreed to open a subscription-list at our respective houses, in case any travellers should wish to contribute a trifle; and in case you, sir, should be disposed to put down your name for a small sum, I should take it as a great favour.

'Most assuredly,' replied M. Dumas, as he rose from the table, and cast a parting glance of horror at the last morsel of the bear-steak, inwardly vowing never again to make experiments in gastronomy.

WEOVIL BISCUIT MANUFACTORY.

A YEAR or two ago we gave a short account of the celebrated biscuit manufactory of Mr Carr at Carlisle, where machinery of an ingenious kind was made to do wonders in the way of turning out vast quantities of small fancy biscuits, which formerly were made only by hand. We have now the satisfaction of presenting a notice of the not very dissimilar process of biscuit-baking pursued at Weovil, in the south of England; a place known by public report through the frequent visits of Her Majesty in passing to and from Osborne House.

At Weovil are produced biscuits for the royal navy, and there, as at Carlisle, the motive power is a large steam-engine, whose agency is visible in all parts of the establishment. The services of this engine commence with the arrival of a cargo of wheat under the walls of the building; and we should have a very imperfect notion of the ingenuity displayed in the establishment if we did not examine some of the earlier processes. Let us, then, begin with the beginning; and having observed that the wheat is lifted by a steam-worked crane from the lighter to the uppermost floor, let us descend to the floor below, and examine the first process to which it is submitted—that of cleaning. The grain supplied from above flows in a continual stream into one end of a cylinder of fine wirework, about two feet in diameter and ten in length, which revolves steadily in a horizontal position. A spiral plate runs through the interior of this cylinder, dividing it into several sections, and thus forming a sort of Archimedean screw. The revolutions of this cylinder carry the grain onwards through its whole length, so that in the passage any particles of dirt that may have been mixed with it fall through the interstices of the wirework. The effectual character of this operation is exemplified by the quantities

of dirt deposited from wheat which to all appearance was clean before entering the cylinder; the grain thus thoroughly cleansed, descends another stage to the grinding-room (for the wheat is ground on the premises), where ten pairs of millstones are worked by the same steam-power. There is nothing peculiar in the process of grinding; but the manner in which the flour is afterwards collected deserves notice. As it flows from the several stones, it is led into horizontal troughs, along which it is propelled by the action of perpetual screws working in each trough. The contents of all the troughs are brought to one point, whence, by means of a succession of plates or buckets revolving round a wheel on the principle of a chain-pump or dredging-machine, the flour is lifted to the storey above, where it is cooled, sifted, and put into sacks, for removal to the bakehouse. It is not long since we observed in a newspaper the announcement of an invention for collecting and saving the impalpable powder which flies off in the process of grinding corn, and which, containing the purest portions of the flour, has hitherto been wasted. This saving has not yet been effected at Weovil, as our whitened appearance on leaving the mill-room sufficiently testified; but, doubtless, the zeal and ingenuity that has introduced the improvements we are describing will not stop short while anything remains to be done.

We now arrive at the bakehouse, the principal theatre of Mr Grant's ingenuity. We are in a large room on the ground floor—it may be one hundred and twenty feet in length, lofty, and well lighted, the centre portions of which are occupied by machinery of no very complex aspect; and it may be a dozen men and boys, slipshod and barearmed, are moving here and there amongst it. There is no bustle, no confusion; and notwithstanding the unceasing movements of the machinery, very little noise. We are at once sensible that we are witnessing a scene of well-organized industry; but we can hardly persuade ourselves that we see the whole staff employed in converting flour into biscuit at the rate of one hundred sacks per day. In the midst of the general activity, the eye is caught by the figure of one man whose attitude of repose contrasts strangely with the movements going on all round him. He seems to have nothing to do but to lean listlessly with one or both of his elbows on the top of a sort of box or chest, much resembling an ordinary stable corn-bin, which stands against the wall at the left of the entrance; yet that occupation will not account for the mealy state of his bare arms: let us look into the bin, and see if we can discover anything. The bottom of it is filled with water, just above the surface of which, extending from end to end, we see a circular shaft armed with iron blades, crossing it at intervals of two inches apart, and protruding six inches or more on each side of the axle, at right angles with it, and with each other. In one corner of the bin is the mouth of a pipe, which, even whilst we look, discharges an avalanche of flour into the water; at the same moment some invisible power causes the shaft to revolve—slowly at first, that the light dust may not entirely blind us; then, as the flour becomes more and more saturated with water, rapidly and more rapidly, until the whole is thoroughly mixed up together; and in the space of four and a half minutes, one hundredweight of flour is converted into dough. The revolutions of the shaft now cease, and our hitherto inactive friend proceeds to transfer the contents of the bin to a board placed to receive them, in masses

resembling in shape Brobdignag pieces of pulled bread. Again, we see that the surface which a moment since was free from mark or indentation, is now scored all over in hexagonal figures. The lower side of the plate, in fact, consists of a bed of sharp-edged punches of hexagonal form, reminding us in appearance of a gigantic honey-comb, which at one blow divides the dough into single biscuits, leaving no superfluous material except the trifling inequalities of the outer edges. Twenty-four whole biscuits, with a due complement of halves, are cut out at one stroke, each of which is at the same time impressed with the broad arrow of Her Most Gracious Majesty. We now see why the old circular form of the biscuit has given way to the hexagonal. The latter shape manifestly economises labour in the manufacture and space in stowage, while it is hardly more liable than the former to waste by breakage. When it is borne in mind that before the introduction of this machinery every single biscuit was separately kneaded, shaped, and stamped by hand, the extent to which the productive powers of the establishment have been increased may be imagined.

We have now arrived at the last stage of the process, and must for a time lose sight of the biscuits; but we will accompany them to the mouth of the oven. A range of nine ovens occupies one side of the building, but only four of them are ordinarily in use. We are informed that one man attends to two ovens. We notice that the fires by which they are heated are continually burning in one corner of them, even while the baking goes on; so that as soon as one batch of biscuits is withdrawn, the floor is ready for another. A light frame, on which are deposited the trays of biscuits as they issue from the stamp-office, is wheeled up to the oven: the trays are transferred by the baker to the mouth, and thence, by means of a long pole armed with a hook, pushed to the farthest recesses of the oven, where they are carefully ranged side by side, to the number of twelve, when the cargo is complete, and the door is shut upon them. Formerly it was the work of two men to charge the oven; one wielded the peel, which the other supplied with single biscuits; and we have watched with much amusement the unerring accuracy with which constant practice had enabled the latter to hit the mark from a distance of several feet. The new mode is perhaps more prosaic: but not only is the saving of labour great, but it is easy to conceive that the action of the heat can be regulated with more uniformity under it than under the tedious system of introducing and removing the biscuits singly. In fourteen minutes the baking is completed; and thus, in twenty-eight minutes from its first admixture with water, we have a sack of flour weighing one hundred-weight converted into the like weight of biscuits, fit for immediate consumption. A subsequent exposure of two or three days to the high temperature of a room over the ovens, is all that is required to render them fit for packing and storing. We have stated that at present four only out of nine ovens are in use; and the hours of working are from 7.30 A.M. to 2 P.M. Even this limited amount of work is more than sufficient to keep up the requisite supply of bread for the navy; and it is frequently found necessary to stop on alternate days, to prevent the stores accumulating beyond what is desirable. If the whole force of the establishment were set in motion, it would easily, our guide informs us, supply 10,000 men with half a pound of meal and half a pound of biscuit per day. The quality also of the bread is improved, by the uniformity with which all the processes of making it are conducted under the operation of the machinery.

We do not know whether the apparatus we have been describing is in use in any other establishment: probably it is. There seems no reason why it should not be brought into general operation. Though few, if any bakeries can have to supply so large a demand as

that of the Royal Navy, there must be many of sufficient extent to make it worth while saving labour at the cost of the machinery; and though at Weovil it is only applied to making biscuit, the principle of it would seem applicable to the manufacture of any kind of bread. The great labour of the baker is in kneading. The process that effectually kneads flour and water would work equally well if other ingredients were mixed with those primary elements. Due regard being had to the rights of the inventor, we would wish to see his machinery widely employed in private as well as public establishments. It might prove a powerful ally in the cause of cheap bread. It might also be worth the consideration of brickmakers whether the machinery here described might not be advantageously applied to the purposes of their business. There seems a sufficient similarity in the two processes to render such an application of it very practicable. We trust that Mr Grant, the ingenious inventor of this machinery, has received from the authorities some substantial acknowledgment of his valuable labours.

Our object has been to describe the process of making biscuit, as carried on at Weovil. There are many other objects of interest in that establishment, but this is the chief. An inspection of the whole, however, will well repay the curious visitor, and will satisfy him that whatever ground there may be for charging the administrators of our national means of offence and defence with ignorance, imbecility, and extravagance, in the important branch of the commissariat at least neither economy nor efficiency has been neglected.

JHELLABORE.

A PERUSAL of the adventures of Moran Shillelah in a recent number of the Journal has recalled to my Old Indian mind certain reminiscences of a creature who, although in many respects unlike the Irish idiot, closely resembled him in one point; namely, in the devoted and reciprocal attachment between himself and his teacher and protector. As he used to be an object of sympathy in his own town and neighbourhood, a short account of him may perhaps not be uninteresting to a British reader, although the residence of my poor hero was a far distant land.

Chinsurah, situated on the right bank of the Hoogly, and close by the ancient town of the same name, was once the seat of Eastern riches and grandeur; and at the time of which I speak there still existed many remains of decayed wealth and reduced Mogul aristocracy. But with this we have nothing to do, except in so far as Jhellabore* (so the poor maniac was generally styled) was of Mogul descent; but who his parents were, or what their station in life was, I never then thought of inquiring; nor do I recollect that I ever heard his real name; and indeed, although he used to be an object of almost daily sympathy and consideration, I could never have suspected that after the lapse of so many years his image would remain so strongly impressed on my aged brain.

All I knew of Jhellabore was, that he was an orphan, and that he had been placed by his father in charge of a respectable moollah,† who kept a school, and with whom he resided when I first knew him. The moollah had many scholars, but none like Jhellabore: for a Mogul he was fair, and really a beautiful boy, with hazel eyes and curly locks, and slender and delicately made almost to effeminacy. He soon learned to read Hindostanee and Persian; and throwing away his primer and childish stories, he took to studying the beautiful and enthusiastic poets of the East. His mas-

* Signifies decked out. 'Braw' is perhaps nearer the meaning.

† Priest. These priests are kept by rich men to read the Koran daily in their family, and in case of sickness and trouble, at their bedside.

ter, who had the same taste, gave him every encouragement. Jhellābore divided his time between reading his favourite bards and strolling in a neighbouring flower-garden. He might constantly be seen among the gorgeous and strong-scented plants of his sunny clime, reposing in arbours of cheméls and bēlas, or tending the Persian rose or rich white ghonderaj (the king of odours), till the moon shone out in her silvery splendour; and oft would he stand as if transfixed, gazing on the spangled sky, and chanting sonorous and impassioned verses from Hafiz or Saadi.

Doubtless, the impassioned youth's ardent admiration of poetry and flowers, combined with his zeal as a scholar, occasioned his aberration of mind. His imagination was nurtured at the expense of his other faculties. He read and felt till he conjured up aerial visions, the most vivid of which seems to have been a female form of heavenly birth—a houri, with whom he was in love. He became, in short, an Oriental nympholept. At last, when his reason was completely undermined, and he could no longer study—he was then about eighteen years of age—he used to wander about in his favourite garden, clean and tastefully arrayed, with his beautiful black hair hanging in ringlets. He never wore the Mohammedan dress, as he disliked long sleeves and thick clothing. His *dhotee** was of the most beautiful muslin, dyed of some fanciful hue, sometimes rose-colour, sometimes sky-blue, and a silver-edged handkerchief encircled his waist. Over his shoulders was thrown a scarf of the same materials, and dyed to harmonise with his dhotee. In all this, notwithstanding the unhinged state of his mind, he continued to shew much taste and refinement. The garlands of flowers round his neck and upon his breast were too numerous to be counted, but they were never faded or soiled. A yellow champaha flower stuck behind his ear contrasted well with his black locks, and a bouquet of roses or a punka† of bēla buds was in his hand; and a pair of neat buff-leather slippers completed his picturesque dress. He seldom walked out alone in the evenings, but had generally some young gay Mogul companions with him. With these he would enter into conversation, but would occasionally come to a stand-still, and exclaim, with eyes fixed on the heavens, 'Beautiful, rosy-lipped enchantress!—goddess of indescribable loveliness!—I greet thee!' 'Whom do you see?' was sometimes asked. 'It is my Peri—my beloved—ask no more!' was the answer.

The moollah seemed to have regarded the orphan not only as a pupil but as an adopted child, and they had become strongly attached to each other. His death was deeply felt by Jhellābore, and was probably unmixed with selfish regrets, though by this event he was left without support. But Jhellābore was a general favourite, and his young friends took care to supply him with finery, flowers, and a little money; so his days glided on as before, and he never thought of to-morrow. The patron of the deceased moollah had no doubt been an opulent man. The little dwelling and schoolroom had been his gift to the teacher, and after his death they seemed to have become the property of Jhellābore, for there he continued to abide. Adjoining there was also an old-looking tomb—that of the patron, surrounded by a light open-worked trellis-wall, such as may be seen in white marble around the tomb of Momtāza, in the Taj Mahal at Agra. Within the enclosure was a vacant space for another grave, and here the moollah was also buried, and a similar tomb built over him; and so, united in death, the rich and the poor, the protector and the protected, rested together near the scene of their earthly labours.

After the burial-ground had been neatly finished and

decorated, a divan and carpet were placed in it by some charitable hand. Upon these Jhellābore rested when weary, and there, three times a day, he read the Koran, and performed his devotions; and this, notwithstanding his derangement, he could do with propriety and solemnity. The former proprietor of the ground might have rested disregarded and forgotten but for Jhellābore the maniac. There, for his sake, many a passer-by stopped to see the marks of his devoted love to his earthly benefactors and his God.

Many a copper coin was cast, many handfuls of cowries were scattered upon the two whitewashed graves, along with wreaths of sweet-scented flowers, while heaps of little horses* of baked clay lay piled up in one corner. Often have I and my dear old father contributed our adhélah, or half rupee, at the *sanctified* shrine (for such it had now almost become), and marvelled how good frequently accrued from evil; for in all this the Christian could not but trace the finger of God, whatever might be thought of it by the Moslem or Hindoo. As darkness came on, Jhellābore lit his gay-coloured lanterns of talc and gilt paper; and at the head of his master's grave, under the hollow pillar surmounted by a turban, always blazed a cherang or lamp, with sweet-scented oil, while *lobān* or frankincense exhaled its odours around it, and there, during the warm season, Jhellābore would fall asleep.

What became of Jhellābore eventually I know not. Perhaps he was of too ardent and excitable a temperament to be long for this earth. I left the place, and other objects occupied my mind, yet the recollection of the youthful enthusiast is still fresh in my memory.

Before I take my leave of Jhellābore, I may remark that his countrymen—many of whom are superstitious and illiterate—acribed his insanity to the influence of supernatural beings. His wanderings among the flowers at eve was pronounced bad, very bad! Every plant and almost every flower in the East has a mythic or romantic tale attached to it, or belongs to some genius or deity. And to pluck flowers, or even to touch plants and trees at dusk, when all the good and evil spirits are supposed to be abroad, is always forbidden, especially to the young and beautiful.

MEMS FOR MUSICAL MISSES.

Sit in a simple, graceful, unconstrained posture. Never turn up the eyes, or swing about the body: the expression you mean to give, if not heard and felt, will never be understood by those foolish motions which are rarely resorted to but by those who do not really feel what they play. Brilliance is a natural gift, but great execution may be acquired: let it be always distinct, and however loud you wish to be, never thump. *Practise* in private music far more difficult than that you play in general society, and aim more at pleasing than astonishing. Never bore people with ugly music merely because it is the work of some famous composer, and do not let the pieces you perform before people not professedly scientific be too long. If you mean to play at all, do so at once when requested: those who require much pressing are generally more severely criticised than others who good-humouredly and unaffectedly try to amuse the company by being promptly obliging. Never carry books about with you unasked; learn by heart a variety of different kinds of music to please all tastes. Be above the vulgar folly of pretending that you cannot play for dancing; for it proves only that if not disobliging, you are stupid. The chief rule in performing this species of music is to be strictly accurate as to time, loud enough to be heard amid the noise of the dancers' feet, and always

* Dhotee—a piece of cloth without seam, about 10½ feet long and 6 feet broad.

† Fan.

* These horses may be seen near every mosque or shrine where a Moslem mendicant takes up his abode. They are typical of the Borāh, Mohammed's charger, and of the holy horse on which the faithful are to ascend to heaven at the day of judgment.

particularly distinct—marking the time: the more expression you give, the more life and spirit, the better will your performance be liked: good dancers cannot dance to bad music. In waltzes the first note in the bass of every bar must be strongly accented. In quadrilles the playing, like the dancing, must be gliding. In reels and strathspeys the bass must never be running—always octaves—struck with a strong staccato touch; and beware of playing too quick. In performing simple airs, which very few people can do fit to be listened to, study the style of the different nations to which the tunes belong. Let any little grace be clearly and neatly executed, which is never done brilliantly or well by indifferent performers of a higher style of merit. Make proper pauses; and although you must be strictly accurate as to time, generally speaking, it should sometimes be relaxed to favour the expression of Irish and Scotch airs. Beware of being too sudden and abrupt in your nationalities—caricaturing them, as it were—which ignorant and sometimes indeed scientific performers often do, totally spoiling by those ‘quips and cranks’ what would otherwise be pleasing, and which sounds also to those who really understand the matter very ridiculous. Do not alter national airs: play them simply, but as *full* as you please, and vary the bass. In duets, communicate your several ideas of the proper expression to your fellow-performer, so that you may play into one another’s hands—give and take, if I may so express myself; and should a mistake occur, do not pursue your own track, leaving your unfortunate companion in difficulties which will soon involve yourself; but cover it as well as you can, and the generality of listeners will perhaps never discover that one was made, whilst the more sapient few will give you the credit you deserve.

As regards singing, practise two or three times a day, but at first not longer than ten minutes at a time, and let one of these times be before breakfast. Exercise the extremities of the voice, but do not dwell long upon those notes you touch with difficulty. Open the mouth at all times; in the higher notes especially, open it to the ears as if smiling. Never dwell upon consonants. Be distinct from one note to another, yet carry them on glidingly. Never sing with the slightest cold or sore throat. Vocalise always upon A, and be careful to put no B’s before it. Never take breath audibly. Begin to shake slowly and steadily. Practise most where the *voce di petto* and the *voce di gola* join, so as to attain the art of making the one glide imperceptibly into the other. The greatest sin a singer can commit is to sing out of tune. Be clear, but not shrill; deep, but not coarse.

When you intend to sing, read the words, and see that you understand them, so as to give the proper expression. Let all your words be heard: it is a great and a common fault in English singers to be indistinct. Study flexibility. Practise both higher, louder, and lower than you sing in public; and when practising, open the mouth wider than it would be graceful to do in company. Do not change the sound of the letters; sing as if speaking as you can. It is better to sing *quite plain* than to make too many turns and trills: these, when attempted at all, should be executed very neatly. Study simplicity: it is better to give no expression than false expression. Never appear to sing with effort or grimace; avoid affectation and every peculiarity. Never sit when you sing, if you can possibly help it, but stand *upright*. Give more strength in ascending than in descending. Do not suffer yourself to be persuaded to sing soon after eating. Accidental sharps ought to be sung with more emphasis than accidental flats. The Italian vowels *a* and *i* have always the same sound, but *e* has two different ones: the first like the *ai* in *pain*; the other like *es* in *tear*, *wear*, or *swear*. *O* has also two sounds:

one like *o* in *tone*; the other like the *au* in *gaudy*. Articulate strongly your *double* consonants when singing French or Italian. The voice is said to be at its best at eight-and-twenty, and to begin to decline soon after forty, when the more you strain and try to reach the higher notes that are beginning to fail you, the quicker you hasten the decay of your powers. Children should never be allowed to sing much or to strain their voices: fifteen or sixteen is soon enough to begin to practise constantly and steadily the two extremities of the voice; before that age, the middle notes only should be dwelt upon, or you run the risk of *cracking*, as it is termed, the tones. Never force the voice in damp weather, or when in the least degree unwell: many often sing out of tune at these times who do so at no other. Take nothing to clear the voice but a glass of cold water; and always avoid pastry, rich cream, coffee, and cake, when you intend to sing.

A SOLITARY KINGDOM.

On Sunday morning, the 9th December 1849, at three A.M., we made the island of St Paul’s, the southernmost of those twin rocks which frown in solitary grandeur in the midst of the Indian Ocean. The order was given to get the pinnace out, and away we went, steering for a conspicuous sugar-loaf rock, some 150 feet in height, which marked the entrance of the harbour, or, more properly, the lagoon.

After pulling for about half an hour, we reached the entrance of the harbour, where we descried a flagstaff displaying French colours, and several wooden houses, the residence of the owner of the island and his crew. Having volunteered to act as interpreter, I felt rather ‘unfrocked’ at hearing a loud hail, in capital English, ‘Boat ahoy!—keep well in with the shore, and come up to yonder wharf!’—instructions which we followed implicitly, and soon jumped on to the dry land. We were received by three or four ugly-looking Madagascar negroes, who led us up to ‘the captain,’ whom we discovered surrounded with his lieutenants and people, apparently in grave deliberation. There was no mistaking his Gallic face, and I forthwith addressed him in French, stating the name of our ship and her destination, and requesting a supply of vegetables and poultry. He immediately invited us, with a certain rough *empressement*, into his house, and offered us breakfast, composed of Dutch cheese, potatoes, cold fowl, biscuit, and bad rum. The calls of hunger being satisfied, and a cursory inspection of the premises duly accomplished, we sallied out to explore the dominions of our new friend.

The island of St Paul’s (for whose correct latitude and longitude I beg to refer to Horsburg) is merely the crater of an extinct volcano, extending ten miles in length and four or five in breadth. The crater now forms a circular lagoon, enclosed by steep and rocky walls from 800 to 700 feet in height, covered with a stunted vegetation of scrub, fern, and coarse grass. It is rarely visited by shipping, though lying directly in the track of vessels bound to Australia and the South-Sea fisheries. I did not learn how it first happened to be occupied; probably some freebooting adventurer was attracted thither by its merits as a fishing station. The lagoon forms a safe and commodious harbour for small craft, the bar at its entrance being covered at flood tide with ten or twelve feet of water. The present owner is a Frenchman, who had long been engaged in the trade between the Mauritius and Bourbon and the Cape of Good Hope; but having got into some trouble with the revenue officers, fled to the island in a small schooner of about sixty tons, manned by Madagascar slaves; and finding it occupied by a Pole named Mieroslowski (a brother of the Hungarian hero), he bought it of him for the sum of 2000 dollars; and forth-

with hoisting the tricolor, set up a petty sovereignty under the protection of his native flag. Here he instituted a system of rigid discipline, by means of which he contrived to keep the command of his wild followers, and train them to regular work. His ability and energy enabled him to conquer the natural difficulties of his new abode, and he now derives a handsome money income from the produce of his fisheries, making three or four voyages annually to Bourbon or Port Louis, where his old scores had been effaced by the hand of time.

The French Revolution of 1848 brought some change in his calculations, inasmuch as his black slaves all became free, and he is now fain to hire, at stated wages (which, however, are moderate enough), the labour of those poor devils, who were his property before. I was surprised to see no women on the island; and inquiring of him how it came to pass, he told me he had brought some with him at first, but they were the cause of so much quarrelling, that he had found it impracticable to govern his kingdom so long as they were in it, and he therefore shipped them back to the place whence they came. The inhabitants of the Rock consisted therefore of himself and two mates, two other Frenchmen, a half-caste boy, and fourteen Nossibé blacks—the ugliest looking negroes I ever beheld. They seemed to lead a not unpleasant life, with plenty to eat and little to do—the luxuries of the island being biscuit and tobacco, which they cannot always procure. Cows, goats, and rabbits roam about the rocks; and the cheerful cackling of hundreds of fowls forms a homely feature in the otherwise wild and rugged ensemble.—*Abridged from 'The Empire,' a new Sydney journal.*

KEAN AND GARRICK.

Edmund Kean was a great favourite of Mrs Garrick, the widow of the celebrated actor. Whenever it was desirable that a new performer at Drury Lane should make a hit, the committee used to bring the venerable old lady out to her private box, to say he reminded her of David. She said so, and this went the round of the papers accordingly. In the case of Kean she spoke honestly. He did remind her of her husband, and was nearer to him by many degrees than any actor she had ever seen, although both agreed he could not play Abel Drugger. Once in conversation he complained to her that the papers made terrible mistakes as to his conceptions of character, readings, points, and other peculiarities. 'These people,' said he, 'don't understand their business; they give me credit where I make no effort to deserve it, and they pass over the passages on which I have bestowed the utmost care and attention. They think because my style is new and appears natural that I don't study, and talk about the sudden impulse of genius. There is no such thing as impulsive acting; all is studied beforehand. A man may act better or worse on a particular night from particular circumstances, but the conception is the same. I have done all these things a thousand times in country theatres, and perhaps better, before I was recognised as a great London actor, and have been loudly applauded; but the sound never reached as far as London.' 'You should write your own criticisms,' replied the old lady; 'David always did so!'—*Dublin University Magazine.*

A HINDOO FAMILY.

It often happens, especially when there is a little property in a family, that what we would call a dozen families live together, and are esteemed by the Hindoos as one. We once knew a family of this kind which consisted of about sixty members. There was the old man, the patriarch of the family, his four sons and their wives, and ever so many grandchildren of both sexes. All these lived in one house, and had one purse and one table. One of the old man's sons was in government employ; another was a monshee, and taught English gentlemen the native languages; the eldest, as the

father could not then attend to business, was steward of the family, made all the purchases, and received the earnings of the other branches of the family; another son was a hanger-on without employment. The grandchildren of the male sex were either writing gratis as candidates in government offices, or at school, or at home, according to their respective ages. Several of the eldest of these again were also married, and had their wives with them. Many such families as this are to be found still among the Hindoos, where European intercourse has not disturbed the natural course of native society.—*Indian Paper.*

'I AM WEARY—TAKE ME HOME.'

THE pageant was imposing, and the gay assembled throngs,
With plaudits loud and rapturous, rewarded siren songs;
The players don'd their regal robes as mimic kings and queens—
Ah! gold is oft to tinsel changed when view'd behind the scenes!
I knew there was one sadden'd heart which made an inward moan,
In all that goodly companie—for that heart was my own.

A chord was touch'd—a nerve was thrill'd—yet 'twas no dulcet strain,
Awoke the spell old strains can weave—wild memories of pain;
But 'twas because a little child, a fondled child, was nigh,
That recollection wander'd back to scenes and days gone by;
Supported by a mother's arm, to rest her drooping head—
'I am weary—take me home,' the engaging prattler said.

No longer that gay scene I saw—the song I heard no more—
For I was bounding merrily across a greensward floor;
And angel forms that flew away in young life's happy hours,
Disported with me once again all garlanded with flowers:
But when the lambs were in the fold, when gloaming hour had come,
The whisper came as surely—'I am weary—take me home.'

The vision changed—I stood within a dear familiar room;
'Twas darkened, and I long essayed to penetrate the gloom:
With silent awe I recognised a white-robed suffering saint
Waning towards eternity, with scarce a mortal taint;
She spoke with patient sweetness (surely angels waft such sighs)—
'I am weary—take me home'—then on earth she closed her eyes.

I gaze upon the stage of life—I know its tinsel glare,
Its hollowness and falsity, its promises so fair.
Its scenes of misery I view with sympathising heart,
Yet in its bright illusions never more to play a part.
Life's day is short—I rouse from sleep—for gloaming hour doth come,
When the pleading prayer ascends—'I am weary—take me home.'
C. A. M. W.

FRUITS.

Fruits are more acid in the morning than in the evening, because the sun's rays decompose their carbonic acid, and make them part with their oxygen, of which they do not gain a fresh supply until night.

TIME.

TIME is the life of God. We speak of eternity as if it were something contradistinguished from time; but it is merely a term to express our inability to imagine a beginning or an end to time. We cannot indeed imagine time as otherwise than eternal. Sublime thought! and sublime also in no small degree is our connection with it, even limiting our consideration of that connection to the present form of our existence. We can look but a little way forwards or backwards, and find even in that restricted range of vision much obscurity and doubt. Yet how grand to be able to extend in any degree whatever our notion of merely passing time—that in which we happen to live! It is like extending our very life itself. Upon this depends most of the pleasure which men have in historical or antiquarian research, and also in the investigations of geology, which may be called the antiquarianism of the pre-human world. The animal knows and can learn nothing of such things. The ignorant man, who lives only for the day, and in the day, is in the like predicament. It is the privilege of the studious and reflecting man of an advanced civilisation to know them, and to feel how greatly they exalt and expand his terrestrial being.

A zealous scientific inquiry into the past is of such modern date that our retrospect cannot as yet be considered as very clear or precise. It would be rash to lay great stress upon any of its deductions. It is interesting, however, to find that the general tendency of the research is to shew mundane things as of much longer endurance than was formerly supposed. Geology has already seen at an end all objections to the vast chronology which it seeks to establish for the world before man became its ruling inhabitant. Each of its many formations represents an enormous portion of time. Take that of the coal strata alone. If it be true, as most geologists now believe, that each bed of coal is only the last form of a bed of moss—that is, a decayed forest—how great must be the space of time involved in the production of the entire coal series, which in many places is composed of scores of such beds! Look again to the phenomena of disintegration, or the wearing away of rocks. The forming of a cliff by the beating of the waves is a process which we may well see, from the slowness of the operation before our eyes, to involve a great space of time. The wearing back of the Niagara fall from Queenstown to its present position has been estimated as requiring not less than twenty thousand years. Yet these are but the operations of the yesterday of geology. They are only the minutes of its day. And as the science goes on, more and more of such minutes are continually being found,

and inserted in the ever-increasing round. Well may the geologists talk of millions of years as involved in the history of that mere crust of the earth with which they deal!

To a perfectly corresponding purport is the voice of historical research. The commencement of the Egyptian monarchy, and consequently of a system of civilisation in that country, is now taken back many centuries before its former date. Some speak of nearly four thousand years before Christ, and none speak of fewer than four-and-thirty centuries. This is the result of an inquiry into hieroglyphical memorials. But that is not the only means by which we may supply the defect of expressly-written records. The scientific antiquary has dug into the earth for a chronicle of unlettered man, resembling that which geology supplies regarding the lower animals. He finds that all round the coasts of Europe, where civilised nations now dwell, there existed nations for a long series of ages prior to their getting either pens to write or iron wherewith to form implements of offence or of utility. Some came sooner to the use of these articles than others; it is, however, not less than three thousand years since, in some of them, that change took place. Now, in all of these countries there was a period when men, knowing not iron, made use of bronze (an alloy of copper) as a material for such implements. They could *found*, not inelegantly, but they only employed a comparatively unsuitable metal which chanced to occur in a form much more suggestive of its useful qualities than iron. This Bronze Age was one of long duration, though till lately its very existence was unknown. It is a chapter which we have to add to the written history of all European nations; but it is not the only one. Previous to this age, which was one involving some refinement, at least as far as that may be inferred from the state of the arts, there was a ruder one—a lower and earlier formation, as it were—a still older palæontology of the human race. The European nations could then only fashion arrow-heads and war-hammers, knives and chisels, implements for war, the chase, and domestic convenience, as well as ornaments for their persons, out of stone—the pebbles and flints which lay beneath their feet, and the first and readiest of all available materials. The series of events is most natural—the simplest labour and rudest expedients first; next something significant of an improved ingenuity and reflection. But what we have here to do with is the great and almost indefinite extension of human history by such means. The oldest of civilised nations appear to have had to pass through these prior stages, each expressing a long period. As

to Egypt, in particular, the memorials of a Stone Period are traced in the knives of obsidian, and other mineral implements, which, with the characteristic perseverance of religious usages, continued to be employed in embalming after better implements had been obtained for other purposes. Now, add to Egyptian history first a Bronze Period, and then a Stone Period, and it must be seen that we take back the actual commencement of the business of humanity in that region to a point earlier than the most fabulous historians could have ventured to dream of. It is as likely to be ten thousand years ago as five or six. And, after all, was this the oldest group of people describable as a nation? That the human race has lived longer on the earth than even the last-mentioned sum would indicate is manifest from other considerations—as, for example, the slowness of the process of modification by which various sections of the human family become distinguished from one another. If all men have come from one centre and one type, the space of time which would be required for enabling them to put on those peculiarities of figure, style of visage, and, above all, complexion, which we see they have retained with so little change throughout our thirty or five-and-thirty historical centuries, must have been immense. On such a point we can only go by vague impressions; but it does not appear very irrational to suppose that two hundred centuries may have elapsed—if not more than even that—since first the Maker of man placed him upon the earth.

When the results of scientific research are presented in even this imperfect form, if they only suffice to extend the reader's ideas of the duration of this mundane frame of things, they will surely be admitted to make good our starting proposition. It was at first thought ill of that the world was represented as being older than six thousand years; but now that we have learned to think of it as so much older, how poor does the former idea appear! We must all feel that an ancient world is most correspondent to the Ancient of Days, by whom it was created.

While our contemplative connection with Time is made so grand by our sense of the antiquity of things, it must be admitted with a sigh that our actual or practical connection with it—still limiting our considerations to the present form of our being—is in some measure rendered disheartening by the same cause. When we think of humanity alone having lasted so long, and only advanced as yet to the point which we see, we become painfully aware of how small significance and efficacy is a generation of our race. The life of man was always seen to be a short-lived flower; but now it becomes proportionably much more so than ever. The most ardent seekers of reform and improvement are thus taught how little they can expect to accomplish in a lifetime, and how little of the results of their endeavours they can hope to look upon with earthly eyes. They take up the cause from others, and to others it must be resigned. This has always been, to a certain extent, known and admitted, and it involves some elevated views of human nature; for is there not something sublime in this zeal of working for results by which others are to benefit? To continue diligent in such working, when even more sensible of the shortness of individual life in proportion to the great movements of humanity, is so much the more grand. Not that men can justly be said to work on such a disinterested principle; but we know that in the very passions they obey in their efforts to advance in that indefinite improbability which forms the great distinguishing feature of our race, and which has so often been misdescribed as perfectibility, they are under the guidance of an Almighty Will which has arranged our destinies. Clearer knowledge as to the duration of time will never greatly alter the dispositions implanted in man. The individual coral polype works for the building up of

the great fabric which it requires myriads of creatures like itself to complete. Man works in the same way with respect to the great ends appointed for his race by the Creator, whether knowing much or little of the proportion which his single handiwork bears to the great design.

Perhaps there is an error in our ordinary way of contemplating human life. The egotism of man makes the seventy years' span of the individual appear as of the first consequence, and he naturally deprecates the brevity of the period, as with it begins and ends his concern with this world. But the succession of generations is a determinate arrangement attending organised things, for which there must have been powerful reasons in the councils of Omnipotence: continual renewal, it may be surmised, is necessary for the preservation of that portion of nature in a right and efficient condition. The single life appears on this view as an unimportant accident in the case. It might be more just to contemplate the life of a species, or even the life of all the species that were from first to last to occupy any particular planet—an idea at which we may well arrive after seeing it so simply demonstrated by modern science—had such instruction not been afforded through another channel—that both our own species had a beginning, and there was a time (much earlier) when this globe sustained no sort of living thing. Undoubtedly, if we remove our contemplation from the generation to the tribe or species, and think of each of these as one existence, and see how long that existence comparatively is, we must admit that the frail creatures tenanted the earth come into a more respectable relation to time than might have previously occurred to our minds.

While we may be allowed to indulge in such speculations—granting they be entitled to no better name—it is very certain, on the other hand, that man's chief business, as far as his present form of being is concerned, is with the term of individual existence. Let him stretch his soul backward into the farthest past, or forward into the remotest future, still to this little space on the Great Circle his thoughts must come home. Here really dwell his Interests and his Duties. Here must he approve himself a faithful servant of the great Master, if ever. It is most interesting to contemplate, as far as such a thing can be made objective, man going through this little space of time, busy with a thousand matters which seem to him of vast consequence, while viewed in relation to the whole of time they would sink into inappreciable trifles—overlooking all this their character in the grand relation, and rightly doing so, since otherwise the business of the world—the interests of the race at large—would be misconducted. Small, indeed, are the concerns of many: the tilling of an acre, the attending to some small part of a machine, doing some little piece of service to a superior, repeated in its trivial details every blessed day till the end; and yet how fitting and well that such little matters are not merely accomplished, but accomplished often with a gusto and a spirit that redeems them from commonplace! The humble creature feels as if he were doing great things for himself; and is he not really doing so, when he is clearly taking the part assigned by his capacity and the accidents of his birth in the great plan which God has willed? There are also touching views of time as regards the individual. It brings him domestic changes, many of them sorrowful. Sometimes he has a grief which he thinks can never be cured: Time lays on his soothing hand, and the wound closes. He cherishes a memory, and seeks to give it immortality: the stone, though outlasting the feeling, forgets its tale in twenty years, and no one can then say for what it was raised. And yet who would wish to assure a fellow-creature in the first burst of a righteous grief, that in a few months or years it would be forgotten?—or who would think of interposing to prevent that vain

effort to commemorate one who is solely distinguished in the eyes of affection? Times without number has the grief been felt and the affectionate recollection expressed, and yet it is but in the few recent cases that anything has been preserved. When the mourners themselves have disappeared, who are to keep alive the loss and the grief? What a grave of once-felt woes and heart-breakings is the past! Still it is part of nature that these things should be; and God, we may be assured, looks with compassion on distresses of which he knows the evanescence, and which by and by none but himself will remember to have ever existed.

TALES OF THE COAST-GUARD.

THE SMUGGLERS' HOSTAGE.

ONLY one of the seamen wounded in the brush with the smugglers previously narrated recovered.* The other, James Norton, having been hit grievously on the left knee-cap, it was found necessary to take off the leg, and the poor fellow sank under the operation. The most energetic measures were, it may be supposed, immediately adopted to bring the guilty parties to justice. The government offered a large reward to any one—excepting, of course, those who fired the fatal shots—that would give information leading to the conviction of the offenders, and an active inquiry was at once set on foot, and vigorously carried on throughout the neighbourhood. The result was the apprehension of a number of persons to whom suspicion pointed, and the ultimate committal of five of them to the Winchester March assize on the capital charge. It was, however, very doubtful that we had secured one of the chief culprits. There was no evidence that the men in prison were owners of the goods attempted to be run, were armed at the time, or in any way concerned in the affair, save as temporary helpers; and even on this last point the proof with regard to two or three of them was by no means clear. From the blood-tracks leading to a considerable distance, discovered the morning after the affray, it was certain that the hurried and random shots of the seamen must have taken severe effect upon several of the fugitive contrabandists, but not one of these wounded men could be found; and it was greatly feared that the deaths of the two men would remain unavenged. Once during the preliminary investigation I thought we had a chance of letting daylight in upon the confused and foggy business. I was called out of the justice-room at Hamble, where the depositions were being taken before several of the county magistrates, to see a woman who said she had an important communication to make to me in private. This woman, a slightly person, with a clear, healthy, open English look, though now overcast with bitter grief, I had frequently seen before, and knew her to be the wife of one of the prisoners, Richard White by name, the youngest, and, as I thought, the least implicated of them all. They kept, I knew, a chandler's shop at Hythe, on the south shore of the Southampton River, and just on the skirts of the New Forest. But for one or two self-betraying words dropped in the flurry caused by his sudden apprehension, there was really nothing against him except that he had been seen in close, covert discourse with two of the other prisoners on the evening the unfortunate collision took place. His wife, I found, had been terribly scared by a remark of one of the magistrates, and the instant we were alone, she asked me with a hysterical whimper, if I really thought they would hang Richard.

'There cannot be two opinions about it,' I promptly replied, desirous of deepening the impression made upon her. 'In fact, morally speaking, I look upon him as half-hanged already.'

'Oh dear!—oh dear!' sobbed the woman. 'What, for mercy's sake, is to be done? Suppose,' she added hesitatingly—'suppose Richard to be willing, would he, do you think, be allowed to turn king's evidence?'

'He knows, then, who the rascals in chief are, where they are to be found, and'—

'I did not say that,' she hastily interrupted. 'I did not say that: I only meant supposing—suppose Richard'—

'Oh, never mind supposing!—don't think to bamboozle me with supposes!' I sharply rejoined. 'Persuade your husband to make a clean breast of it whilst there is yet time—if indeed it be not already too late,' I added, as the door of the justice-room opened, and the prisoners, handcuffed and strongly guarded, came out—for both he and his companions are, I suppose, fully committed for trial.'

The wife screamed violently at the sight of her manacled husband—a youngish, meek-faced chap, looking as if butter would scarcely melt in his mouth—and endeavoured to embrace him, but was roughly pushed back by the constables. The examination, I found, had been adjourned till the next day, when the prisoners would be again brought up for the formal completion of the depositions.

Mrs White again approached me, as, after a few minutes' conference with the magistrates, I was leaving the place. She was yet paler than before, but had ceased whimpering; and there was a feverish light in her eyes which I thought indicated that she had taken a resolution, though seemingly a painful one.

'I worked, sir, as you are aware, many years for Miss Warneford before I married,' began the woman; 'and as she knows me to be honest and trustworthy, I thought perhaps you might be willing to help us through this trouble?'

'There is nothing like helping one's self, Mrs White, depend upon it,' I answered, 'in this as in every other trouble. Your husband can steer clear of the gallows without my assistance.'

'Are you sure, sir, that if Richard could point out where the men who shot Batley and Norton are to be found, he would himself get clear?'

'There cannot be a doubt about it, and pocket the reward into the bargain.'

'No—no. God forbid! We'll have no reward—no blood-money!' she added with a shuddering whisper; 'not if it was the Indies of gold! We'll sell all, and leave this part of the country. When can I see Richard?' she resumed after a brief silence—'see him alone, away from the evil companions who have brought this shame upon him. I can persuade him, I know, to save his own life and mine.' Without further preface I conducted her to the solicitor for the prosecution, and it was arranged that she should have an interview with her husband early on the following morning previous to the final examination of the prisoners.

I was early in attendance at the temporary court-house the next day, where I found Mrs White sitting alone in a small waiting-room in a state of fevered yet dumb anxiety and fear. It was already whispered that her husband was to be admitted evidence for the crown, and the wife had sought the concealment and refuge of the anteroom from the scowling looks and muttered threats of the numerous groups of people waiting outside for the appearance of the prisoners. It was clear to me that she herself wavered in purpose and resolution, and, but for the belief instilled into her that there was no other mode of saving her husband from the gallows, would at once have retracted the solicitations to which it was understood he had reluctantly yielded. The moral code of the amphibious inhabitants of the coast did not, it must be borne in mind, affix any very deep stain upon the act of shooting the two seamen. It was done, according to them, in hot blood and self-defence, and though to

be regretted for the victims' sake, was by no means to be looked upon in the light of a common or deliberate murder. This state of opinion of course branded the expected betrayal of his comrades by Richard White as a dastardly crime of the blackest dye; and when he was brought up, a yell of execration burst forth which completely unnerved him, and I greatly feared that the necessary disclosures would not be made. As he was passing the door of the waiting-room where his wife sat cowering with shame and terror, he stepped eagerly towards her, seized her almost fiercely by the hands, and exclaimed in a shaking voice: 'I cannot do it, Martha—I can't, and I won't.' The poor woman burst into tears, and with a choking voice, as she clung round his neck, urged him, though falteringly, to save his own life—hers—that of their child. The pleadings of the wife and mother were again successful—the more easily, perhaps, that the howlings of the mob had ceased, or at all events could not be heard where he then stood. The prisoner was immediately conducted before the magistrates, and I went in at the same time. The chairman briefly assured him that if he should be the means of bringing the men who actually slew Batley and Norton to justice, there could be no doubt the king's pardon would be extended to him. White trembled very much while thus addressed, and his changing countenance plainly shewed how violent were the conflicting impulses by which he was alternately swayed and dominated. At last he spoke, but the first faint, husky words were interrupted by the vehement yet indistinct cry of a woman; and then his wife burst into the room, wildly exclaiming: 'No, no, Richard—don't—not a word, for God's sake—not a word!' The apparently frantic woman, before any one could interfere, reached, threw her arms round her husband, and whispered something, with rapid and smothered accents, in his ear, which it was immediately plain would deprive us of our witness. The woman's inflamed, disordered aspect was perfectly maniacal; and the moment she saw that White comprehended her meaning, away she flew out of the room with the same wild hurry she had exhibited on entering. The suddenness of the thing took everybody completely by surprise, and excused the fault of the constables in permitting her to approach the prisoner. After the lapse of a few minutes White was again asked if he had any statement to make: 'Only,' he doggedly answered, 'what I've said afore—that I am innocent of the sailors being shot, and mortal sorry for it too!' Nothing further could be got out of him. The angry and menacing warning of the chairman produced no impression; and finding both threats and expostulations useless, White was finally committed with the other prisoners, to take their trials at the Hampshire assize on the charge of wilful murder. The woman's extraordinary behaviour had been caused, it was conjectured, by a communication made to her by a seafaring man a minute or two after her husband had gone into the justice-room. She had instantly, on leaving the court-house, taken boat for Hythe.

Weeks wore away, and the month of January had arrived without bringing any additional fact to light in connection with the affair. In the meantime I had been zealous and active in my vocation, but although tolerably successful, not nearly so much so as I conceived the many sources of private information I had in various ways contrived to obtain, the carefully arranged and boldly-executed schemes I had devised, and the perseverance with which I followed them up, entitled me to expect. The smuggling fraternity proved keener hands than I had judged them to be, not unfrequently taking the wind suddenly out of my sails when upon the most ingeniously-contrived tack, and at the very moment I was hugging myself upon assured success. This remarkable sagacity in penetrating my designs, when just on the eve of fulfilment, gave rise to numberless hazy suspicions which I was exceedingly

anxious to clear up, and it was not long before a very unexpected and remarkable opportunity of doing so occurred.

I was fond of wild-fowl shooting, and occasionally used to amuse myself with a duck-gun upon the Southampton Water, chiefly off Marchwood and Millbrook, up towards Redbridge, where tolerable sport was frequently to be found. One afternoon, when thus engaged, accompanied by one of the cutter's crew, in a small hired boat, it suddenly came on about half-past three to snow furiously. I had gone rather high up the river, and as the tide was flowing, the pull back to Southampton in such bitter and blinding weather was an unpleasant and laborious one. I took an oar just to keep myself from freezing, and we had reached off Cracknor Hard, near Marchwood, when I caught sight of a large boat, whose character and present occupation could not be mistaken. She was about to creep up, as it is called, a number of tubs sunk there under adverse circumstances perhaps, or in order to their being fished up and secured at the first favourable opportunity. There could be no doubt with respect to the business in hand, as I could distinctly see two men, about two hundred yards apart on the shore, waving their arms to shape the boat's course to the exact spot where the tubs had been deposited. The mode by which the contraband confederacy manage to place a precise and—the great point—an *invisible* mark, where a boat or larger vessel may find it prudent to sink her cargo, is simple and ingenious enough: two persons on shore, standing two or three hundred yards apart—the boat or vessel being about midway between them—first carefully mark the places on which they stand, and then each of them notes the object on the opposite shore in line with the boat and himself. It is obvious that the two men have but to stand again in the same places, and wave the boat into line with the distant object—to the point, in fact, where the line of sight of both meet and cross, and the exact spot will be ascertained and reached. If there be no opposite shore or distant fixed objects, the operation is more difficult and uncertain, but to clever and practised hands a star will suffice. This process in trigonometry was now going on; and considering that we were near the shore, and almost within call of assistance—that there were but five men in the boat, all probably unarmed, whilst we had a loaded duck-gun and a pair of double-barrelled pistols, which the frequently sudden exigencies of the service had taught me never to be without—and that, moreover, the Nelson school in which I had graduated instructed its pupils not to count adverse odds too curiously, I determined to make one amongst them—two, rather, if the man with me, who had only about a couple of months previously entered on board the *Rose*, should prove worth anything, as of course I supposed he would.

Our two oars were at once unshipped; and first ordering the man to take the gun and lie close in the bow of the boat, I seated myself at the stern, and sculled quietly stem on towards the smuggler. The atmosphere was so thick with the driving snow and fast-falling darkness, and we glided so noiselessly through the water, that I nothing doubted of closing unobserved with the busy and preoccupied smuggler, when that rascal Rawlings jumped suddenly to his feet, exclaiming in a loud voice: 'They have mizzled, sir; let me help pull!' and then seizing an oar without waiting for a reply, he made a circle with it through the air, and let it fall heavily into the row-lock. Sure enough they saw us plainly enough now, and were off in a crack, and at a speed which rendered pursuit both hopeless and absurd. Rawlings, unable to face me, kept his eyes fixed in the direction of the smuggler; and upon reflection I was rather glad he did so, as my first impulsive movement, with the half-formed intention of throwing him overboard, had thereby, I thought, escaped his notice. A

few moments restored my habitual self-restraint, and I said as calmly as I could: 'They are off indeed, and it is quite useless striving to overtake them. Do you take both oars, and pull as quickly as you can to the near steps of Southampton Quay.' He did so, and I presently bethought me of discharging the gun, since there was no longer the chance of a shot either at ducks or smugglers. It happened, I could not conceive how, that the mouth of the barrel had become choked with snow, and it consequently burst, about twelve inches down, scattering the fragments in all directions. I was unhurt, but Rawlings uttered a sharp cry of pain, dropped the oars, and clapped his hands to his forehead. A jagged piece of iron had struck him there, and the wound, though I could see not at all a serious one, bled profusely. He either was, however, or pretended to be in great pain, and I determined on landing at Cracknor Hard, and getting the hurt looked to. This was done. A Marchwood practitioner examined the wound, stanching the hemorrhage, and jestingly remarking how fortunate it was the iron had struck so slightly-susceptible a part as the head, pronounced the injury to be unimportant. This opinion the man did not at all coincide with. He still appeared to suffer greatly, and I agreed that he should sleep at the public-house—the only one there—for that night at all events, and if not quite restored, the next also; but to report himself on board on the day following at the latest. This arrangement effected, I walked to Hythe, and there took boat for the *Rose*, then lying about three miles farther down the river, very earnestly employed the while in running up various trifling matters previously logged against Rawlings to a certainly significant though still perplexing sum-total. There was, however, I did not doubt, a good time coming, and that I determined patiently and very watchfully to await.

I had arranged to dine the next day and spend the evening with my sister and a few friends; and accordingly, at about three o'clock in the afternoon, I arrived at Pear-Tree Green. Important news awaited me. Mrs White had been there in a state of great agitation, to request that I would cross over to Hythe as soon as it was dusk, where, on landing, I should be met by a girl in a red shawl, who would conduct me to her. It was necessary, she left word, that I should be alone, and not in uniform, but well armed; and that it would be advisable a strong party of the cutter's men should be ordered to lie within hail off the Hythe landing-place. Fortunately the boat which brought me to Itchen had not yet proceeded on its return, and I immediately sent for the coxswain, Tom Sawley, a man in whom I had entire confidence, and gave him directions in accordance with Mrs White's suggestions. I then swallowed a hasty dinner, changed my dress, crossed over the ferry, and it being quite dark when I reached the Southampton Quay, at once embarked in a wherry for Hythe. A girl in a red shawl was, I found, waiting on the Hard, and the instant I had landed, she walked smartly away. I followed, and she led on in the direction of Fawley. We had left the village about half a mile behind us, when the girl gradually checked her hitherto rapid pace till I had come up within speaking or rather hearing distance. She then, still continuing her walk, and without looking round, said: 'That whitewashed cottage yonder on the right, Captain Warneford, is the place where Mrs White expects you. Take no notice of me, and walk in without knocking. There may be people watching us now.' The cottage pointed out was about a couple of hundred yards ahead, and there was no other habitation that I could see near it. I walked on as the girl directed, lifted the latch, and there, sure enough, stood Mrs White alone, as pale as a spectre, and shaking with nervous agitation. It was a wretched place, with a clay-floor, and the only articles of furniture visible in the dull light of a penny candle were a crazy three-clawed

round table, two broken rush-bottomed chairs, and a rusty iron fender and poker. This was not, be it understood, Mrs White's home.

'Now, then, Mrs White,' I said after a brief recognition, 'bear a hand, if you please, with whatever communication you intend to favour me with. I trust also,' I added, finding she did not answer so quickly as, in my impatience, I thought she ought to have done, 'that you will keep this time a steady, straightforward course, and not suddenly double and run off when least expected to do so. You know what I mean?'

'I do; and presently I will tell you why I acted so strangely. I have now to inform you that the men who are believed to have killed Batley and Norton are within two miles of this spot. They are four—though one, Tom Etheridge, need care little now for earthly kings or justices. He is dying, if not already dead. They were all wounded by pistol-shots. Three have been for some time recovered, and to-morrow night they quit the Forest, I think, for the Welsh coast, if you permit them to do so.'

'If it depend on me, my good woman, you may be sure that Winchester, not Wales, will be their destination.'

'One of the cutter's men, Sam Rawlings, is a confederate of the smugglers.'

'By Jupiter, I have thought so!' I interrupted. 'The impudent rascal! But never mind, go ahead.'

'The boat which he risked a good deal yesterday, he says, to prevent falling into your hands, is that in which they propose to take their departure, Rawlings with them, who is determined not to trust himself again on the deck of the *Rose*.'

'He is right; but go on—who are the others?'

'The chief of them is Daniel Squibb; you must have heard of him.'

'Frequently, and always as a hardened, reckless ruffian with whom the trade of smuggling is but an occasional, and compared with others he indulges in, a respectable occupation.'

'That,' said the woman in a low voice and with a perceptible shudder, 'is, I believe, quite true. The others, besides Etheridge, are Harry Withers and William Stokes. You must also know them by name at least.'

'I do. And now what is to hinder us from summoning the men, who no doubt by this time are off the Hard, and securing the fellows—but two miles distant you say—at once?'

'That cannot be,' promptly rejoined the woman in a peremptory tone. 'That cannot be, Lieutenant Warneford. You must first meet those desperate men alone.'

'Alone! You must have lost your senses to propose such a thing!'

'It would be no wonder if I had,' she sadly replied; 'and I have no doubt that I shall do so if you fail me. I cannot think you will: you are known to be a daring man, and in a close hand-to-hand struggle must, I should think, from sheer personal strength, as well as frequent practice, be more than a match for any ruffian, however powerful.'

This very complimentary speech took me thoroughly aback. 'Why, what the dence, Mrs White,' I cried, 'are you talking about? I am not certainly so likely to faint at the click of a pistol-lock or the flash of a cutlass as a school-girl; still I have by no means the enthusiastic love for close hand-to-hand encounters with desperate men which you appear to suppose.'

'I will explain,' said the agitated woman, 'as briefly as I can. You must recollect my little boy—you have frequently seen him at Miss Warneford's?'

'Ay—a little rosy-cheeked fellow, four or five years of age.'

'Yes,' ejaculated the mother with a spasmodic cry of grief. 'He, the light, and joy, and hope of my life, has been taken from me'—

'Dead!'

'No, no; but worse—far worse I fear, but that I trust in you. You remember the morning my husband was to have told the magistrates where the men whose names I have mentioned might be found?'

'To be sure I do, and the fool's trick you caused him to play us and himself.'

'It was no fault of mine. The rumour that Richard intended to turn king's evidence was—how I know not—in everybody's mouth hours before he had promised me to do so. A minute after my husband entered the justice room with you, a man came to me and whispered that my child had been secured as a hostage, and was at that moment in Squibb's power, who had sworn to kill him should the hiding-place of the ruffians be discovered through my husband's or any other person's information. The villain would, I knew, keep his dreadful word were he certain of being hacked in pieces the next moment for doing so. I hastened home in a state almost of frenzy, to find the terrible statement true. The child had been wiled away, no one I dared question knew by whom, or how, or when. He is still in Daniel Squibb's power, and should they be attacked, the first victim would, I well know, be my child. I have since ministered to their necessities like a slave, in the hope that when they left the place my boy would be restored. Yesterday I was told by Squibb himself that he should, for fear of accidents, take the child away with them; and if he does,' exclaimed the unfortunate creature with a wild bitterness of grief, 'I should never see him more—never, except perhaps at the hulks, or the gallows, for which he would be fitly trained. Save me, Lieutenant Warneford,' cried the frantic woman as she fell on her knees and strove to grasp mine—'save me from that living death: my boy from the horrible fate which must else overtake him. You have faced death a hundred times for mere honour's sake, and will you now shrink back when humanity, compassion, generosity, pleading for a helpless, brokenhearted woman—for the menaced life, far more, the menaced soul, of an innocent child—implore your help?'

This was certainly a very delightful predicament to find one's self suddenly and unexpectedly placed in, and I must say that I was quite as much puzzled and confounded as excited and distressed. Here was a little woman, certainly somewhat, and yet not much above her class, all at once endowed with, and breaking into a strain of pathetic and reproachful eloquence for my especial benefit; and for the benevolent purpose, as it seemed—for I as yet hardly comprehended what she was exactly driving at—of inducing me to sacrifice my own life in order to afford her a chance, and a poor one, of saving her son's!

Still the woman's agony of grief affected me, and I said as I raised her up: 'If you can shew me, Mrs White, that there is a fair chance of success, it will be another matter. What is it you propose?'

'This!' she answered with great readiness. 'The girl you saw will go for the men. The instant they arrive you, I, and they will set out together. The sailors must stop at a spot within about three-quarters of a mile of Squibb's and his companions' hiding-place. You and I will go on. I shall enter the place with a message from Rawlings, whom I saw about three hours ago. They are without any light at night; I can secretly introduce you into the building, and place you in concealment close to Squibb and the child. I will then return for the men. We will approach as silently and swiftly as possible, and when near you will hear this.' She whistled a bar of a popular tune. 'It is their private signal-whistle, and will not alarm them. When the rush takes place, Squibb will endeavour to seize and slay the child; but a brave and powerful man like you will surely be able to shield the boy, even against all three of the ruffians, during the very short time that will elapse before they are completely overpowered?'

'Upon my word, Mrs White,' I said, 'you have sketched a very pretty play, which I have no doubt will go off to the entire satisfaction of everybody except the person you propose honouring with the principal part. Why not let the seamen approach, in the first instance, within call of the fellows' hiding-hole? That would greatly diminish the risk.'

'That would never do,' she said; 'they would certainly be discovered, and the child would be at once massacred out of revenge.' In short, she had such a multiplicity of replies to all I could urge against the scheme, and was so vehement in her entreaties, that seeing that it was not an altogether desperate undertaking, and remembering how anxious the gentry at headquarters were to secure the slayers of the two seamen, which object could not be accomplished without Mrs White's aid, I at last agreed to try the venture.

'You give me your word of honour as a gentleman,' said Mrs White, 'that after I have shewn you where to find Squibb and his comrades you will not attack them in any other mode than that upon which we have agreed?' I gave the required pledge; the girl in the red shawl, furnished with the necessary credentials, started off to summon the men; and the instant they arrived we made silently, in a zig-zag direction, towards Fawley, keeping ourselves as much as possible within the shade of the forest trees. After about twenty minutes' march the men were halted, and Mrs White and I proceeded alone.

She stopped as we were about to emerge into a more open part of the forest. 'Look there!' she whispered. 'You see the farm building in the direction of the light beyond?' I nodded assent. 'It is there the men you seek are sheltered. The farmer to whom it belongs,' added the woman with a meaning smile, 'has never been near it since Squibb happened to find the key in the outer-door, and no one would think of suspecting so very respectable a man of harbouring smugglers. Now, Lieutenant Warneford,' she continued with great seriousness of manner, 'attend to what I say. There is a man always looking out from an upper loft. You see the hedge on the right: crawl along the further side of it, and make cautiously for the gable-end of the building. There is a small door there which I will gently open. A few feet within there is a ladder leading to the place where the men lie, but you will be concealed from them by a number of trusses of hay and straw: the seamen must rush in at the large gates, of which I have got a duplicate key.'

Having thus spoken Mrs White moved swiftly off, leaving me, I must confess, in no very enviable state of mind. Her scheme, ugly enough at first view, did any thing but improve upon more intimate acquaintance, and I had half a mind not to proceed further with it. There were, it seemed, four sturdy ruffians, including the look-out—now for the first time heard of—to contend with; and should I be discovered before the arrival of the seamen, the result could scarcely be problematical. Nevertheless, sustained by the professional contempt of danger in which I had been reared, the knowledge that I possessed remarkable skill with the pistol, and the recollection of many perhaps greater perils successfully overcome, I ventured on, and in about ten minutes found myself close by the door at the gable-end. So far all was well. I could hear a confused murmur of voices within, but nothing distinctly. At last the door gently opened, and Mrs White appeared at the aperture. She was, I saw, ghastly pale and trembling with terror now the moment of trial had come, bravely as she before talked of the business. Her finger was on her lip, and she motioned me to go in. I did so as softly as if I had been treading on eggs. The door closed behind me, and it was black as the inside of a tar-barrel. In a few moments my eyes became better accustomed to the darkness, and perceiving the ladder—a weak,

slight affair—I placed my right foot softly upon one of the lower rungs, which, the instant my weight was fairly upon it, snapped short in the middle with a loud crack. 'What's that?' cried one of the fellows in a fierce voice, apparently a few inches only overhead. 'It's me,' promptly replied Mrs White, who was standing just without the door, listening in terrified silence. 'Do you want me?' 'Not I,' returned the surly savage; 'only mind you don't forget—for I don't like your looks, as I told you—that upon the first alarm I'll blow this young un's head off as sure as my name is Daniel Squibb. I say,' he again called out after a few moments' silence, 'what time did you say Sam Rawlings would be here?'

'About ten o'clock he said,' answered Mrs White. A grunt of satisfaction was the only reply. The door again closed, and I, with better fortune than before, noiselessly ascended the crazy ladder. A small corner of the floor, I found on reaching it, was partitioned off from the rest, as Mrs White had stated, by trusses of hay and straw, behind which I crawled, and after a while contrived to get a view of the amiable party to whom I found myself in such dangerous proximity. The moon shone brilliantly in upon them, and I could see their features distinctly. They were all dressed and armed with pistols stuck in their waist-belts. The great brawny figure of Daniel Squibb was stretched upon a heap of straw, covered by some dirty blanketing, and by his side lay a young child—fast asleep, I thought, judging by the natural ease and grace of his reclining posture. Two others, Stokes and Withers, were sitting half up in similar beds, and farther on lay a fourth. It required but one look at the white, rigid, pinched features, and open blindly-staring eyes, to recognise it as the recently-deceased, untended corpse of Etheridge, whom I had frequently seen. Excepting frequent pulls at the black bottles, one of which stood by the side of each of the living men, there was nothing done or said for some time. At last Squibb, happening to look in the direction of the dead body, said with a half shudder: 'Throw a blanket over the face, Harry; it ain't pleasant to look upon, specially just now.'

'It's a good thing though,' resumed Squibb, after another suck at the brandy bottle—'it's a good thing he's gone. We can be off now without any fear of leaving him to peach upon us. But for that we might have mizzled two or three weeks ago.'

'Ay, Matey,' replied Withers, 'that's true, but I misdoubt Mother White.'

'So do I; but this young fellow here will keep her within bounds. She don't seem to have any notion that we are off to-night.'

'I don't think,' said Withers; and the trio relapsed into silence, broken only by the *glug glug* of the liquor they swallowed, as it glided out of the necks of the bottles down their seasoned and unslakable throats.

Mrs White expected to return with the men in about half an hour; but that time had long past, and still they came not. I was becoming feverishly impatient, when the signal-whistle was heard, instantly replied to by the look-out in the loft above.

'Who can this be?' said Squibb. 'It's not time for Rawlings yet, according to Mrs White.'

The three fellows rose and listened anxiously, and I observed Squibb take a pistol from his belt and cock it.

The look-out man now made his appearance. 'It's only Rawlings,' he said.

'All right!' echoed Squibb, evidently greatly relieved, and returning the pistol to its place.

Presently I heard footsteps approaching by the way I had entered. The only thing apparently now to be done was to sell my life as dearly as I could, and I collected myself in the dark corner where I was shrouded for that purpose. The new-comer stepped briskly up;

and without pausing to look round, made his way over the hay and straw to his friends.

'You are early, Sam,' remarked Squibb. 'White's wife said you would not be here till ten o'clock.'

'I wasn't going to tell her exactly when I was coming or we were going.'

'All right!' interjected Squibb with an approving nod.

'Dick Hessel's boat will be off Luttrell's Folly at twelve o'clock to-night precisely,' added Mr Rawlings.

'That's capital, Sam!' replied the chief of the gang. 'And you, I suppose, mean to shove off with us?'

'That I do indeed. The skipper smells a rat, and I shall be brought up with a round turn when least expected or desired if I don't make myself scarce, now I have an opportunity.'

'I should like to catch that Mr Warneford,' said Squibb with a bitter, venomous accent, and his blood-shot eyes, inflamed with drink, sparkled with deadly ferocity—'I should like to catch that fellow within a couple or so of yards of this little barker'—and he again drew forth and flourished a long pistol—'some fine night with nobody but ourselves within sight or hearing, and if I didn't drill a neat hole through his canister, it would be a pity, that's all.' The other fellows savagely coincided in Squibb's pleasant aspiration.

'It was a bold stroke entering on board the *Rose*,' continued Rawlings; 'but it's getting much too risky now, so that—Hollo!—who's that, I wonder?'

It was a repetition of the signal-whistle, and, judging by the tremulous weakness with which it was given, I guessed by whom. The five fellows—for the look-out had not returned to his perch—became rigid and breathless with eager attention. The whistling was repeated. 'That's Martha White,' said Squibb; 'what but mischief can bring her here again?' He then grasped the little boy, who had been for some time awake, with fierce violence by the hair. 'Dare to whimper,' he said in low, deadly tones, 'or breathe louder than usual—only dare!'

'Lend me a back,' said one of the fellows, 'that I may look out at the window.'

'Hark!' cried Squibb. 'There is some one unlocking the front gate. Who should that be? Look over the stairs, Stokes—quick! quick! By all the devils, if it be, as I suspect, I will blow this imp's brains out whatever be the consequence—quick!' and the ruthless savage held the muzzle of the pistol within six inches of the head of the boy, who seemed dumb with terror.

I hesitated for a moment how to act. To shew myself, and rush upon the scoundrel, would in all probability precipitate the child's fate, Squibb now being at a distance of four or five yards from me. Adopting another expedient, in full reliance upon my oft-tried skill and coolness, I took deliberate aim at the ruffian's head, steadying my arm upon a haytruss, and waiting only to be sure as to who the new-comers were.

'Who is it?' again fiercely demanded Squibb. 'Speak, will you?'

'Betrayed!' shrieked Stokes. 'The coast-guard are upon us!'

As the first syllable left the man's lips I fired. The report was followed by a frightful yell from Squibb. The bullet had struck his right jaw and broken it. He whirled round with the sudden agony, and the pistol in his hand dropped harmlessly on the floor. The next moment all was uproar, confusion, and dismay—the loud shouts of the sailors, the frenzied screams of the woman, and the maledictions of the smugglers, who, after a vain show of resistance, essayed to escape by the way I had entered, mingling in deafening uproar and confusion. They were all secured except Rawlings, who contrived to escape; and very luckily for him that he did so, or unquestionably the reward for

his share in the business would have been an hour's dangle at the yard-arm. The instant I shewed myself Squibb, though frightfully mangled, and for some moments stunned with pain, snatched another pistol from his belt, covered me, fired, missed, and I immediately grappled him. He was a burly, powerfully-framed man, but he was so enfeebled by drink, his recent illness, and present wound, that I pinned him to the floor almost without an effort; and as soon as the bustle was over he was properly secured, and carried off, foaming and blaspheming with rage. Mrs White hugged her child, so fortunately rescued, with convulsive passion, while incoherently pouring forth joy and thanksgiving to Heaven and blessings upon me.

The prisoners were tried and found guilty of the capital charge, Richard White being admitted as approver, but neither of them suffered the extreme penalty of the law. They were all, however, transported—three for life, and the others for varying terms. White and family removed, I believe, to London. They never claimed the reward.

RAMBLES IN SEARCH OF WILD-FLOWERS.

A BEAMING July day, which in many an inland place would have been far too hot to admit of exercise, but which was rendered delightful by the invigorating influence of the sea-breeze, was that which I selected for a view of the bogs in their summer beauty; yet although the said sea-breeze had wonderful effect in mitigating the heat of the atmosphere, I thought it wise to keep still during the early hours of the day, and not to start on my expedition until after an early dinner. I also considered that the pleasure of my ramble would be enhanced if I indulged myself with a donkey to take me to the scene of action, so that I might not arrive there fagged and heated by a rather over-long walk, and thereby in some degree unfitted for making the serious attack which I meditated on the treasures of the bog. Behold me, then, at about four o'clock, with my botanical case slung to the pommel of my saddle, and my donkey-boy armed with a basket and trowel, for the purpose of securing any roots I might wish to get, and with my mind full of cheerful visions of coming pleasure, setting forth on my expedition. I chose the shady lanes through Knowle, considering that by so doing we should be less exposed to the rays of the sun, and proposing to return by the heathy hills when the cool air of the evening would be streaming over them.

Our course lay through a succession of true 'Devonshire lanes,' lanes which are so devious, and lead into each other in such a manner that you may not unfrequently, after walking for an hour, find yourself at the very point from which you set out. We, however, were no novices, and made no false turnings. Passing through a deep cut in the red sandstone rock, high banks of which—clothed at intervals with hawthorns and other plants and flowering shrubs, and on which I am told the apple-moss (*Bartramia pomiformis*) grows—rising on each hand, and the sand lying so deep under foot as to make it difficult to get on, we at last entered on a verdant lane, and fell on the course of the most limpid of brooks, some five or six feet wide, along the side of which—but, alas! the side out of our reach—stood a rank of most noble foxgloves (*Digitalis purpurea*), hanging their spotted purple bells over the water, mixed with groups of elegant ferns, some erect, others drooping and feathering the edge of the stream with their graceful verdure, the whole array so beautiful that I

could scarcely turn my eyes from it. And then the scintillations of light which glimmered on the waters as its bustling little waves caught the sunbeams breaking through the leafy trees above added new beauties to the scene; and as each little wave caught the light in its turn, and then hastened on into the deeper shade beyond, yielding the gilded passage to another, which as rapidly passed by, it read me a moral lesson on the fleeting nature of the brightest of earthly honours.

My first discovery of Dalceage was merely accidental, for I had never heard that such a place existed. I was riding over the hill, when a sudden turn in the by-road I was pursuing brought the lovely little spot into sight. Just before me lay a small patch of richly-wooded ground, the trees in their full spring verdure, and under their shadow stood a group of picturesque cottages, with all the usual adjuncts of labourers resting at their doors, surrounded by their children—cows assembled for milking, &c. &c. It was quite a Gainsborough scene. Above the little orchard which flanked the cottages lay a sort of petty *tarn*, overhung by beautiful trees. I found, on a nearer view, that this was in fact merely the brook widened, and forming a milldam, around the edges of which wild-flowers had congregated, apparently undisturbed for ages. From this dam flowed the brook whose course I had been following, which, after passing through the village of Budleigh Salterton, eventually joined the sea just opposite my cottage. What a treasure is a clear-flowing brook! From its little spring-head, where the peasant fills his water-can, or waters his flock, on it flows over rock, bog, or plain, through wood and wild, to the fair meadows, which become fairer from its reviving presence. As it widens, it becomes perhaps a harbour for the speckled trout and other fish, which tempts the angler to linger beneath those noble oaks and elms which grace its border; and then it ripples in a slow shallow stream over the pebbles and stones which obstruct its course, forming a pleasant and safe place for the cottage children to dabble with their bare feet, and to swim their little boats. A little farther on it may extend itself into a dam, and turn the mill-wheel, thus benefiting the whole district through which it passes; and after affording to many a rustic family a bountiful supply of that element so needful to life and comfort, on it goes, its banks ever fringed with flowers, and its course marked by its fertilising influences, straight on its appointed course to the river or sea, which is its ultimate destination, exhibiting as it flows a striking emblem of the course of a quiet, healthy-minded Christian, walking in his appointed path, and striving to do good to all around him, his unobtrusive life noticeable only from the marks of usefulness and the kindly charities which flow out on all within the sphere of his influence.

The brook-side and the hill are all a maze of flowers, and the bog a perfect 'paradise of dainty devices.' So I leave Jack, my donkey, to browse among the fern leaves, and in defiance of mud, make my way down to the water's edge. But oh the disappointment I experience on finding that the flowers which looked so temptingly attainable are all ensconced behind an edge of black bog, mud, and water! There is the beautiful bog-bean (*Menyanthes trifoliatum*), with its great trefoil leaves, and lovely fringed blossoms by the hundred, all but within reach; but even with the aid of a crooked stick, and advancing till I get such a *taste* (as Paddy

would say) of the black mud, that further care of my dress is superfluous, I cannot gather them myself! Like Cowper—

'With cane extended, far I sought
To steer them close to land;
But still the prize, though nearly caught,
Escaped my eager hand!'

Alas! no water-spaniel had I to help me to get my water-lily; so making a virtue of necessity, I agreed that George, my donkey-boy, who had long been pressing such a step on my attention, should take off his shoes and stockings, and wade into the mud; and now nothing hindered me from the delight of possession, and large handfuls of the exquisite flower were safely landed, and stowed away in my tin-case. The bog-bean, or marsh-trefoil, as it is sometimes called, is of the natural order *Gentianeae*, and contains throughout the plant that strong, bitter principle which makes some individuals of this species so valuable in medicine. The *menyanthes* itself is used among the peasantry, especially in the Highlands, for a tonic decoction, and is also not unfrequently employed as a substitute for hops. The flower is very elegant—its calyx is firm and sturdy, divided into five segments; as is the corolla, which is formed of one petal, and its disk covered with white, threadlike fibres, which look like a most delicate white fringe. The texture of the petal is like that of a lily, and its hue a soft flesh colour, tipped with red. The flowers grow in racemes—that is, numerous flowers, each on a separate footstalk, and arranged on a common flower-stalk—the stem rising from a sheath at the base of the leaf. The leaves are ternate, or divided into three leaflets, which are slightly toothed, and both in colour and texture, though not in form, resembling those of the common broad bean. The flower-stalks rise from ten to fourteen or sixteen inches in height, and the leaf-stalks are nearly as long, but not so upright in their growth. The plants are gregarious; and where they grow at all, they spread freely, forming large groups, the roots being so densely matted as even sometimes to render firm the ground of the bog where they grow. And this fact reminds me, that a little digression on the best means of safely effecting an inroad on a bog may not be amiss, and may save a young beginner in the art of bog-trotting sundry discomfitures. In the first place, then, never on such an expedition wear any attire which it would distress you to get well muddled. In shabby clothes you are above minding such trifles as a stumble or even a downright fall into the mire; but wo to the lady who ventures into a bog in a handsome dress! Her temper and spirits will surely sink even lower than her feet, and all the flowers she may gather will not compensate for her anxiety and loss of composure. Then make it a rule never to plant your foot on any spot which looks tempting, and presents a dainty carpet of moss and sun-dew: be sure that where the pale green and red are most brilliant, and the surface looks the most lovely, there lies below a deep pool of the blackest mud and coldest water, into which your foot will sink to a depth enough to reach your ankle, if not to plunge you forward, so that the other foot will follow the leader, and make you a spectacle to behold! and very likely you will not escape without leaving one of your shoes at least at the bottom of the mire. Now all this may be in a great measure avoided by carrying a good, strong, and long stick in your hand, and testing with it every place whereon you may think of stepping. Then take it as a rule, that those spots where the roots of rushes or ferns have been so long established as to make a sort of bristly hillock, will be safe footing; and if you place one foot on one of these, then, supporting yourself with your stick, draw the other carefully after it, and from thence feel for your next landing-place, you may tra-

verse a great part of a bog, and come in contact with some of its richest treasures, without being much the sufferer; but, with all care, bog-work is and must be dirty work; and the only plan to feel at ease when bent on exploring, is to wear shabby clothes, and be provident enough by carrying with you some clean shoes and stockings, with which, in some cottage or thicket, you may replace your wet ones, to avoid all chance both of cold and discredit.

After we had sufficiently supplied ourselves with the coveted flowers, my boy George and I parted company—he to scour with his bare feet the less accessible parts of the bog, and I to pursue my more modified course low and as I could; whilst Jack, all exultant, enjoyed festival, and cropped the herbago round him. One of my first spoils was a delicate little yellow-blossomed flower, with soft, downy leaves, which was quite new to me. It had rounded leaves and creeping stems about six inches long—the whole plant prostrate and hairy. I found, on my return home, that it was the marsh St John's wort (*Hypericum elodes*), a plant by no means common even in bogs, to which it is entirely confined. The whole tribe of the *Hypericineae*, of which I hope hereafter to give a general sketch, is very interesting to me; but the *Hypericum elodes*, though on examination evidently a true scion of the stock, does not at first sight seem to bear the characteristic marks of that tribe. One of my next discoveries was the pretty lesser scullcap (*Scutellaria minor*), which though by no means so handsome as its congener, *Scutellaria galericulata*, is an elegant little labiate plant, and by no means common. Its height is from four to six inches, the flowers of a pale-reddish purple, and the lower lip white, dotted with red. The common scullcap grows about a foot high, and the flowers, which are much longer than that of *S. minor*, are of a bright-purplish blue. It is exceedingly pretty. The concave form of the upper lip of both species, which much resembles that of the monk's-hood, seems to have suggested the trivial name, as that member of the corolla would form an elegant little cap or hood for some fairy's head!

I was now again following the course of the fair little brook, which, running from the hills above, trickled over the bog to the milldam—its very clear water imbibing a yellow hue and a brackish taste from the character of the soil which lay below it, and its banks inlaid with mosses, asphodel, bog pimpernel, and other bright flowers; and ever as I stoop to gather one of them, my sense of smell is regaled by the very peculiar, and to me pleasant, odour which rises from the watery earth, and clings to every leaf and flower that I cull from its bosom. Whether this odour proceeds from the earth or the water, or exhales from the plants, I know not: it may be the result of the decaying vegetable matter which lies below. But whatever it is, it pervades the whole ground, and everything gathered in a bog partakes in some measure of it. The evening was now getting on, for much time had been lingered away by the ferny brook, and in other ways; and the sun began to cast deeper and longer shadows from the trees, and the birds to pour forth their even-song of delight in fuller and richer strains; and as I stood there all alone, and surrounded by hills and trees, and water and flowers, I could scarcely refrain from exclaiming—

'Strange! there should be found
Who, self-imprisoned in their proud saloons,
Renounce the odours of the open field
For the unscented fictions of the loom;
Who, satisfied with only pencilled scenes,
Prefer, to the performance of a God,
The inferior wonders of an artist's hand!'

Though close to cottages and their inhabitants, the spot whereon I stood was like a mountain solitude, and long did I stand contemplating it, and neglecting the

main business of the hour—that of collecting. But was I not collecting? I was indeed—not plants, but thoughts! treasures of thought on which to fall back at an aftertime; and pictures—not such as I could hang on my walls, but those which would adorn my mind and memory. I was collecting from the song of birds and the murmur of the water, from the scent of flowers and the beauties of sunshine and shade, of hill, and vale, and tree, rich hoards of thought, and grateful remembrance, which have since cheered and refreshed me.

But my reveries were disturbed by George, who came splashing through the morass at full speed with a huge bunch of heterogeneous articles flourished high in air, and his 'Here, ma'am, please what's this? and this?' soon recalled me to my botanical self. Among other things—some of interest, and others worthless—he displayed a noble handful of the beautiful and delicate butterfly orchis (*Habenaria bifolia*). It was not my first introduction to this interesting plant, which is not confined to bogs, but may be found also in woods. But as many of my readers may not know it, and as it grew in this bog in greater profusion than is common, I will venture to give its characteristics; and in so doing I shall be obliged to enlarge a little on those of the whole of that wonderful and curious tribe, the orchideæ.

The leading peculiarity of the orchis tribe is, that its column consists of a stamen, a style, and a stigma, all grown into one solid body. The anther is formed of two vertical cells, in each of which is a mass of pollen; the style is thick and short; and the stigma a shining, moist depression in front, under or between the masses of pollen. The genera vary exceedingly in the structure of the different parts, but in the consolidation of the style and stamen they are agreed, and this forms the characteristic of the orchis tribe. The arrangement of the sepals of the calyx and the petals of the corolla are so very singular as to leave it doubtful to a common observer which is which; and these parts are in many of the species so disposed as to assume the form of some animal or insect. In England we have not above sixteen varieties of the true orchis; but the ophrys, which is of the same natural order, has many of the same peculiarities of form and character—the leading difference between the two genera being, that in the orchis the nectary is elongated into a tubular sput, of which the ophrys is devoid. Many of our most curious insectivorous flowers, which are called orchideæ, belong, in fact, to this genus. The beautiful bee orchis (*Ophrys apifera*), the fly orchis (*Ophrys muscifera*), the late and early spider orchises (*O. arachnites* and *O. aranifera*), and the drone orchis (*Ophrys fucifera*), all of which are more or less rare, belong to the genus ophrys; whilst the monkey, the lizard, and the frog (*Orchis tephrosanthus*, *O. hercina*, and *O. viridis*), belong to the orchis family. The *Aceras antropophora*, or green-man orchis, though closely allied to the orchis, is not one. Its corolla when spread out closely resembles the human form, whence its name. Then there is the elegant little flower *Neottia spiralis*, the 'ladies' tresses,' which also ranks among this extensive tribe: this may be found in August and September, its straight and leafless stem rising abruptly from the earth, with its small, highly-scented flowers, of a greenish hue, disposed on short footstalks spirally along the upper part of the stem. The curious 'listers,' or 'tway blades,' are congeners, and well deserving notice, as are many others of the tribe, which we cannot now notice specifically, but among which are some of the brightest ornaments of our fields and woods in spring and summer, and also some of the most lusciously-scented of those which regale our sense of smell. In foreign countries the orchis tribe is far more extensive and wonderful than in our own colder climate. In Europe, the species all grow on the ground in meadows or marshes, hills or woods; but in tropical

lands these glorious flowers are seen in all their beauty; and, 'seated on the branches of living trees, or resting among the decayed bark of fallen trees, or running over mossy rocks, or hanging above the head of the admiring traveller, suspended from the arm of some monarch of the forest, they develop flowers of the gayest colours and the most varied forms, and often fill the woods at night with their mild and delicate fragrance.' Humboldt says: 'The orchideæ enliven the clefts of the wildest rocks, and the trunks of tropical trees blackened by excess of heat. This form, to which the vanilla belongs, is distinguished by its bright-green succulent leaves, and by its flowers of many colours and strange and curious shape, sometimes resembling that of winged insects and sometimes that of the birds, which are attracted by the honey vessels. Such is their number and variety, that to mention only a limited district, the entire life of a painter would be too short for the delineation of all the magnificent orchideæ which adorn the recesses of the deep valleys of the Andes of Peru.' Klotzsch reckoned 3545 species of this wonderful family as known at the close of 1848, and doubtless multitudes more have since been discovered. But though this tribe is so varied and attractive in form and scent, it possesses, I believe, but few species which are of the slightest use to man. One is the vanilla, which is used to flavour creams, &c. and which is a pod of a kind which, in the West Indies, creeps like ivy on walls and trees; and there is one other, the shoemaker plant (*Cyrtopodium Andersonii*), whose stems afford a gluten which the Brazilians use for sticking thin sheets of leather together. Still, the tribe is most interesting indeed.

The glowing descriptions which we meet with in books of this family of plants would almost be enough to lead one to abandon the comforts of home, and roam in distant lands for the mere purpose of realising such wonders. But even in England it is a glorious tribe. Though many of the species of the orchideous family may be more curious than that of which I first spoke, the *Habenaria bifolia*, there is, I think, none more truly elegant and attractive. By Linnæus and others it is called *Orchis bifolia*, but by Hooker and other modern botanists *Habenaria bifolia*. The root of this plant is an undivided tuber tapering downwards; the stem in general from twelve to eighteen inches high, though I have seen it in moist woods exceeding two feet: it has two root-leaves of a long-shaped oval, from between which rises a semitransparent stem, crowned with a long loose spike of large yellowish-green flowers of wax-like texture and very peculiar form. The lip of the nectary is lance-shaped, and not more than half as long as a threadlike tubular spur which hangs down behind the blossom, and gives it its peculiar character. The sepals of the calyx, which are of the same pale-greenish hue as the petals, spread downwards, and the complete corolla has somewhat the form of a small butterfly; its insectivorous appearance is not, however, so marked as that of the fly and bee orchiseæ, some specimens of which might really deceive one into the idea that the blossom was a fly or bee pitched on a stalk. I never see the butterfly orchis without being reminded by it of some tall fair girl, whose growth has overshot her strength, and whose fragile form indicates a fear that she is not long for earth. Another of the characteristics of this sweet flower may tend to carry out the illusion, and happy for the fading girl if it is indeed found in her. When the sun goes down, and the shades of evening descend, this flower throws out from its pale blossom a fragrance so rich and powerful as to pervade the whole air for a considerable distance. So have I seen a fair young creature, when the shades of sickness were spreading round her, and the bright things of earth were fading from her sight, pour out from some hidden source a sort of moral fragrance in the

atmosphere which surrounded her sick couch, making all who breathed it feel that she was more precious to them, and her influence more refreshing to their souls in those twilight hours of existence, than she had ever been in the bright sunlight of her more vigorous life—even as that sweet evening-scented flower has a greater value when its perfumes are poured forth on the night than when its daylight colours delight the eye. And whence comes this sweet influence? Whence the patience, and meekness, and gentleness, the spirit of love and holiness, which, like sweet dropping balms or Eastern gums, thus impregnate the moral atmosphere of the sickbed with soul-subduing fragrance? Surely it can only be from the influence of God's Holy Spirit dwelling in the heart, and imparting to it of the nature of Him whose very name is 'as ointment poured out!'

The rarer kinds of orchis are not to be found near Budeleigh Salterton, at least I have never seen any of them there except *Orchis pyramidalis*, which is rare in some places. Those I have found are, *Orchis mascula*, *O. maculata*, *O. morio*, *O. pyramidalis*, *O. latifolia*, and *O. conopsea*. Nor have I found any other of the orchideous family there except the ladies' tresses (*Neottia spiralis*.) The bee orchis abounds on the more western parts of the coast, and I shall not soon forget the delight I have felt in seeing a whole hillside as thickly covered with this beautiful little flower as I have seen fields with cowslips. I had large handfuls gathered for me, and my vases filled with them for two or three succeeding summers, without seeming to lessen the multitudes which sprung up in every direction; but such profusion is not common, a scattered gleaming being all that can be had in any locality I at present know.

Before I left the bog, I found fine specimens of *Alisma ranunculoides*, the lesser water-plantain, with its pale, purple tripetalous blossoms, which is not common, and many other specimens of interest, but, warned by the lengthened shadows, I now bethought me of returning homewards. Setting my boy, therefore, to catch Master Jack, who appeared by no means to relish leaving his pleasant browsing, I retreated to one of the cottages, and after obtaining leave to change my bog-stained shoes and stockings for some dry and clean substitutes which I had brought with me, and obtaining a piece of brown bread and a cup of milk (from the cows whom I had seen assembled for milking) for myself, and another for George, I set forward on my homeward road; but not over the hill, as too much time had been already expended to leave sufficient for me to botanise its heaths and other produce. I therefore return by the lanes, only crossing the little rivulet, which now meets me again. I rejoin the high road at a point a little farther from the village than that at which I had left it; and in so doing I pass a little triangular spot of ground, presenting one of those strangely-arbitrary arrangements which all conversant with the habits of plants occasionally observe. This spot of ground is only separated from the little enclosure where I found the *Equisetum sylvaticum* (as mentioned in a former paper) by a mere belt of wood, and the soil, &c. appears to be exactly of the same character as in that enclosure; yet here, throughout the year, I find scarcely one flower similar to those which grow there: there are in it no orchises nor polygals—neither hyacinths, equisetum, nor potentillas; the only thing which abounds there is the lovely blue forget-me-not (*Myosotis palustris*), a plant wholly unknown to the little enclosure where the above so enamel the ground! These arbitrary arrangements are very common, though to me wholly inexplicable. I have known rich banks of violets in one field, whilst in the next, apparently exactly similar in soil and aspect, not one was to be found; a circuit of fields golden with cowslips, whilst one poor, solitary field lay between, in which not a single root could be found; and so with other flowers. But I linger too long, and the rising moon admonishes me that it is high time to

hasten forward and get home; so, sending Jack into something like a trot, I make my way down the village, now all alive with those just released from business, and seeking the sweet, cool evening air, and arrive safe, though tired, at my cottage door.

EMIGRANT SHIP 'WASHINGTON'

IN describing lately the excellent accommodations on board certain vessels bound for the Canterbury Settlement in New Zealand, we alluded to the wretched treatment occasionally experienced in emigrant ships from Liverpool and other ports to America. It is proper to remove any doubts that may be entertained on this subject. A notion prevails that the government emigration officers—one of whom is stationed at each principal port—protect the interests of passengers, and generally save them from being ill-treated during their voyage. It is nevertheless clear, that in spite of the interference of these functionaries, and also in defiance of strict legal enactments, passengers of a humble class are on many occasions treated with extreme barbarity. It is indeed sickening to reflect on the discomforts, misery, pain, and even premature death, arising from no other cause than the brutality of officers commanding emigrant vessels. Unfortunately, the misconduct of these persons is in some instances beyond the jurisdiction of English law. They sail under a foreign flag, and can be proceeded against only in the courts of their own country: in which case there may be said to be a complete denial of justice; for what emigrant, on arriving at his destination, will take the trouble and be at the expense of waiting months, perhaps years, to prosecute a delinquent skipper?

One of the worst cases of this kind which has come into public notice is that lately detailed in a Return to the House of Commons, ordered 19th February 1851, respecting the emigrant ship *Washington*. Drawing our information from this parliamentary paper, the following is the account of the affair:—

Mr Vere Foster, a person of respectable character, who appears to be engaged in the shipment of emigrants, had heard numerous accounts of the improper treatment of passengers to America, and to satisfy himself as to their truth, took the extraordinary step of becoming himself a steerage passenger in a vessel sailing under the American flag bound for New York from Liverpool. The ship was the *Washington*—a remarkably fine vessel of 1600 tons burthen, with two good passenger decks, each between seven and eight feet high, and well-appointed in every respect. Her crew consisted of thirty-one men, three boys, and five officers—namely, the captain and four mates—and she had on board upwards of 900 passengers, whose sleeping berths were a shelf along each side of the whole length of the two decks, with low boards dividing the shelf into berths all of one size, and each containing from four to six persons. One end of the upper deck was divided off as a separate apartment, containing twelve enclosed cabins, each having two, four, or six berths, and each berth containing two persons. The passengers in this part of the vessel paid a somewhat higher price—namely, L.5 instead of L.3, 15s. or L.4. Mr Foster occupied one of four berths in a cabin of this kind. Each passenger in the ship had a contract-ticket, in which certain provisions were stipulated for, with a supply of water daily, and right of cooking. Some extra provisions, which cost 10s. 6d., were taken on board by Mr Foster and his companions in the cabin. All things being nearly ready for departure, the passengers were inspected by a surgeon, and ordered on board. We shall now allow Mr Foster to tell his own tale, which he does in a letter to Lord Hobart, dated 'Ship Washington, 1st December 1850:—

'All the passengers who arrive at Liverpool a day or more before the sailing of an emigrant ship have to be

inspected by a surgeon appointed by government, who will not allow any one to go on board who has any infectious disease of a dangerous character. I passed before him for inspection, which occupied only one or two seconds. He said without drawing breath: "What's your name? Are you well? Hold out your tongue: all right;" and then addressed himself to the next person. We were again all mustered and passed before him on board the ship while sailing down the river.

'There was no regularity or decency observed with regard to taking the passengers on board the ship: men and women were pulled in, any side or end foremost, like so many bundles. I was getting myself in as quickly and dexterously as I could, when I was laid hold of by the legs and pulled in, falling head foremost down upon the deck, and the next man was pulled down upon the top of me. I was some minutes before I recovered my hat, which was crushed as flat as a pancake. The porters, in their treatment of passengers (naturally), look only to getting as much money as they possibly can from them in the shortest space of time, and heap upon them all kinds of filthy and blasphemous abuse, there being no police regulations, and the officers of the ship taking the lead in the ill-treatment of the passengers.

'The *Washington* went out of dock on the 25th [Oct.], and anchored in the river. I went on board on the next day, and witnessed the first occasion of giving out the daily allowance of water to the passengers, in doing which there was no regularity: the whole 900 and odd passengers were called forward at once to receive their water, which was pumped out into their cans from barrels on deck. The serving out of the water was twice capriciously stopped by the mates of the ship, who, during the whole time, without any provocation, cursed and abused, and cuffed and kicked the passengers and their tin cans; and having served out water to about thirty persons, in two separate times, said they would give no more water out till the next morning, and kept their word. I gently remonstrated with one of the mates, who was cuffing and kicking the poor steerage passengers, observing to him that such treatment was highly improper and unmanly, and that he would save himself a great deal of trouble and annoyance, and win, instead of alienating, the hearts of the passengers, if he would avoid foul language and brutal treatment, and use civil treatment, and institute regularity in the serving out of the water, &c.; but he, in reply, said that he would knock me down if I said another word. I was happy to find, however, that my rebuke had the effect of checking for the moment his bullying conduct.

'Provisions were not served out this day, notwithstanding the engagement contained in our contract-tickets, and notwithstanding that all the passengers were now on board, the most of them since yesterday, and had no means of communication with the shore, and that many of them, being very poor, had entirely relied upon the faithful observance of the promises contained in their tickets, the price of which includes payment for the weekly allowance of provisions.

'While a steamer towed the *Washington* down the river on Sunday, 27th October, all the passengers were mustered on deck, and answered to their names as they were called over by the chief clerk of the agency-office at Liverpool. This formality was for the purpose of ascertaining that there was no one on board but such as had tickets. One little boy was found hid, having made his way on board, thinking to escape notice: he was sent ashore. On the 28th we were so fortunate as to have a most favourable breeze, which carried us out of the Irish Channel, being that part of the voyage in which we expected the greatest delay.

'On the 29th I went the round of the lower deck with the surgeon of the ship, observing him take down the numbers in each berth. These berths are constructed

to hold four persons, and would conveniently hold five persons; some of the berths had four persons in them, and some as many as six. I observed that the doctor noted down in many instances persons between the ages of fourteen and sixteen as under fourteen—that is, as not adults, although it is expressly stated in our tickets that fourteen years of age constitutes an adult, and any one above that age is paid for extra as such. This was for the purpose of making a saving in the issuing of provisions, as half rations only are served out to passengers under fourteen years of age. The doctor remarked to me at the time, that as regarded the issuing of provisions, sixteen years of age was considered on board the *Washington* as constituting an adult.

'On the 30th October no provisions had yet been served out, and the complaints of the poorer passengers in the steerage were naturally increasing, as they had no means of living, excepting on the charity of those who had brought extra provisions. [At the request of the passengers Mr Foster drew up a letter to the captain, representing the ill-treatment from want of provisions. This letter, however, only produced a few savage words in reply, and the writer of it was called a rascal and a pirate for interfering. At length, on the 31st of October, provisions were issued; and Mr Foster, on weighing various rations, found them deficient.]

'On Saturday, 2d November, groceries were issued for the first instead of the second time to the passengers: the six persons in my cabin received all their provisions together. We got 6 oz. of tea instead of 12 oz.; nearly our proper allowance of sugar; and 1½ lb. of molasses instead of 3 lbs.; and no vinegar. We have as yet received no pork, though we should have received our second weekly allowance of pork to-day.

'On Thursday, 7th November, flour, biscuits, oatmeal, and rice were issued in the same proportion as before, excepting that the flour was a little under the allowance. I was looking on during nearly the whole of the time, and could see that the quantities were the same to each person. The six persons in my cabin received—8 lbs. of oatmeal instead of 30 lbs.; 8 lbs. of flour instead of 6 lbs.; 8 lbs. of rice instead of 12 lbs.; 8½ lbs. of biscuits instead of 15 lbs.

'On Saturday, the 9th November, an allowance of pork was issued for the first instead of the third time: the six persons in my cabin got 6 lbs. When one of the occupants of berth No. 180 came up for his pork, not knowing that another man from the same berth had just received for the whole of its occupants, the first mate instantly ran at him, and hit him with his clenched fist, and with a rope's end, about the face and head, and then added: "If any other — annoys me, —, I'll smash his head for him!" Whenever provisions are served out, a sailor stands by with a rope's end, and capriciously lays about him, with or without the slightest provocation. The captain never appears to trouble himself in the slightest degree about the passengers, nor even ever to visit the part of the ship occupied by them. The first and second mates, the surgeon, and the man specially appointed to look after the passengers, and the cooks—all these very seldom open their lips without prefacing what they may have to say with horrible oaths.

'I hear occasionally some of the passengers complain to the first mate or to the captain of the favouritism shewn by the passengers' cooks to those who give them money or whisky, and who consequently get five or six meals cooked daily, while those poor passengers who have not the money to give, or who do not give, are kept the whole day waiting to have one meal cooked, or can have only one meal cooked every second day. In my own case, on one of the first mornings of my being on board, the cook took up my kettle of water, which had been waiting one hour and a half to be put on the fire, and said to me: "What are you going to give me to cook that for you?" I replied

that I intended to take my chances the same as the rest of the passengers, and was contented to take my proper turn in having my victuals cooked, for that if I paid for a preference in having them cooked, I should be monopolising a right which is common to us all at the expense of those fellow-passengers who were not able to pay. The cook then put down the kettle again, saying: "That — fellow is not going to pay up, so his kettle may wait." The captain's cook cooks for those passengers who give him 10s. or 12s. each person for the voyage, and a great many do so. I did not, for I wished to place myself as much as I conveniently could in the same position as the general run of my fellow-passengers. I find now, that either in consequence of good words in my favour from some of those passengers whom I have had small opportunities of being of service to, or in consequence of an appreciation of my fairness in taking my proper turns—though I am well able to pay for doing otherwise—or of my aiding him by remonstrances to keep the galley (kitchen) from being too crowded, and to keep order, the cook now favours me as much as if I did pay him. Asked the third mate where we were, and received the same reply as usual—that he could not tell. No one knows the whereabouts of the vessel except the captain and first mate, and they keep that a profound secret from the ship's company and passengers. No groceries were issued, as they should have been this day.

13th November.—I have spoken frequently with different sailors, asking them if this was the first time of their sailing in this ship. All answer yes, and that it will be the last; and some of them express an opinion that the first and second mates will get a good thrashing at New York.

14th.—Provisions of oatmeal, biscuit, flour, and rice, were issued this day as usual. I weighed what was given to four adults and a boy occupying one of the stowage berths. They received 10½ lbs. of oatmeal instead of 22½ lbs. due; 4½ lbs. of biscuits instead of 11½ lbs. due; 4 lbs. of flour instead of 4½ lbs. due; 5½ lbs. of rice instead of 9 lbs. due.

17th.—I heard the doctor say: "There are a hundred cases of dysentery in the ship, which will all turn to cholera; and I swear that I will not go amongst them: if they want medicines, they must come to me!" This morning the first mate took it into his head to play the hose upon the passengers, drenching them from head to foot; the fourth mate did the same a few mornings ago.

18th.—A three-masted vessel in sight, going in the same direction as ourselves; this is the second vessel only that we have seen since leaving Liverpool. About noon a heavy squall came on, which split the fore-top-sail and staysail.

A delicate old man, named John McCorcoran, of berth No. 111, informed me that on Sunday last he had just come on deck, and, after washing, was wringing a pair of stockings, when the first mate gave him such a severe kick as he was stooping, that he threw him down upon the deck.

A passenger, having a family with him, told me that one of the first days after coming on board the doctor applied to him for a present, saying, that of course he was paid for his services to the passengers, but that to those persons who liked to give him anything, of course he should pay more particular attention: the passenger then gave him 2s. 6d. He applied in the same manner to Mr Homer, of cabin No. 8, who gave him 1s. The doctor then said: "And there was that glass of castor oil of the other day, for which you owe me 6d.," which Mr H. then gave him. The doctor has no right to charge for any medicines, but has, I am told, received a great deal of money on board in the same way. The first mate beat one of the sailors severely this evening with a rope.

21st.—A violent gale commenced this evening.

22d.—The gale became perfectly terrific; for a few minutes we all expected momentarily to go to the bottom, for the sea, which was foaming and rolling extremely high, burst upon the deck with a great crash, which made us all believe that some part of the vessel was stove in. The wave rushed down into the lower deck, and I certainly expected every moment to go down. Some of the passengers set to praying; the wind blew a perfect hurricane, so that it was quite out of the question to attempt to proceed on our proper course. We therefore scudded before the wind, having up the main-top-sail close reefed and the fore-top-sail staysail only. The water which had rushed upon the deck remained there to the depth of several feet; it was got rid of by breaking holes in the bulwarks with a hatchet. The whole sea was a sheet of foam. Towards nine p.m. the gale began to be less, though still violent, and moderated during the night.

25th.—Another child, making about twelve in all, died of dysentery from want of proper nourishing food, and was thrown into the sea sewn up, along with a great stone, in a cloth.

We passed some ships' spars this and the following day, belonging perhaps to vessels which may have suffered in the late gale.

26th.—Tea and sugar issued to those who lost any during the late storm. I and my two mess-companions received our allowances together, receiving between us 2 oz. of tea and ½ lb. of sugar.

30th.—The doctor came down to the second cabin in company with the first mate; and to display his authority, drew himself up and swelled himself out excessively tremendous, roaring out: "Now, then, clean and wash out your rooms every one of you!" adding the most horrible oaths.

2d December.—A beautiful day and a favourable breeze; took a pilot on board.

Many of the passengers have, at different times during the voyage, expressed to me their intention of making a public complaint respecting their ill-treatment on board this ship; so, to meet their wishes, I wrote a few lines, which were signed this evening by 128 persons.

3d.—A few of the passengers were taken ashore to the hospital at Staten Island, and we arrived alongside the quay at New York this afternoon. The 900 passengers dispersed as usual among the various fleeing-houses, to be partially or entirely disabled for pursuing their travels into the interior in search of employment.

6th.—I met this day with some friends of mine, who came out two months ago in the *Atlas*, with 415 passengers. They describe the treatment of the passengers on board that vessel by the officers as considerably worse than what I have related respecting the *Washington*.

I have since met with passengers whom I sent out in the *Washington* on her previous voyage, and I learn from them that no provisions were served out during the first fortnight of her voyage, and that no meat was served out during the whole of her voyage: I have also met with passengers whom I sent in the *Wm. Rathbone*, whose treatment by the officers and as regards provisions was similar. It is one of the same line of packets.

Here follows a comparison of the provisions due, and the provisions received by each passenger during our voyage of thirty-seven days, shewing a great deficiency.

The foregoing statement, as has been said, formed the subject of a letter to Lord Hobart, the writer of it remaining in the meanwhile in America. Lord Hobart transmitted Mr Foster's letter to the Colonial Land and Emigration Commissioners, who instituted inquiries at Liverpool through the government emigration officer at that port. The result, as it appears, was—that there could be no redress. Legal proceedings against the captain of the *Washington* at New York had been con-

templated by Mr Foster; but he was dissuaded, on account of the delay and expense of doing so. Under these circumstances, the commissioners apprehend that nothing now can be done until at least the arrival of Mr Foster in England; and even if he should then be prepared to take proceedings against the officers of the ship, it seems very doubtful whether any English court would have jurisdiction in the matter.

Supposing Mr Foster's statement to be correct—and we have seen no cause to doubt its accuracy—it is evident that the humbler class of emigrants on board certain vessels are exposed to the grossest misusage without the slightest practicable remedy in law. On this account the press can but do its duty in spreading a knowledge of the fact, and in recommending emigrants to exercise all reasonable caution in arranging for their passage. One thing more might possibly be done: at each principal port a number of respectable and benevolently-disposed persons might form themselves into an association to investigate the trustworthiness of advertisements addressed to emigrants, and to recommend no emigrant to make an engagement with any shipping concern without previously communicating with the association. Some such organisation might perhaps bring refractory and selfish skippers to their senses.

SNAKES AND SNAKE-CATCHERS.

THE snake with its tail in its mouth, in Egypt a symbol of eternity, is in India a simple fact. In that country the circle embraces both heaven and earth; it sweeps through the whole mythology, from Mahadeo, the god of the Serpent, and Doorga, his consort, decked with coils of snakes instead of chains and jewels, to the hundred-headed snake who bears the lord of the universe, and the monster whose task it is to churn the waters of immortality. This mythological series descends upon the mountains and forests to the north of India, where it becomes the Dhorah—a mighty reptile fifteen feet long, and thick in proportion, which our Old Indian has seen carried on the shoulders of several men in procession. Thence rolls the serpent-fold, in every kind of variety, over the fields and gardens, through the houses, in the bath, in the scullery and store-room, in the very bed, till it comprehends the whole circle of Hindoo life.

Well do I remember, quoth she, the commotion which the finding of a small snake's skin occasioned in our family circle. We children—alas! I was then a child—could not enough admire its transparent texture, the regularity of its scales, and its smooth and glossy appearance; and our wonder increased as we observed how dexterously the skin must have been slipped off, just as Juliet might have withdrawn from her smooth hand the glove that Romeo wished to be. Thus uninjured the shining skin lay before us—a small slit alone indicating where the wearer of this beautiful integument had crept out. After our excitement and admiration had somewhat abated, I perceived my dear old father's countenance become somewhat clouded.

'Miaghan,' cried he at last to the servant in waiting, 'call Hurreckchund Baboo;' an intelligent individual, who was often taken into our cabinet councils, and who was much esteemed for his urbanity and uprightness. 'Well, Baboo,' said my father, as soon as the old man made his appearance, 'do you know that I am harbouring a snake and these children under the same roof?'

'How is that, Sahib?' said the Baboo; 'this must have come to pass very recently.'

'Well, look at this skin; it was found early this morning before the door of our sitting-room. You know we constructed flues last year under the room to render it dry, and put bars before the open cavities to prevent vermin from taking possession of them; and

now I see two of the bars have disappeared—a fact which, taken in connection with the appearance of the skin, is a sufficient proof that a serpent must have got in. I wish you to advise me how to get the intruder captured and killed.'

'Sahib,' replied the Baboo, 'I could do that readily enough; but allow your old servant, a worshipper of Sheeva, to intercede for an animal he holds sacred. I see very well that this is the skin of a kurait, comparatively a harmless snake. It has no stamp of the spectacles on its nose. That snake, Sahib, will prove a good genius: he came to seek your protection, and has laid his skin at your door to tell you so. Take me as bail for once, and rest assured that, instead of doing you harm, he will clear your room of those disgusting toads and frogs which sometimes jump upon your feet at dusk, and will devour the mice which eat Missy Baba's gingerbread, and kill also the musk-rata, of which she has such a horror.'

'Oh, papa!' cried I, looking imploringly in my father's face; 'think of those horrid musk-rata that go shrieking like evil spirits at night through our bedrooms, and spoil everything in our pantry and cellars—even the wine, which is carefully sealed with wax and rosin! Let us by all means leave the serpent alone, to deal with them as he pleases.' My father could not help smiling.

'Well, Baboo,' said he, 'I will for once take your bail, and also allow Christina's eloquent appeal to soften my heart—so let the snake live.'

We neither heard nor saw anything more of the intruder for about twelve months, but found, as the Baboo had prognosticated, a vast diminution in all the vermin kind; when another skin, prettier than the former, but nearly double its size, was found laid upon the same spot. The Baboo was sent for again in a hurry.

'Ah Sahib,' said he, addressing my dear father, 'my good genius, I fear, is now about to take his departure. He is grown restless, and is gone to seek for a partner; and as his old skin was grown painfully tight, he has slipped it off by making a rent on the top of his head. See how ingeniously he has hooked it against that slight roughness on one of those little iron bars.'

'I am glad,' said my father, 'to hear that you think the snake has taken his departure. We shall say no more about him then, and I shall have those bars replaced, to prevent any of his congeners from getting into his lodgings.'

This was done, and snakes were almost forgotten, except at such times as we looked at our pretty cast-off skins, until one morning our poulterer made his appearance with a woful countenance and a low salaam.

'Khodawund,' said he, folding his hands, 'the pigeons will not come down from their perches to-day to eat, and the rabbits have hidden themselves in their hutches.'

'And what is that owing to, my good man?' asked my father.

'Khodawund, I suppose a snake must have frightened them last night, and if you order an investigation, the sheitan' (satan)—for the poulterer was a Mohammedan—'will be found lurking about the premises. Suppose we get a real snake-catcher, and not one of those pagle (mean fellows), with their gourd flutes, and have peace restored in my department?'

'By all means,' replied my father; and a *bona fide* snake-catcher soon made his appearance.

Black as a coal was the skin, frizzled, woolly, and crisp the hair, and flat and ill-favoured the countenance of this Bugdee, obviously a man of the lowest caste. Such countenances are found in all the ancient Hindoo excavations, and they grin and goggle from the shoulders of all the gigantic idols of olden time. The present olive-coloured, straight-haired Hindoo seems to be of a different race from the excavators of the

first temples, and the chisselers of the first graven images.

The snake-catcher came, provided with two implements, which served the same purposes as a spade and crowbar, although of rude manufacture. He seemed to set about his business in a very scientific manner. He inspected the ground all about him very carefully, looked if there were any traces of a creeping thing upon it, pried into every hole he came to, took a little of the earth in the palm of his hand, and even tasted the loam and smelled it. At last having come before a larger hole than we had yet seen, the entrance of which was very smooth, and looked as if some slimy stuff had dried upon it, he paused, and said:

'Sir, here we shall find the snake.'

'What is to be done now?' asked my father.

'We must dig, sir, if you have no objection.'

My father had none, and as he was anxious to have the enemy caught, operations were begun immediately. The hole was considerably widened, and after the man had dug about three feet deep, sure enough an immense gokhoorah (cobra de capella) was seen coiled up.

'Oh,' said the man, 'there he is! I know from his beautiful purple coat, shining scales, and his whole appearance, that he is the dhemorah (the gentleman snake). Now, shall I seize him?'

As soon as he had uttered these words the snake, as if understanding to what his discourse tended, spread out his frightful head, with the well-known marks of spectacles, and made a dart at the man with his beak-like mouth. The Bugdee avoided the dart, watched his opportunity, and seized the snake by the back of the neck, upon which the monster coiled itself in many folds round and round his muscular arm.

'That water-jar—quick, quick!' cried the man. 'This fellow will paralyse my limbs. Away with him into the pot! I may not slay him, for if I did the gods would never allow me to capture another.' The snake disappeared in the pot, the mouth of the vessel was covered firmly with a piece of cloth, and a stone fitted close upon it.

'Now,' said the man, 'we shall dig a little farther, and no doubt discover the female, and find also either her eggs or her young.'

And so it proved. A few strokes with the spade brought the female snake to light. She was of a much paler colour than the male, and not nearly so large. Having had a good feast on the pigeons during the night, she was rather sluggish, and sat brooding upon three eggs almost asleep. The snake-catcher pounced upon her as he did upon the other without much ceremony; and having squeezed her so tightly by the neck as to make her open her jaws, he displayed to us her horrible fangs. The eggs were of a dirty white colour; and upon being broken, they exhibited the same bloodshot appearance as a hen's when they have been sat upon for a time. We had scarcely flattered ourselves with so much success; so the Bugdee was handsomely rewarded, and dismissed, after he had obliterated all the traces of his, to us, wonderful feat.

'And now,' said my father, 'to-morrow, my dear girls, we shall see what those mock snake-catchers can do. The mourgy-wallah (poulterer) will bring us to-morrow one of the ogres with the gourd flutes.'

At ten o'clock, accordingly, the magician made his appearance. I could not but be struck by his savage looks, matted hair, ochre-stained dress, and the hieroglyphics of red and white paint which were neatly and carefully drawn on his forehead and arms. He looked wildly about, and asked if sahib had sent for him.

'To be sure I have,' was the reply: 'but what have you got there?'—pointing to his basket.

He lifted the cover with a curl of the lip. 'An empty basket of course,' was his reply.

'And are you alone?' asked my father again; 'and have you no snakes hidden about you?'

'I despise all human aid,' growled he, raising himself to his full height; 'and as for snakes, examine the fakcer's dress, and be convinced.'

But this was not done, for we saw we had offended the man; and my father contented himself with telling him in a conciliating voice to begin his work. And this was done by blowing a long protracted blast upon his flute, to the music of which we all marched towards the palanquin shed. There we came to a stand-still, and the magician said: 'Here, assuredly, is a snake: will you hear him?' We of course assented, but at the same time laughed at the idea of hearing a snake. Whether the work of ventriloquism or not, however, we certainly did hear something like the tones of the landrail. The man then stooped, took up a handful of dust, and assuming, if possible, a more savage air than he had before displayed, gave out some mysterious incantation which no doubt was in Sanscrit. I shuddered, but could only distinguish the word *bunsauu*, which means 'denizen of the wood.' As soon as this incantation was finished came a sort of 'crick—crick—crick!' The magician now began to wave his body, shake his head, and play on his flute what he fancied a most seductive blast, till, directing our attention to a heap of boards, we did actually see a pair of fiery eyes, and a sharp, forked, protruding tongue. The snake came forth by degrees, and advanced nearer and nearer to the sound of the flute, till his charmer, with great dexterity, seized him, and deposited him in the basket. Two other snakes were caught in nearly the same manner, the last being minus an eye, which of course attracted our notice.

'Snakes,' said the man, 'although they wound and slay other animals, are vulnerable themselves, and, even like man, they have their feuds and their enemies; for instance, the kite, the stork, and the subtle little neulah.'

We allowed him to slip all he captured into his basket, for not a scale of the snakes would he allow to be injured; and having handsomely rewarded him, we gave him leave to depart. Then only our magician became gracious, and he presented my father with a little greenish stone, which he assured him was a sovereign remedy against the bite of the snake.

'And now, sage mohunt,' said my father, 'as you are about to depart for ever, reveal unto us whether this be not all glamour? Have you not in some way contrived to deceive our senses?'

The magician grinned horrible a ghastly smile while he replied: 'If I have, I have done it cleverly; and no one is bound to bear witness against himself.'

We heard the next day that he had been at our missionary minister's, at the schoolmaster's, and at the music-master's, and that at each of the places he had caught three snakes, one of which was always *minus an eye*!

TELEGRAPH OF THOUGHT.

THREE literary productions have been sent to us this week from countries far apart—one from Italy, one from China, and one from New Zealand, which have all, we think, strong claims upon the interest of our readers.

The appearance at Florence of a new Italian journal called the '*Rivista Britannica*,' appears to us to be a circumstance peculiarly worthy the attention of those who watch with interest the social progress of nations.* The object of this journal is to transfuse English thought into the veins of Italian society, with the view of promoting a freer and healthier circulation. The result sought after is not proposed to be obtained by

* *Rivista Britannica*, Giornale Mensuale, raccolta di Articoli tratti dalle migliori pubblicazioni Inglese. Fascicolo I. Firenze: Tipografia Italiana, 1851.—[The British Review, a Monthly Journal, composed of Articles from the best English publications. London Agent, P. Rolandi, Berners Street.]

translating books, but articles—by sending through the Italian mind that common current of reflection and information which is the very life of the English intellect. In the introduction the editors, one bearing an Italian, the other a Scottish name—the Chevalier Sebastiano Fenzi and James Montgomery Stuart—remark, that England alone has been exempt from the almost general fate of Europe—to struggle for freedom—to seem to win the fight for a moment—and then to fall back, having gained nothing more than a shadow. It seems to them that the achievement of liberty is useless without the capacity to enjoy it in an orderly manner; and that the best preparation Italy can make is to study the popular literature of a nation possessing so eminently this capacity, and offering so excellent a *point d'appui* for those who would develop the elements of Italian society.

Under these convictions, they propose that the new journal shall be composed of such translations from English periodicals as will give a faithful reflection of the existing state of art, science, literature, and social life in England; and they invite the sympathy and support of the Italian public to an undertaking which they believe will not only furnish a useful and agreeable volume, but serve to correct prejudices and remove antipathies. Their materials will consist of narratives, articles on physical and natural science, machinery, &c.; travels and geographical sketches, literature and art, &c.; besides an original review of English works relating to Italy. The contents of the first fasciculus now before us are as follows:—'Adventures in the Fiord,' by Harriet Martineau; 'Terrestrial Magnetism,' from Chambers's Edinburgh Journal; 'Foreign Reminiscences of the late Lord Holland,' from the Edinburgh Review; Herschel's 'Siberia and California,' from the Quarterly Review; and a review of Ogilvy's 'Traditions of Tuscany,' in verse, with poetical translations of the extracts.

This undertaking we think is worthy of all encouragement; and we are quite of the opinion expressed by the editors, that a free interchange of thought is still more important than a free commercial intercourse between nations.

The second work alluded to is published at Ningpo. It is of a narrow folio size, neatly stitched as a pamphlet, with a thin cover of yellow silk. It is entitled the 'Philosophical Almanac,' by D. J. Macgowan, M.D., and is printed in Chinese, with numerous diagrams, in the 48th year of the 75th cycle of sixty, or 4488, being the 1st year of the reign of H. I. M. Hien Fung.

The main object of the work is to communicate to the Chinese a knowledge of the principles of the electric telegraph; and as an introduction to the subject—necessary to them—there are added essays on electricity, galvanism, and magnetism. But this indoctrination has no reference to the establishment of an electric communication with Peking; the benefit it seeks is intellectual, not physical; and the fluid of thought it conveys is intended to awaken the Chinese mind from the torpor of ages.

To this ancient people their ancestors are deities, to whom they pay divine honours; and it is necessary to prove to them that in the course of the last 2000 years the world has learned something, and that we of these last days are in some respects wiser than Confucius. This must be the foundation of all teaching in China, where at present it is unlawful for the human mind to advance one jot beyond the wisdom of their ancestors. The decomposing power of the galvanic battery is explained, the author tells us, 'for the purpose of shewing the fallacy of so much of the philosophy and mythology as is connected with the theory of the five elements: reference being also made to facts in astronomy, optics, chemistry, and anatomy, which in like manner scatter to the winds their notions relative to planets, colours, metals, and viscera, of which the

Chinese enumerate five each.' The work, it will be seen, is conceived in a wise and healthy spirit, and if even tolerable in the execution, Dr Macgowan will deserve well of China and of mankind.

The third literary production is the first number of an English newspaper, published under peculiar circumstances at the antipodes. In September last, our readers are aware, four emigrant ships sailed from this country with the view of founding the Canterbury Settlement in New Zealand. It was late in December before these pilgrim fathers arrived at their destination—an uninhabited bay surrounded by a desert; but here, on the 11th of the ensuing month—before twenty human habitations were in existence—appeared the 'Lyttleton Times,' a well-printed paper of twenty-four columns folio, with its page of advertisements, its leading article, its notices to correspondents, its shipping news, its local intelligence, its poets' corner, its market prices, and its police report. Formerly, it used to be said that wherever the English went, the first thing they did was to establish a tavern: now we have changed all that—the chief necessary is a newspaper, and the stirring character of the age demands, above all things, expression. We wish every success to the 'Lyttleton Times,' and to the settlement of which it aspires to be the organ.

CŒUR-DE-LION'S STATUE.

A COLOSSAL EQUESTRIAN BRONZE FIGURE, BY THE SCULPTOR MARCONETTI; NOW PLACED OUTSIDE THE GREAT EXHIBITION IN MYDE PARK.

RICHARD THE LION-HEARTED! crown'd serene
With the true royalty of perfect man;
Seated above the blessing or the ban
Of half-articulate crowds that gaping lean
To trace what the out-of-date word 'king' may mean.
See there! What needs that iron casque's star-rim,
Defined against the sky, to signal him
A monarch—of those monarchs which have been
And are not! Read his mission'd destinies
In the full brow majestic, kingly eyes;
The strong, still hands, each grasping rein or sword;
The mouth in very sternness beautiful;
Behold a man who his own soul can rule!
Lord o'er himself—therefore his brethren's lord.

'O Richard! O mon roi!' So minstrels sighed;
The many-centuried voice dies faint away
In silence of the ages dim and gray.
We know not but those green-wreath'd legends hide
A coarse, foul truth, that soon had crumbling died
Beneath our modern times' serene air.
What matter! Giant statue, rest thou there!
Shadowing our Richard of chivalric pride;
Or if not the true Richard, still the type
Of the old regal glory, fallen, o'er ripe,
To rot amid the world's new blossoming.
Stand! imaging those lost heroic days,
Until our children's children come and gaze,
Whispering with reverent awe: 'This was a king!'

A NICE SUMMER DRINK.

Before my departure from Macon, I supped in the large room of the hotel. I had frequently observed the singular mixtures which many of the Americans make at their meals: I here observed that a gentleman, after calling for a glass of milk, deliberately shook a portion of the contents of the pepper-box into it, and having added a teaspoonful of salt, stirred the whole together, and drank it. There is certainly no accounting for taste, but this, among all the strange compounds which I met with in the United States, was the most extraordinary.—*Colonel Cunyngame's Glimpse at the Western Republic.*

PRICE 1½d.

AN ADVENTURE IN THE WILDS OF ROSS-SHIRE.

Most persons who speak of the Highlands of Scotland are thinking of Perthshire with its Trossachs, Tay-mouth, and Dunkeld, or at the utmost, of Inverness-shire and the Caledonian Canal, which places they may perchance have visited through the help of steamers, coaches, and droskies. These are familiar districts of Great Britain; but there are wilds beyond, which few penetrate—the vast sterile tracts of Western Ross and Sutherlandshire. Besides the English sportsmen whose enthusiasm carries them wherever a wing or a fin is to be seen, few know aught of that region beyond what they may have learned from a casual and indifferent glance at a map. Yet it is the district in which perhaps absolute wildness is the best exemplified in our island. Mountains most grand, inlets deeply intersecting the land, lovely lakes, and wide-stretching moorlands, mingle to form a haunt, one would think, for only the eagle and the roe-deer, but which, nevertheless, contains a large population of sheep and cattle, and also many human beings; more of the latter, indeed, than it is desirable to see in such a situation. The population, however, is in patches, generally where a mountain-skirt of green land is to be found. In many parts you may wander for a whole day and not meet a single person, or see the smoke of a cottage.

Led by curiosity respecting a point in physical geography, or I might more aptly say, superficial geology, I lately found my way past all the usual haunts of the Highland tourist. Loch Alsh and Loch Carron I had left behind as comparatively Lowland and southern districts. A mail car brought me to the head of Loch Maree, and there left me at the extremity, as it were, of civilisation; for it went no farther. Then I passed along the border of Loch Maree by a road only made last year out of the 'Destitution Fund.' A splendid lake it is, bordered by magnificent storm-scarped mountains, the lower regions of which presented me with what I felt to be the first purely natural wood of a picturesque character I had ever seen; and how admirable a thing is such natural wood! So harmonious with the scenery, so just enough and no more, so feathery, so well arranged—I never can again look on a 'plantation' with any patience! Then I came to Gareloch, which is part of the same range of beautiful country. Then to Polewe—a lonely village where fishing is carried on, and where I was induced to have recourse to a boat in order to get farther north. My boat adventure was in itself an odd one; but I must not dwell upon it. Suffice it to state that I was becalmed at sunset on the western ocean, and spent

most of the night in Loch Broom, not reaching Ullapool till four in the morning.

I was now where I had desired to be—in the midst of a range of mountains which has heretofore engaged a good deal of the attention of geologists, on account of the very peculiar circumstances which have evidently attended their formation. From Queenaig in Sutherlandshire, southward, to Applecross in Ross-shire—a space of seventy or eighty miles—this line of mountains extends, each standing wholly apart, and very much separated also from any eminences in the general plateau from which they spring, most of them bold and narrow towards the west and north-west, and more sloping in the opposite direction, and all of them reaching to a height of from 2500 to 3500 feet above the level of the sea. Now the remarkable fact regarding these mountains is, that they are composed of sandstone strata, arranged horizontally, or at a slight inclination to the horizon, so that in their sides and ends they bear the appearance of a Titanic masonry, and one could almost imagine some of them to be enormous cathedrals or castles crumbling into ruin. It is perfectly evident that they are the relics of a sheet of what is called the Old Red Sandstone, which has originally extended over the same space of ground, and all the rest of which has been swept away. It is accordingly a magnificently significant and readily intelligible example of that process known by geologists under the term, *denudation*. The hills are hills of denudation, and the intermediate spaces are valleys of denudation. The most unreflecting pursuer of grouse must be struck by the extraordinary appearances which are thus presented to him. One such person told me that, on first approaching the base of Sool Vean in Assynt, he could hardly resist the belief that he saw before him a lofty building of regular courses of masonry, which had been erected by the hands of some aboriginal race of giants long passed from the earth. Sool Vean rises from a platform of gneiss to a height of nearly 2000 feet, and, in its foreshortened form from the west, I can compare it to nothing but an exaggeration of the Bell-Rock Lighthouse, which narrows from the base to about a third part up the sides, then becomes perpendicular, and ends in a dome-shaped cap.

Near Ullapool there is a grand example of these sandstone mountains, bearing the name of Benmore or the Great Mountain; but as this name is common in the Highlands, it is further distinguished from the district in which it lies as Benmore-Coygath.* One sees it

* This mountain is in a district which politically forms part of Cromartyshire, though detached from the principal part of that county; but in physical geography it may well be considered as part of Western Ross-shire.

rising in a long-extended screen of dark frowning precipice over certain intervening ranges of gray and sterile rock. Having resolved to make an inspection of the mountain, I took a pony to carry me over the six miles intervening between the village and its base. A young man came along with me to take charge of the pony while I should be upon the hill, and I also provided myself with a couple of biscuits and a small quantity of spirits. For my original intention of spending three or four hours on the hill, and then returning to Ullapool to a late dinner, this arrangement would have been sufficient; but I afterwards found that both a guide and a larger stock of provisions would have been necessary. Leaving the pony and its attendant at a shepherd's house near the base of the hill, I commenced ascending at one o'clock, and quickly overmastered some of the frontier ridges, though they were somewhat more troublesome than I had expected. While sheltering myself for a few minutes under a rock from a passing shower, I found myself in close proximity to a ewe which was standing with a gentle watchfulness beside her dead lamb. The little creature had probably fallen from the overhanging cliff and been killed. I thought of the beautiful allusion to such an incident in Scott's poem of 'Helvellyn,' but without imagining that before night I was to run nigh to repeat in my own person the history of the subject of that poem. In the wilderness such little circumstances evoke sympathies for which there appears to be no place amidst the busy haunts of men. Sometimes in clambering along these pathless highlands, where one might almost forget that there is a populous world to be returned to, I have been surprised at the appeal made by even a little wild-flower, when, resting for a moment, the wanderer sees such an object by his side. The wild violet, perhaps, or the harebell—ten thousand chances to one against its ever being seen by human eyes, yet not the less beautiful in consideration of that slight expectancy—not the less exemplifying the wondrous skill of the Maker of the great and the small. The well-known lines of Gray are of course apt to occur at such a sight; but I must confess that my predominant feeling is one of deep interest in the contemplation of the mechanism and business of *life* going on in circumstances which so strikingly mark its independent place in creation. The humblest wild-flower blooms not for man or any other creature as a primary object: it lives and blossoms for itself under the God who made it.

On getting to the rear of the mountain, I soon found myself descending into a deep valley in which lay a series of lakes, and the opposite side of which was formed by an isolated hill of no marked character. I had to descend a precipitous hollow, or *corry*, as it is called in the Highlands, often indebted for progress to the rough heather which grew from the interstices of the rocks. It is a scene of utter desolation; yet here was something which science rendered to me as eloquent as any written history. Curving outwards from the front of the hollow through which I had descended were two great ramparts or ridges of loose stones, one smaller than and within the other. Some acquaintance with the Swiss Alps enabled me at once to detect that these were *moraines*—examples, namely, of the bands of debris which glaciers bring down from the mountains, and leave encircling their own terminations. The climate is not such now as to produce a glacier in the *corry* which I have described, but it

had once been so; and here were the loads of rubbish which that glacier had deposited at its skirts—first the outer and larger being for a long period its limit, and then for a shorter period the inner and smaller. Such curious memorials of a past state of things are to be found in various parts of the Highlands; but they are not common.

Under the impulse of curiosity I extended my walk round the isolated hill, and then began to cross back through the valley, intending to shorten my walk by passing over the ridge of Benmore at one of its lowest points, and so returning to the shepherd's house. But I had now expended a considerable portion of my strength, and its renewal was not to be looked for, as by this time my stock of provisions had been exhausted. To ascend, therefore, a rough steep *corry* of about eight hundred feet in height was a severe task. With dreadful toil, and after many pauses, I did attain the summit, when to my surprise, instead of looking down the other side of a ridge as I had expected, I found myself on a table-land of heath and moss, over which the wind swept with unobstructed keenness. It was like one of those strange transitions effected by magic in the 'Arabian Nights' Entertainments, and for some time I was totally unable to account for it. At length I apprehended that Benmore, instead of being one simple ridge, is a triangular piece of table-land with two precipitous fronts. I swiftly traversed the upland moor, and bending towards the left, came in about half an hour to the brink of what I believed to be the opposite precipice, although in the scenery below I vainly endeavoured to recognise the country which I had left at mid-day. With great difficulty I descended a rough *corry* for four or five hundred feet, and then became aware that I had made a mistake, and was only returning to the valley at the back of the hill. It was now between six and seven o'clock, and my strength was much diminished; yet as there was nothing else to depend upon for getting home, an exertion must be made. With incredible pain I reascended the mountain, and was once more upon the table-land, the form of which, by the aid of my pocket compass, I now understood. Feeling unfit to encounter any more ascents, I declined an adjacent hollow in the summit which might have given a straighter way home, and walked for about a couple of miles along the moor in order to turn the flank of the mountain; thus at length completing my original design. At that point there was a splendid look-out upon the outer portions of Loch Broom and its many islands, over which the sun was beginning to go down; but no habitation met my eye: I had still the sense of being far from human aid and succour. There was in view, indeed, a portion of the bay beside which I remembered the shepherd's house was situated, but it was evidently some miles distant; and behold the intervening country was composed of huge longitudinal hills, only inferior to the mighty Benmore itself—a circumstance for which I was totally unprepared, as I had not thought that these ridges extended so far. I may here mention, that during the whole day I had never met or caught a glimpse of any human being. The district is merely a sheep-walk, over which it is not possible for even the shepherds to pass very frequently; and I think I was told that, for some particular reason, none of them had that day been abroad upon the hill.

I now began to feel that the circumstances were of a critical nature, and repented the imprudence of venturing alone and so ill-provided into such a desert. But for these uncomfortable reflections, the situation was one well calculated to excite admiration. I was now on the talus of debris under the black seamy cliffs of the finest side of this stupendous mountain. It stretched for several miles along, a grand bulwark of nature, marked with the tear and wear of elemental wars during numberless ages. In front lay a long gray hill, the surface of which was composed of large sheets of

smooth abraded rock, interspersed with a meagre vegetation. In the distance lay Ben Goalish and the other mountains of the two Loch Brooms, a scene of unbroken sterility and grandeur; while it was just possible in the middle ground to obtain a peep of the softer scenery around that bay to which I would so fain have returned. For some time I passed along the sheep-tracks on the face of the mountain, descending occasionally from one to another, till at length it occurred to me that I might fail to surmount the frontier hills, and that it was best to try to turn their flanks by keeping near the sea. I therefore left the front of Benmore proper, and, crossing the stream in the trough or valley below, passed obliquely up the opposite ridge. In due time I came to the extremity near the sea, but found it appallingly steep and apparently impassable. I was on the verge of a precipice, all but impending over the restless element, which, even on this comparatively calm night, kept up a continual roar below. In the state of exhaustion to which I was reduced, and the desperate aspect which the case was assuming, I felt for a moment that to have fallen over these cliffs and been at rest in the bosom of the deep would have been less of a calamity than such an event usually appears. At this crisis, however, a ray of hope shone forth, for I espied a small footpath passing along the face of the cliff underneath. A footpath must lead from one human haunt to another. In one direction it would probably take me to the shepherd's hut.

By this time it was half-past eight o'clock, and I felt an attenuation and languor not to be described. It may here be explained that walking over such a district is a very different kind of exertion from that of promenading in a street or a country road. From the roughness of the ground, it is necessary to leap, to clamber, to slide, and thus the whole system is strained and shaken to a degree which in a few hours tells severely upon it. Under such violent exercise, perspiration streams from the body, and drops from the hair and eyebrows. Having now been in this state for several hours, with a superaddition of excitement arising from anxiety, I felt as on the borders of a fever. What helped to strengthen this impression was the raging thirst which I experienced. At every one of the numerous rills of pure water which crossed my path, I took two or three handfuls, and yet the drought was never in the least quenched. I recollect at that time collecting a few crumbs from my satchel and trying to eat them, when it appeared as if the salivary glands had been utterly dried up, for the bolus remained dry and unswallowable in my mouth until I obtained a little water to slake it.

By doubling back a little way—how hard a doubling back appears at such a time!—I reached the footpath, which proved one of fearful difficulty, sometimes passing up little precipices, sometimes crossing little morasses, almost always ascending, for it soon appeared that much high ground was still to be passed over. I was now able to walk only forty or fifty yards at a time. At the end of every such space, I lay down, or involuntarily tumbled down on the heath, and remained there a few minutes to recover breath and strength. Twice or thrice a flash of sleep, as I may call it, passed over my exhausted powers, each having its little momentary dream; a phenomenon very interesting, but also very alarming, as to have fallen completely asleep in such circumstances would probably have been fatal. I remember reflecting at one of those intervals of rest, of what value would have been a bottle of wine and a biscuit—how much even a bowl of milk would have been worth! I felt too that, if a bottle of wine could have been obtained, the first impulse of nature would have been to drink it off at one draught. Some large portion of one's entire means in life might willingly have been rendered for one of those

refreshing succours. It is when thus thrown forth from the social scene, and left exposed to the merciless energies of physical nature, that man feels how weak he absolutely is, and how, without some ultimate trust in the Almighty source of his being, that being is but as a straw upon a whirlpool. I am unwilling to treat my adventure in an exaggerating spirit; it was, after all, perhaps, only remarkable as an unusual occurrence in the life of one accustomed to dwell amidst the comforts of the highest civilisation. But since I am relating it to all, I feel that I ought not to suppress some reference to the solemn feelings which passed through my breast while running what I believed to be a risk of tragical death.

The adventure occurring near the summer solstice, and in the fifty-eighth parallel of latitude, the sun fortunately kept above the horizon till about nine o'clock. At a different season of the year, darkness supervening at an earlier hour, I certainly could not have escaped. It was now past nine, and the light was beginning to wane—an addition of no small magnitude to my anxieties, but at the same time a stimulus to the jaded faculties. It was at this time that, casting my eyes over the gray rocks everywhere surrounding me, a curious deception of vision for a moment occurred. Methought I saw two human figures standing motionless on the hill above me. They seemed like a man and his wife, and appeared to gaze calmly down upon me. It was but for a moment that this appearance lasted; but it was vivid enough to make me renew my gaze at the spot, to ascertain if there really were any living beings so near me. In the excited feeling of the moment, my mind reverted to superstitious tales which speak of the spirits of those who may be presumed to feel the greatest interest in us, making an appearance before us at times of extraordinary peril. On a searching examination of the spot, it quickly appeared that the figures were merely the effect of some peculiar form and colouring of the cliffs. The footpath, after being twice or thrice lost in bogs of fresh vegetation, or over crags where I failed to mark its course, became finally untraceable, and I had then to move as I best could over ground encumbered with large blocks and masses of moss, guided only by my general sense of the form of the country. I thought I could not then be far from the desired place of rest, but feared to believe it, knowing how apt a stranger is to be deceived in his estimates of a hitherto untrodden district. At length, on succeeding with great difficulty in surmounting a considerable steep, I attained the face of the hill, whence I could see the shepherd's house below. My troubles were at an end. I reached the door of that humble mansion at precisely ten o'clock, having been engaged in violent exercise, without adequate support to the system, for fully nine hours.

I found that the man had gone home with the pony in despair of my taking that mode of returning; but the shepherd and his wife proved as ministering angels. They gave me food and rest, with every demonstration of sympathising kindness, and sent me home to Ullapool next morning greatly recruited, though I did not feel quite recovered for three days. My worthy hostess at the village had been in such concern for me, that she was about to have had a search instituted, when fortunately my reappearance saved her the trouble.

Some years ago, when rambling with a few geological friends in North Wales, I used to join in the laugh at the Snowdon guides, who were sure to ply you with what they called 'frightful examples' of the danger of ascending that mountain without a guide. But I begin to think that frightful examples are not quite to be laughed at. I am also beginning to suspect that geology is a somewhat rough study for a gentleman on the borders of fifty, and that I must leave it to younger men, and look with more respect upon the quiet walk or safe fireside. There must first, however, be some

explication of the discoveries which this and similar rambles have enabled me to make respecting an agent which has powerfully affected the face of the earth in former times.

R. C.

A WORD ON PIANOFORTES.

The pianoforte is the most popular musical instrument of the day. The facility with which a very respectable amount of skill in performing upon it may be attained, and its admirable adaptation for an accompaniment to the human voice, have contributed to render it a general favourite. It is to be regretted, however, that much ignorance prevails with regard to the constitution of a piece of mechanism now so generally to be met with in our domestic circles, and that so little caution or judgment is exercised in the selection, and so little care in the treatment of it. From what we observe in the houses of our friends and neighbours, or wherever we go to enjoy a musical treat, we see that information on the subject is almost universally wanting, and that a serious waste of money is continually occurring from heedless precipitancy in the purchase and subsequent neglect in the treatment of pianofortes. With the view of obviating these evils, in some degree at least, the following few facts and suggestions are submitted to the consideration of all whom they may concern.

And first, as to the choice of an instrument for family use.—There is no question that the grand piano, both in regard to durability and power, is at present the most perfect form of the instrument. Taking into consideration the actual cost of manufacture, it ought also to be relatively the cheapest, instead of being, as it is, the dearest instrument. The high price, with the shamefully enormous profits it includes, is only maintained through the limited demand—a demand which is never likely to become very general, owing to want of space in our dwellings for the convenient stowage of a mass pre-eminently unwieldy and unsightly, notwithstanding all the artistic talent that has been put in requisition for its ornamentation. The upright piano, under which term may be included all sizes, from the tall cabinet to the dwarf piccolo, is fast superseding both the grand and the square for family use; and in consequence of the increased demand, more improvements have been made in the manufacture of instruments of this description than in any others. But whatever description of instrument may be chosen, considerable caution is necessary, especially if economy is to be kept in view, in making the purchase. There are certain well-known names which have stood high in the profession for many years, and if the intending purchaser have not sufficient judgment of his own, and no friend upon whose judgment he can rely, he cannot do very wrong in purchasing of one of these long-established firms, with whom it may be said with some degree of truth, that a bad instrument is the exception, and not the rule. But in this case he will inevitably pay for his own satisfaction the price which the makers set upon their reputation, *plus* the value of the instrument. But it is by no means the case that all the skill in the manufacture of pianofortes is monopolised by the great names. Admirable instruments are daily put forth by men of small repute, quite equal in all imaginable respects to those of the most renowned manufacturers, and which may be bought by those who have skill to select at a fair and reasonable price, yet yielding a good profit to the makers.

As a general rule, a piano for family use should be one of the simplest construction. If it be constructed on sound mechanical principles, it ought to be strong enough to bear the tension of a good thick wire throughout, without the cumbrous addition of steel bars and plates of metal, and hollow copper tubes, such

additions being for the most part nothing better than so many costly catchpennies, which serve the double purpose of enhancing the price of the article and cloaking the ignorance of the manufacturer, who is not unfrequently driven to have recourse to them from a deficiency in knowledge of the true principles of his art. For domestic use a piano of moderately crisp touch is to be preferred—not one offering no resistance to the finger, by the use of which a slovenly and ineffective style of performance would be engendered, nor one on the other hand that demands a momentum of five or six pounds per key to elicit the full force of the note. The present practice of banging upon the key-board with a vigour which would astonish a pauper engaged in the comparatively easy occupation of breaking stones upon the road, has compelled the manufacturers to protect the reputation of their instruments by mechanically diminishing, by the operation of various contrivances, the momentum of the hammer which strikes the string. A 'brilliant finger' is no longer the desideratum with a performer it once was; the united force of arms and shoulders is brought into play; the rigidly distended digits are displayed aloft and dashed down upon the keys with a savage furor altogether out of keeping with the sentiment of music and song; and all the while the enthusiastic performer imagines that by the display of such antics, and the cost of so much perspiration, he is eliciting the fine qualities of his instrument, and never dreaming that his superfluous labour is wasted in overcoming the resistance of so much lead or leverage, which the manufacturer has erected as a barrier to his destructive propensities. How far this senseless system is to be carried there is no saying, or whether it will be thought necessary by and by for a young lady to go through a course of gymnastics as a previous qualification for the study of music, or a little preparatory exercise at a blacksmith's anvil. One thing is certain—the manufacturers have the best of the rivalry, and can, if they like, adapt their pianos to the fisticuffs of an Amazon without the additional cost of a single sixpence.

With regard to the tone of the instrument to be selected for purchase, any written instruction would be of little service. To tone, in the proper sense of the term, the pianoforte indeed has no claim. In this respect an experienced ear is the best guide; and the taste of the purchaser, who should be aware that loudness is not always the best quality, may influence the selection.

There is one thing yet to be said with regard to the purchase of a pianoforte, and that is, that it should be made with the maker himself, or with some well-known respectable and accredited agent of the maker. It is not generally known that something precisely analogous to the copying of pictures, and palming them off as originals, is carried on upon a large scale in the manufacture of cheap and so-called second-hand pianos. Copies of instruments bearing the names of the first-rate manufacturers, put together by men out of work, or unwilling to work at journey-work, are planted about in all directions, as well in the metropolis as in other large towns. Drapers, hatters, hosiers, gloves, hairdressers, milliners, and a host of others, have pianos to sell—the property of a lady who has left town, and a vast number of middlemen, who advertise daily in the London papers, drive a thriving trade by the sale of false and spurious pianofortes, made by untaught bunglers at the cost of from £10 to £15, and sold at a profit of cent. per cent. as the second-hand goods of the most eminent manufacturers. Some of these middlemen in a large way of business assume a very high standing, and affect the pretensions of unquestionable integrity—giving warranties with their goods, the only advantage of which is that at the end of six months, if not satisfied, you may change a bad bargain for a worse. Cabinet-makers, too, have taken to

the construction, or rather to the metamorphosis of pianos, in the hands of one of whom the writer saw not long ago one of Collard's 'Pianos for the People' undergoing the process of investiture in a new garb of rosewood and carving, preparatory to sale as one of that maker's most finished productions. From such facts as these, with which one might fill a sheet, the reader will perceive that his best protection against fraud and sophistication is to have recourse at once to the maker or his accredited agent for the purchase of a genuine instrument.

But supposing the piano wisely selected, bought, and safely housed at home, the next thing is the question of its treatment; and here the greatest ignorance appears practically to prevail. Wherever one goes he sees the piano exposed to a thorough draught, or if not, its exemption is the effect of accident rather than of design. The worst, and unfortunately the most favourite position, is opposite the fireplace, and in the track of the constant draught between the door and windows. Every fresh current of moist air carries the cause of rust to the metal, and through the expansion and contraction consequent upon an ever-varying temperature, the strings are never in tune long together. Again, the leather and buffing, by being alternately wet and dry, become hard in the course of time, even when not used at all. This is not the worst: through the shrinking that follows the hardening of the leather, a destructive friction ensues, which, in spite of the black-lead used to guard against it, wears away the substance of the leather at the lower end of the 'stickers,' or conducting-rods, where, in upright instruments, these rest upon the 'hopper,' and a dismal sound like the rattling of dry bones is very speedily the consequence, forming no very agreeable accompaniment to the performer whenever he or she sits down to play, though it may be inaudible to others at a distance. This uncomfortable sound is due to the shrinking and wearing away of the leather from friction, in consequence of which the communication is broken between the key and the hammer which strikes the strings—the hopper having to traverse the space lost through shrinking and wear, and striking the lower end of the conducting-rod with an audible blow. The buffing or baize, moreover, upon which the keys rest, also shrinks and hardens from the same causes, and thus it frequently happens that an instrument which is hardly used at all becomes unfit for use through the ignorance or negligence of the owner. Other injuries of a similar nature ensue from the same causes, which it is not necessary to mention here. It is true all this would occur in the course of years under the best management, and even with the best instruments; but in careless hands this inevitable deterioration will be accomplished in fewer months than it would in years of prudent care. The best place, then, for the piano in the parlour or drawing-room is assuredly somewhere away from the current of air that runs constantly from the door to the window. In a recess on either side of the fireplace, or against the wall fronting the windows, or in some position the least liable to atmospheric currents, is the best place, as well for the instrument as for the performer.

An instrument that will keep in tune is, however, after all, the grand desideratum. This, in the present state of our knowledge on the subject, is unattainable; although an approach to something like it may be secured by the exercise of a little care and prudent expenditure in the outset. All who have paid any attention to the phenomena of strained steel wires know that there is a tendency in a wire which has long been strained to a certain pitch to remain at that pitch, and even to return to it, or towards it, if suddenly altered. Thus if you tune a wire sharper than it should be—say a quarter of a note, by way of experiment, and keep it up to that pitch for a fortnight, and

then let it suddenly down the quarter of a note, it will again grow sharper in the course of twenty-four hours, as though striving to regain its lost note. Now here is a hint for the treatment of pianos, and one which the writer has followed repeatedly with advantage. It appears plain enough, from the principle here suggested, that if a piano were well and regularly tuned for the first year or two—say every month, or oftener, for the first year and a half—it would acquire a tendency to remain in tune, and behave better in that respect ever afterwards than if no such care were taken. This may appear somewhat fanciful, but it has been shown by experience to be true. Of course this treatment would not prevent an instrument from being affected by sudden variations of temperature, though it would in a considerable degree modify the effects of such variations. Among professional tuners of pianofortes, the man who gets through his work correctly in the shortest time is generally to be preferred. An instrument which is long under the operation of tuning is not the likeliest to remain long in tune. The best tuners tune 'hard,' as it is technically called—that is, with a smart stroke upon every key, and drawing the wire at once up to the required pitch, making little alteration afterwards. It would be well if Lord Stanhope's principle of tuning were generally followed, by which the 'wolf' is equally distributed throughout the scale. The result is extremely agreeable and pleasant to the ear, though the effect of some music is very much altered by it—the distinguishing characteristics of the several sharp and flat keys being thereby in a great measure done away. It is not usual, however, to meet with a tuner who will trouble himself with Lord Stanhope's plan, and still less so to find one who succeeds in the attempt, if induced to make it.

It is greatly to be regretted that pianos are as yet far too expensive for general use among the humbler classes. With the present mode of manufacture there seems no immediate prospect of improvement in this particular. As yet every part of the mechanism, as well as the exterior fabric, is made by hand, and then put together by finishers, who work for high wages, and spend an immense amount of time, pretty much at their own discretion, in chipping, shaving, adjusting, and regulating, to apparently very little purpose; the major part of which tedious and expensive ceremony might be abolished, at least in the production of instruments for popular use, by the adoption of a simple uniform plan of construction, carried out with the precision which the use of machinery in the fabrication of the different parts would ensure. But the magic power of machinery has never yet been brought to bear upon this department of manufacture; and the wonder is, seeing that large and princely fortunes are annually made through the great and increasing demand for these instruments, that such is the case. There seems no reason why a pianoforte should not be as cheap as a clock. The mechanism of the one ought not to be more expensive than that of the other; and the adjustment and regulation of both are perhaps of about equal difficulty. The great cause of the difference in the cost of the two is doubtless that while the clock is made very much by the means of machinery, the piano is entirely the produce of manual labour.

In connection with pianofortes, a word or two may be allowed in regard to the despised old harpsichords, thousands of which are yet extant, and are occasionally offered for sale at prices less than the value of the cases that contain them. Let their possessors pause before they deliver them to be broken up: it is not generally known that they may be converted into charming instruments at the cost of a few shillings, and the exercise of a little ingenuity and labour. The following extract from the writer's musical experience may be of use to some possessor of a harpsichord disposed to repeat his experiment.

A quarter of a century ago, having an old harpsichord in my chamber, I resolved, at the suggestion of a friend, to convert it if possible into a sustaining instrument for the performance of slow music. This intention was accomplished in the following manner:—By means of a common treddle, somewhat similar to that of the travelling knife-grinder, and, like that, worked by one foot, a stout silken thread was made to revolve round the whole of the strings horizontally. This thread had been previously well soaked in resin dissolved in spirits of wine, and thus qualified to act as does the bow of a violin upon the strings. It must be remembered, that in the harpsichord the two strings which are in unison are throughout separated by wider spaces than the other—just the reverse of what is the case with pianofortes. This wide interval gives room for the 'jacks' to play up and down; and each jack being furnished with a slip of quill on either side, twangs both the strings in unison as it rises from the pressure of the key. Having cut away the quills from the jacks, I made a small inverted arch in the top of each, large enough to allow of the revolution of a small brass wheel about the diameter of a pen, and grooved at the edge for the reception of the silk thread. The wheels were turned from a stair-rod by a watchmaker for a trifling charge; and the axles upon which they revolved were short stout needles inserted in holes carefully drilled through the centres of the sides of the arches. By this contrivance, whenever the jack rose by the touch of the finger on the key, the small wheel rose between the strings, and pressed the resined thread (revolving horizontally by the action of the treddle) against both the strings, producing a tone resembling nothing so much as that of the *Æolian* harp, and capable of increase or diminution by the sole pressure of the finger on the key. It answered admirably for very slow music, but hung fire so much that any attempt at a moderately-rapid passage produced no sound at all. For chants and andante movements it was well adapted; and when it passed out of my keeping on my leaving England, it made the tour of the country in company with a travelling exhibition, where, being played behind the curtain, it was the source of no little speculation to the public. It may be only right to mention, that owing to the string being necessarily kept rather tight to insure its revolution, there was constant danger of breaking it by touching too many notes at a time; but this danger might be obviated at the present moment by the use of an elastic string of vulcanised caoutchouc spun with cotton or silk. Such an instrument would of course be entirely unsuitable for general practice, but for persons advanced in life, or for mechanics with joints stiffened by hard labour, and with but little time for the practice of music, it might prove a pleasant and useful companion, especially as but very little skill is required to make it 'discourse most eloquent music.'

OTTERTON COTTAGE.

IN a picturesque Devonshire village, situated on the banks of the river Otter—which, after playing all sorts of vagaries hereabouts, quietly debouches into the sea at a few miles' distance—resided, some score of years ago, an elderly gentleman named Borradaile, with his wife and daughter. Otterton Cottage, Mr Borradaile's abode, was the mansion of the neighbourhood. Highly ornamented both within and without, it arrested the gaze of the passer-by, who, according to taste, viewed it with an air of approbation or otherwise. The simple country-folks pronounced it a 'rare fine place,' and Madam Borradaile a 'rare fine lady;' and they spoke the truth, for both the domain and its mistress were as fine and full of pretension, lacking real merit, as unskilful hands and foolish heads could make them. Sweet Lucy Borradaile was very fond of her home,

though she by no means admired it; and being a pretty girl of twenty, and moreover an only child, it may be supposed that she was much indulged and petted. She was, indeed, her worthy father's darling and delight; and well did Lucy repay his affection by her dutiful conduct and forbearance: for Mrs Borradaile was her step-mother, and not more than fifteen years Lucy's senior. It was to this lady's love of show and decoration that Otterton Cottage owed its flaunting appendages: she having a weakness for everything that seemed to her to savour of gentility, and an unwearied desire to approach patrician usages and patrician society in general.

She had been married to Mr Borradaile for ten years, and was still a really attractive woman, and would have been yet more so, had not a mincing gait and studied manner, meant to be particularly easy, detracted from her charms. Her little fortune of five hundred pounds had been safely lodged at the local bank by Mr Borradaile, when he made the winsome Nelly Peel his second wife; but to hear Nelly talk of 'her fortune'—it was under her own especial control and at her absolute disposal—one would have imagined that twice five thousand at least was in the bank. However, Mrs Borradaile romanced about 'my own money'—and a marvellous long way it must have gone certainly to procure so many substantial luxuries and comforts of all descriptions; and if Mr Borradaile ever refused to gratify any whim or caprice—which, kind soul! was rare indeed—then Mrs Borradaile whimperingly declared: 'it was hard, with her fortune, that she could not do as she liked.'

'Your fortune, Nelly, my dear!' would her husband good-humouredly exclaim: 'why sure it has a wondrous power of stretching itself out, or it would have all disappeared long ago.' But the point was gained, and the five hundred pounds continued safely deposited in its accustomed place; for all Mrs Borradaile's wants were supplied with a liberal hand.

Mr Borradaile had made his money in trade—a circumstance which his wife could endure no allusion to. Her deceased father had been a Lieutenant in a marching regiment, and she once had danced in the same room with an earl's daughter! No wonder Mrs Borradaile boasted her aristocratic reminiscences! Lucy was a patient listener, and if she smiled, it was in a kindly way at her stepmother's foible; for Lucy had learned by heart the blessed lesson of true Christian charity, and was always anxious to hide the bad qualities of others under the shadow of their good qualities. Nevertheless, Lucy Borradaile was sorely tried; for she had a certain dear Cousin Charles, who was in a mercantile house in London, and sometimes ran down to Devon to visit his relatives, and to him, and to his cousinly attentions to Lucy, Mrs Borradaile had a decided antipathy. 'He was of low origin,' the aspiring lady said, 'besides being poor.'

'But, my dear,' replied her spouse, 'Charles is my nephew, and a good, honest, industrious fellow.'

'But not a fit husband for your daughter, Mr Borradaile, I presume,' responded Nelly, tossing her head. 'She might look higher, I should think.'

'Well, well, Nelly, perhaps so,' dubiously answered Mr Borradaile, scratching his bald pate in an absent manner; 'perhaps so—but Charlie is a fine, good lad, nevertheless.'

Mr Borradaile strongly leaned towards his nephew; nor was he blind to the mutual attachment of the young folks; but there was time enough; and Lucy was a decided belle; and she herself might change her mind, and look higher too. He reasoned thus, because his wife badgered him about Charles; for he was an easy man, and desired peace and quietness above all things. When Charles came to Otterton Cottage, Mrs Borradaile assumed all the airs and graces of a theatrical queen on the barn-floor—talked at him, patronised him, or else was absolutely rude.

But Charles bore all with smiling good-humour, which only tended to provoke the lady to wilder flights.

'I really wish, my dear Mr Borradaile,' said his wife one evening when they were alone, Lucy having gone to drink tea at the vicarage—'I really do wish, for Lucy's sake, that you would exert yourself, as I am so often asking you to do, and write to this niece of yours, the Honourable Mrs Ivor, and ask her to come and see you during the summer months. Then, in all probability, she would ask us back again to Ivor Lodge, or to B—Square; and consider the immense advantages such an invitation would combine—such an introduction into high society! Oh dear me! I declare it puts me all in a flutter to think of it. Now, do, my dear, write to the Honourable Mrs Ivor at once. She is your niece, and a deal more worth paying attention to than that stupid, vulgar Charles Worthington.'

'Charles is neither vulgar nor stupid, Mrs Borradaile, I beg leave to say,' replied Mr Borradaile angrily; 'and I won't allow him to be called so by anybody. And as to my niece, whom I have never seen—this Honourable Mrs Ivor—if report speaks true, she is an extravagant, flippant creature, not worthy to be named in a breath with Charlie—the honest, fine lad. Besides, you know as well as I do, that if I were fool enough to write, she wouldn't take any notice; for depend upon it she has been taught to be ashamed of having an uncle in trade; for her father's family were as silly as they were proud.'

'But you are not in trade now, Mr B.,' replied his wife; 'and I'm sure if the Honourable Mrs Ivor came here and saw—"me" she was going to say, but "Otterton Cottage" was substituted—"and saw Otterton Cottage, she would be delighted with its elegance, and not ashamed to claim relationship with the owners.'

'My dear Nelly, you talk like a foolish woman,' said Mr Borradaile peevishly, for he was tired of the incessant boring about this 'honourable' niece. 'Rest assured that Mrs Ivor is far too immersed in her own concerns, in gaiety and fashion, to bestow a second thought on her Devonshire relatives or their elegances. Why it was only the other day that you read an account in the papers of a magnificent fête she gave at Ivor Lodge; and how can you be such a goose as to suppose she would care about this poor place?'

'Ay, ay, it's all very well, Mr B.,' persevered the lady; 'but didn't I read soon afterwards that report said she was in debt and involved? for we didn't doubt that "I," and the stars after it, signified "Ivor," and she a widow too.'

'Well, poor thing, I hope not,' replied Mr Borradaile; 'for she has a noble jointure, though indeed I fear she is a careless one. But I have been told she has a kind heart, although nurtured in a bad school. Don't let us talk about her any more.'

But this command, often repeated after such conversations as the foregoing, was never attended to; and Mrs Borradaile continued to talk of the Honourable Mrs Ivor, and to worry her husband on all occasions, until at length he began to give way, and promised that if she would behave well to Charlie he would 'think about penning a letter to his unknown niece.' He kept his promise; thought about it for many weeks; fidgetted himself almost into a fever, but accomplished the heavy task imposed, and despatched a clearly-written missive to the honourable lady, introducing himself to her notice, mentioning his wife and child—the latter with fond affection and pride—and concluding with the assurance of a hospitable and cordial welcome to Otterton Cottage whenever she liked to come and make acquaintance with her mother's brother. It was a manly, good letter, and no one could have read it without being convinced of the single-hearted benevolence of the honest writer.

Mrs Ivor was the child of Mr Borradaile's only sister,

who had eloped from a boarding-school with the penniless cadet of a noble family: the young wife did not survive the birth of their child, which was taken charge of by its father's offended parents in consideration of the poor baby's desolate state; and their son being compelled to join his regiment abroad, fell a victim soon after to the climate.

Her mother's brother, her only maternal relative, was not permitted to hold any intercourse with Julia de Vere—such intercourse would have been contamination to the De Veres of Vere Hall! At an extremely tender age Julia was espoused to the Honourable Mr Ivor—a wealthy scion of a wealthy race—and found herself a rich, young, and well-looking widow ere she had completed her twenty-fourth year. Rumour had made free with her name; and though no disgrace attached to it, yet that she was a most flighty and extravagant woman of fashion there could be no doubt. But then she was an honourable, and a woman of fashion! Talismanic words to Mrs Borradaile! To be able to speak of 'our niece the Honourable Mrs Ivor' was the delight of her life; to be able to speak to her would be the summit of human felicity! With a beating heart she accompanied Mr Borradaile to the post-office, and witnessed the important letter dropped in its appointed receptacle.

'When will an answer arrive, and what will it be?' she mentally ejaculated. 'If she does agree to come, we must have a new French bedstead in the spare room. And, let me see, pink silk drapery, relieved by soft white muslin, will be the thing; and a toilet-table to match.' And, deep in cogitation concerning suchlike weighty matters, Mrs Borradaile returned home in unusual silence.

But many weeks passed over, and the golden grain waved, and the mellow fruits were ripe, and still no letter came in reply; but Nelly declared 'she did not despair.' Mrs Ivor was doubtless so much engaged that she had not a moment to answer her uncle's epistle. It had been a prolonged 'season' they knew from the public prints; but Mrs Ivor would migrate like the rest of her class, and why might she not turn her steps towards Devon? So Mrs Borradaile lived on hope; and hope in this case, though long deferred, proved more substantial than usual.

A letter was delivered to Mr Borradaile one fine morning when he was at breakfast, sealed with the Ivor crest, written in a cramped hand, but couched in pleasant terms, bearing the signature of Julia Ivor. Mrs Borradaile was in raptures, for the honourable lady declared that she had long been solicitous of making their acquaintance; and concluded by telling her 'dear uncle,' that in a week's time from that day she would be with them at Otterton Cottage, and sojourn for such a period as her numerous engagements permitted. No possibility now, alas! of preparing the new French couch, with its pink silk and white muslin draperies! What a bustle and confusion prevailed in the cottage for the next few days!—what a state of restless excitement Mrs Borradaile was in! 'How would Mrs Ivor come? Of course in a travelling chariot-and-four! Where were they to accommodate her retinue? How were they to amuse the gay lady?'

The momentous time arrived, and to the astonishment of everybody the great lady not only was punctual, but made her appearance in a humble hired chariot and pair, without even a female attendant. Yet to make amends for this apparent want of state, her personal equipments were extremely dazzling—bright colours, jewels, drooping feathers, and satin sheen, not being quite in keeping with the faded vehicle from which she alighted. She was a tall, slight woman, with delicate features, and a pair of small prying black eyes, which, with inquisitive avidity, wandered 'here, there, and everywhere,' unceasingly. She was evidently desirous of making a favourable impression; and there was a

flutter of feather and flounces, and a curtsying and a speechifying, which betrayed the requisite emotion; but when, with what Mrs Borradaile termed 'high-bred nonchalance,' she threw herself on a sofa, applying a scent-bottle to her nose, it was with an air of display and affectation which ill assorted with the affectionate obsequiousness of her manner.

'Really,' whined the honourable guest, 'that terrible conveyance has jolted me to death, so unaccustomed am I to that style of travelling.'

'Then why did you travel so, my dear?' bluntly demanded Mr Borradaile, who was regarding his niece with a puzzled look, which she did not appear quite to relish.

'Why, you see, my dear sir,' replied the lady in soft patronising tones, 'I thought it might inconvenience you had I brought a carriage or servants. So I determined to come in a homely, quiet way, and not to disturb your routine of charming cottage-life.'

'I am sure it is very kind of you to come at all,' said Mrs Borradaile, with eager attention unshawling her guest, and frowning at her husband to be silent. But Peter Borradaile was not always to be silenced even by Nelly, so he sturdily answered his fine lady niece in his own honest fashion.

'As to your inconveniencing us, that is out of the question, my dear, for there is carriage room and stabling for more than you would have brought had you studied your own comfort ever so much. But you'll know better another time. And now, tell me who you are considered to resemble, for your poor mother, my sister Bess, had blue eyes, and—and—I'm afraid you will think your old uncle the tradesman a vulgar fellow, and fit only for going back to his shop, when he says that you are a *little* bit older looking than he expected to see you!'

The Honourable Mrs Ivor appeared much shocked by this rude speech, and her face was suffused with scarlet, as she answered quickly: 'The life I have led, uncle, accounts for it: one of the fashionable world must not be judged beside fresh blooming rustic damsels.' Here she looked admiringly at Mrs Borradaile and Lucy, adding: 'Your natural rouge would be coveted by my beautiful though pallid friend the Duchess of C—.'

This was the climax: here was the friend of the Duchess of C— being bored by Peter Borradaile, and perhaps disgusted at the first onset!

'You do make such odd speeches, Mr Borradaile,' said Nelly deprecatingly. 'Pray excuse him, madam'—this to Mrs Ivor—'he often says quite as homely things to me.'

'Do call me Julia,' minced the reclining lady. 'My beloved friend, Lady Annabel, always does; and you know, besides, I am your niece.' And from that time forward the most amicable footing of intimacy existed between the two ladies, increasing daily as they knew more of each other. Mrs Borradaile was 'aunt,' and the Honourable Mrs Ivor was 'Julia,' but Julia did not take to Lucy, and she whispered in confidence to 'dear aunt,' that Cousin Lucy was 'decidedly plebeian.' Now Julia's little prying black eyes never seemed to like meeting the open truthful gaze of sweet Lucy Borradaile: Lucy was so quiet, unobtrusive, and at the same time so self-possessed, that it was impossible for affectation or impertinence to make way with her. And the impertinence and affectation of the Honourable Mrs Ivor became more conspicuous each day and hour she passed at Otterton; and ere she had been their guest a week, hysterical affections much disturbed the equanimity of Mr Borradaile, particularly as Julia began to hint about an 'anxious and harrowed mind.'

'Poor, dear love!' whimpered Mrs Borradaile to her good man, 'she has been so extravagant; but she has such elegant taste and fine discrimination that we must look over such unimportant matters. We must

help her out of her difficulties, Mr B., by careful counsel and the loan of a fifty pounds or so.'

'Fifty pounds!' cried Mr Borradaile; 'I wish fifty may do: she has asked me for a deal more than that already.'

'No! Has she though?' replied Nelly with an expressive simper. 'Poor, dear love! she tells me her villa is the most unique thing in the world, and I am to stay there at Christmas, and the Duchess of C—, and Lady Annabel too. She means of course to include you, Mr B., and Lucy in the invitation; but we must do our best to cheer her up ere she leaves us.'

And the best was done to cheer up the troublesome fine lady ere she departed on her travels, which in three weeks from the date of her arrival she deplored it was her 'hard destiny to do.' This announcement, however, seemed to have been hastened by the arrival of Charles Worthington, who found still less favour in the eyes of Mrs Ivor than in those of Nelly herself. After his appearance the honourable dame became more and more restless; till after being closeted for some time with Mr Borradaile, she informed the circle generally of her determination to quit 'beautiful Otterton' the next day. Charles and Lucy exchanged smiling glances as Mrs Ivor bewailed 'her doom,' she 'so adored the country,' and 'was so supremely happy with them.'

'Well, my dear, then you must come again,' said Mr Borradaile in the simplicity and kindness of his honest heart; 'and don't pay us such a short visit—you know that Devon is a fine place to economise in.' This was said in a significant voice, meant to be very expressive.

'Ah, my dear, excellent uncle!' said the lady; 'you are all coming to me at Ivor Lodge to pass Christmas; my dearest cronies, the Duchess of C— and Lady Annabel, are to be of our party. You, too, Mr Charles, I shall be happy to see with your relatives.'

Charles bowed gravely, and thanked the honourable dame for her invitation.

Mr Borradaile was evidently relieved when his niece departed; and although Charles and Lucy uttered not a word against the absent, yet they too obviously threw off an irksome restraint which it had been impossible to divest themselves of in the presence of their late guest. Mrs Borradaile also was supremely happy; the Honourable Julia was her 'beloved niece,' Julia had presented her, too, with a gay brooch, and the anticipation of the coming Christmas was an Elysian dream!

But when the festive season approached, and no tidings were heard of Mrs Ivor, despite her promises to her 'dear aunt' of corresponding regularly—then did Mrs Borradaile wax wroth, and become fidgety exceedingly, to the manifest discomfort of her worthy husband.

'Why don't you write to Julia yourself, Mrs B.?' said he: 'that would be the shortest way of settling things; and tell her you don't forget her invitation to eat roast beef and plum-pudding.'

'Upon my word, Mr B.,' responded his spouse, brightening up, 'that is not a bad idea of yours—though I shan't be so vulgar as to name roast beef and plum-pudding!'

Mr Borradaile, who was endeavouring to get through the newspaper, here made a sudden exclamation as his eye caught a paragraph which he pointed out to his wife, saying at the same time: 'This accounts for my niece's silence, and I think you had better write to her at once, Nelly. She didn't mention, when she quitted us, that it was her intention to sojourn in Paris—that sink of extravagance—or I don't think I should.' But here Mr Borradaile checked himself, and again applied vigorously to the paper.

The paragraph alluded to was merely a statement, under the head of fashionable intelligence, of the Honourable Mrs Ivor's return, after a prolonged sojourn in the French capital, and her intention of enter-

taining a distinguished party of friends at Ivor Lodge during the ensuing Christmas.

'Dear Julia! no wonder she forgot to write in dear delightful Paris. I can perfectly excuse her!' And Nelly forthwith sat down and penned a neat and affectionate billet to her 'dear niece,' reminding her of the nearness of the happy time when they were to have the felicity of paying her a visit, and in a postscript, delicately alluding to a little matter of business between the two ladies.

What was Mrs Borradaile's rage and mortification, Mr Borradaile's surprise, and Lucy's sympathising concern, on a few carelessly scrawled lines from 'Julia Ivor' being received through the post, enclosing poor Nelly's note, and politely regretting that she had opened a missive evidently designed for some one else, but which she now hastened to return.

'This is not my cousin Julia's writings,' said Lucy, examining the letter; 'she wrote a curious, round, cramped hand, as if slowly and with some difficulty; but this is dashed off in true patrician style.'

'Nevertheless, Lucy, it is from Mrs Ivor, sealed with her seal, and dated Ivor Lodge—there is no mistake! The impudent minx!—what can she mean? Does she mean to cut us?' \

'Cut us? nonsense, Mrs B.,' exclaimed her husband. 'There is some queer mistake, depend upon it. Why, how can you suppose she would cut us, as you term it, when she is in my debt a good five hundred pounds, which she wheedled me out of, to help, she said, to free her from some pressing difficulties?'

'Five hundred pounds from you, Mr B.!' cried Nelly in dismay: 'impossible, she never dared do such a thing.'

'Dare or not, Mrs B., she got it, and I wish I may get it,' replied Mr Borradaile sighing.

'Oh the cunning jade!' screamed Mrs Borradaile; 'she's got my five hundred too! I drew it out of the bank for her, and she faithfully promised to pay me before Christmas, and gave me this brooch as a pledge. I'll keep her secret no longer—her debt of honour indeed, to the Duchess of C—, which my fortune went to pay! Mistake or no mistake, I'll have my money back, if I set off for Ivor Lodge, and face Madam Ivor myself!'

'Be pacified, Mrs B.,' said her spouse gravely, for he was considerably staggered by what his wife had unfolded; 'you should not have given so large a sum, even to my niece, without consulting me, and it was wrong of her to play upon your weakness, and borrow it. But no doubt all will be right, and we must clear up this strange mistake. You remember Julia asking Charles to visit her at Christmas; I shall write to him at once, mentioning what has happened, and request him to call at Richmond, see Julia, and clear it up.'

'What a capital plan, papa!' cried Lucy: 'there is nothing like going to work in a straightforward, plain way.'

'I wish every lady thought so, my darling,' replied her father. 'Your mother and I would be richer by a thousand pounds just now.'

'La! Mr B., do you think the money isn't safe?' cried Nelly. 'She is your niece, you know; not mine, thank goodness!'

Mr Borradaile was a wise man, and he never recriminated; so he only gave a sly smile, which, however, said a great deal, but held his peace.

Charles Worthington, after a slight delay, answered his uncle's letter in person. 'Well, Charles,' was the eager greeting, 'have you been to Richmond?'

'Yes,' was the quiet reply.

'And have you seen Julia Ivor?'

'Yes,' in the same tone.

'Well; and what does she say for herself?'

'She says that she is very sorry for you.'

'Sorry!—what the deuce is she sorry about? Is she a bankrupt, Charles?'

'No, sir,' said Charles smiling; 'far from that, I should think.'

'Then what is she sorry about—and what is all this? Do explain at once, and in few words, for I see plainly there is something wrong.'

'There is, indeed, my dear uncle; and you have been most shamefully robbed.'

'Robbed!' exclaimed Mr and Mrs Borradaile in chorus—'robbed!'

'Yes, I fear so. To make a painful matter short, let me tell you that your niece, Mrs Ivor, is quite incapable of such proceedings as the false Mrs Ivor was so successful in. The fine lady whom you entertained here was no less a personage than Penelope Smith, the handmaiden of the real honourable lady, who is a charming personage despite her foibles; for she severely blames herself for the careless habits which afforded such opportunities for the clever but evil-disposed Pen to carry out her knavish projects.' Charles then went on to say, that Mrs Ivor frequently desired Penelope Smith to open her letters, and burn those which were of no interest or consequence; in short, Pen was her idle lady's right hand. But Pen was found out in an intimacy with a notorious swindler, and Mrs Ivor threatened to discharge her if she did not immediately give up so disreputable a suitor. After some demur, Pen promised to do so; but this was merely a subterfuge; for to her mistress's surprise she suddenly notified her intention of quitting Mrs Ivor's service; just as the latter was on the eve of setting off for the continent. Mrs Ivor was very angry and annoyed, but she comforted herself with the reflection that in Paris she could easily procure an abigail less faithless and quite as expert as Miss Pen. So Penelope Smith was instantly dismissed, and Mrs Ivor had since heard that she had gone off to America with the vagabond, at whose instigation, doubtless, she had played off her impudent trick on the Borradailes, suggested to her fertile imagination on reading Mr Borradaile's epistle to his unknown niece, and also from perhaps having heard rumours of Mrs Ivor's maternal descent, thus corroborating Mr Borradaile's expressions of their being strangers, yet such near kin.

'The name of Borradaile is one,' said Mrs Ivor to Charles, 'which has haunted me in dreams as a dim memory of childhood.'

'Yet you were not aware that it was your deceased mother's maiden name,' replied Charles.

The lady's face darkened as she spoke with a sigh: 'I have always feared to ask aught concerning that dear parent; for I was always forbidden, in a threatening and mysterious manner, so much as to allude to my mother or her family.'

'She was, however, the sister of a good man and an upright,' replied Charles warmly; 'and the fault of an early and thoughtless marriage is the only one you have to blush for when your mother is named.' Here Charles ceased, for Mrs Ivor was weeping and much affected; but ere he quitted her a full explanation of past circumstances ensued, when she expressed an earnest desire to know her maternal uncle and Cousin Lucy. 'Moreover,' said Charles, 'she entreats you all to keep your appointment with the "Honourable Mrs Ivor," your humble servant being included in this real and hospitable invitation.'

'And my five hundred pounds,' cried Mrs Borradaile—'am I never to see that again?'

'I fear not, madam,' replied Charles with a comically serious face.

'Well, then, I'll have nothing to do with fine ladies, real or pretended, any more. Not I, indeed! I'll be bound the mistress is as bad as the maid, and she'll be borrowing our cash by and by. No, no; I've had enough of honourables—and my own fortune gone for ever!'

'My dear Nelly,' said her husband kindly, 'I would

cheerfully have paid down five hundred pounds to cure you of that little besetting weakness—a love of fine folks. So never mind; you shall be as rich as ever; and I'll return into the bank your whole 'fortune' in your own name. As to my share of the loss I don't regret it, if it gives me such a niece as Charlie here describes. We'll keep our merry Christmas, however, at Otterton among our own people and our own poor; although I think it just possible that Julia Ivor may be induced to join us early in the spring. What say you, Charlie, my lad?

Charles laughed, and sweet Lucy blushed, and Mr Borradaile was immensely facetious; but the why or wherefore was not explained, and Nelly said it was 'very odd to jest when a thousand pounds had been made off with.'

But many serious words are spoken in jest; for with early spring came the real Mrs Ivor, to be present at the celebration of Lucy's nuptials with Charles Worthington, and looking almost as pretty as the fair bride. Ere she quitted Otterton, Julia had succeeded in reconciling Mrs Borradaile to one fashionable lady at least, and in making Uncle Borradaile promise to bring Nelly with him on a long summer visit to Ivor Lodge, not to meet the Duchess of C—and Lady Annabel, but personages of far more importance to them all—even Mr and Mrs Charles Worthington.

ATMOSPHERIC WAVES.

THE term atmospheric waves is one which of late years has not infrequently appeared in print in the reports of the British Association and other scientific publications, without, however, conveying to the minds of the majority of readers other than a vague notion of its import. The phenomena which it indicates are nevertheless of a singularly interesting character, giving us, in what is as yet known of them, an insight to some of the movements of the great aerial ocean which surrounds us.

One of the facts revealed to us by the barometer is, that the pressure of the atmosphere is undergoing continual modifications, now rising to a maximum, then descending to a minimum, at longer or shorter intervals. The maximum of pressure has been found by experience not confined to any special locality, but manifested over a wide region at one and the same time, forming, as it were, a continuous line, sometimes of great length. Extended observation has shewn that the readings of a barometer at one station are intimately related to similar readings at another, and all subordinated to some great natural law, the operation of which is not yet made out with certainty. Its manifestation is seen in the elevation and depression of the mercury: for example, at the most westerly of a series of stations the barometer may indicate a maximum of pressure; it passes over and is absorbed at the next in order; and so on *seriatim* until it has been traced at the whole number.

According to Professor Dove, the north and south aerial currents being converted into south-west in the one hemisphere and north-west in the other, by the rotation of the earth, these directions would probably be found to apply to the barometric movements. But another set of currents has been detected as acting directly at right angles to the former, and the continued crossing and interference of the one with the other may be regarded as a cause of the apparent complexity of meteorological phenomena. A distinction, too, is to be made in the character of winds: some are winds of 'translation,' others of 'oscillation,' and will bear a comparison with 'oceanic currents and tide streams.' The first are monsoons and trade-winds; the last, as Sir J. Herschel observes, 'take their rise in local and temporary causes prevailing

over great areas simultaneously, the principal no doubt depending on the prevalence of cloud or clear sky, rain or dryness over great tracts for several days or weeks in succession. But once produced, and an extensive atmospheric undulation once propagated, a wind or system of winds dependent on such undulation necessarily arises also.'

Representing the maximum pressure at different stations, as above observed, by a line, it is found to have an advancing movement, caused, there is reason to believe, by an undulation, and so similar to the movements of the waters of the ocean, that the term *atmospheric wave* has been applied as most expressive of the peculiar action and effect. With maxima for wave-crests, and minima for troughs or hollows, we may thus ascertain the extent and duration of a wave; taking care, however, not to confound the movement with that of the wind. The advancing form, it must be remembered, is associated with a molecular movement—the former indicated by the barometer, the latter due to the wind.

The inquiries hitherto made into this interesting branch of natural science, and first set on foot twenty years ago, are mainly due to the British Association. So actively were they at first taken up, that by the year 1844 there were more than seventy stations of observation, embracing Europe from north to south, with an outlier or two in Asia. A large mass of observations was speedily collected, involving so severe an amount of labour in their reduction and discussion as to cause most of the observers to shrink from the task of further research. The papers by Mr Birt, published for several consecutive years in the reports of the British Association, contain the sum of much that has been done in this and other countries; while those by M. Quetelet, secretary of the Academy of Sciences at Brussels, comprise a series of highly valuable results and suggestions.

Starting with the observations of 1835, Mr Birt shews that the hollow or trough of an atmospheric wave was vertical over Brussels at three a.m. on one of the recorded days, and over London at eleven a.m. on the same day, having been eight hours travelling westerly from one to the other, at a rate of nearly thirteen miles an hour. For want of other stations beyond the two extremities, it was not possible at that time to determine the length of the wave. Afterwards a line traced from Markree in Ireland, passing through London, Brussels, and Geneva, to Gibraltar, shewed a marked progressive relationship among them. It was observed, however, that at times the Irish curve separated itself from the general law, as though disturbed by some cross wave; at others a sudden rise or 'dislocation' appeared at Gibraltar, assignable, as was supposed, to the 'immense radiation' of the African continent. In December of the same year, so regular and systematic was the rise of the mercury along this line of stations, that, in Sir J. Herschel's words, 'to take in an effect of this nature, we must enlarge our conception of an atmospheric wave till it approaches in some degree, in the extent of its sweep and the majestic regularity of its progress, to those of the tide-waves of the ocean.'

A correspondence has also been noticed between Oxford and London, Geneva and Turin, Cadix and Gibraltar. On one of the days in September 'a perfectly well-marked and definite atmospheric wave passed over the British isles and the west of Europe, the crest of the wave having a direction nearly N.E. and S.S.W., and its progress being from W.N.W. to E.S.E. The half-breadth of the wave, which occupied twenty-six hours in its passage, covered a space extending from Oxford in a direction perpendicular to that of the west, to a point not far from Halle in Wirtemberg, which gives, by rough measurement on a map, about 340 miles, and a velocity of about 21 miles per hour.'

The general results obtained from the discussion of

the observations at that time were the having traced 'distinct barometric waves of many hundreds of miles in breadth over the whole extent of Europe—that is to say, at least over an area having Markree in Ireland, Cadix in Spain, Parma in Italy, and Kremsmünster in Austria for its angular points. Not only the breadth, but the direction of the front, and the velocity of progress of such waves, were clearly made out.'

In June of 1836 a wave presented itself which was from nine to ten hours in passing from Markree to Halifax in Nova Scotia—a fact which led to further observations on both sides the Atlantic. A comparison of the Greenwich observations for 1840-41 with those made at Toronto in the same period, shewed that a general resemblance existed between the two: at each place the mercury had risen above thirty inches in every month. So clearly was the result established, that by taking a maximum of the one it was possible to predicate the maximum of the other at an interval of a few days, the difference of time being the time required for the passage of the wave. It further appears, on strict examination of the readings obtained at Greenwich, that 'twice in each month the barometer passes a maximum above, or but very slightly depressed below thirty inches, but more usually above.'

The interval between the occurrence and recurrence of the highest and lowest readings is occasionally protracted beyond what at first sight may appear to be the regular period. Thus between the January and February minima of 1841, 36 days transpired; and 31 days 16 hours between the September and October maxima of the same year. Assuming that the maxima are crests of waves, 'sixteen waves traversed England, having a mean interval between their crests of 14 days 5 hours,' in the seven months between February and October. In all of these a certain symmetry is apparent, and by a little scrutiny the type or normal wave for different countries, or different localities in the same country, may be found. Where irregularities occur, they are chiefly due to geographical position: the more the surface of a country is broken up by hills or mountains the less of uniformity will there be in the atmospheric currents. Besides which, any one system of waves is exposed to interference from different systems, or other physical causes. It is obvious that trustworthy facts can only be eliminated by attention to these disturbing causes. A few data, types for given localities, and lines of greatest asymmetry, have already been established. In November 1842, one of the latter extended from Dublin to Birmingham, Brussels, and Munich. In 1845 its course was along the southern shores of England.

With regard to the direction of waves, this is deduced from observation of the times when the maxima pass stations widely distant from each other, the order varying as the 'axis of translation' varies. Taking Greenwich, Prague, and Munich—waves from W.N.W. pass Greenwich first, and the other two places almost simultaneously, a considerable time afterwards: these exhibit, therefore, simultaneous maxima. From S.S.W. Greenwich and Munich are simultaneous: S. by W. the order is Munich, Greenwich, Prague; and S.E. Munich, Prague, and Greenwich. The line of direction for Central Europe is from the coasts of Belgium, the Netherlands, and North Germany, to the frontiers of Austria, where it converges at the extremity of the Tyrolean Alps, from whence it is prolonged, and rises to the north of the Black Sea beyond Moscow. This distance, according to M. Quetelet, is travelled over in two days, at the rate of from six to ten leagues an hour—being more rapid in proportion as the surface of the land is free from inequalities.

The system for European Russia is comprised in Dorpat, Petersburg, and Kasan. The observations in the first two accord well together, while Kasan appears to be connected also with the system of the Ural, and

forms a meeting-point for the two sets of curves. In Russian Asia the stations as yet are few, but the waves are found to traverse the great plains of the north from Pekin to Nertchinsk with marked regularity. It is worth notice, that although no close or evident relation exists among these localities, there are yet points of resemblance; for on counting the maxima and minima of any two curves for three months, there is found nearly always the same number. Parma and Pekin, so widely separated, shew a remarkable similarity on being compared.

As though to render the analogy with tide waves of the ocean more complete, certain 'nodal points' have been ascertained, round which the atmospheric waves and the winds revolve. After long-continued observation of the barometer at Brussels, the steadiness and gradual change in the height of the mercury, that city has been found to be a node. Greenwich is also a node, as regards the wind, for there, as stated by Mr Airy, the vane 'makes five revolutions per annum in one uniform direction.' On the other hand, Edinburgh is conspicuous 'for inequalities and abrupt fluctuations'; Turin is affected by the nearness of the Alps; 'Cadiz, Gibraltar, and Tangier are subject to an anomalous rise and fall of the mercury between midnight and sunrise, which interferes with and often counteracts and overcomes the regular tendency to depression in that interval—a peculiarity which is probably owing to the proximity of the great radiating surface of the African deserts.'

The troughs of the waves represent parallel lines of least pressure; consequently in them the molecular movement is strongest, and a lateral movement is induced towards them. The wind would be comparatively feeble at the crest, and by the passage of the crest over any given place the current of the foremost trough would be replaced by that of the hindmost, and in this way is explained the calm which occurs, and the sudden reversal of wind during the passing of an atmospheric wave, and the fact that the force of the wind increases as the deeper hollow of the wave advances.

Among the phenomena under notice there is one singularly remarkable—that known as the great November wave. From some cause as yet unexplained, a marked symmetrical wave occurs in this particular month year after year. In November 1842 a wave was fifteen days in passing over London, the transit of the crest occurred on the 18th; in 1843 it was on the 14th, and almost identical in contour with that of the former year. It came earlier—October 27—in 1844; and in 1845 again on November 14th; in 1846 on the 9th, but with some deviation from what had been before observed—the curve, though of the average length, being very flat, owing to the steadiness of the mercurial column through the entire period, with one exception, at more than thirty inches. At the same time subordinate waves of interference were clearly indicated, coming from the N.W. and S.W., and meeting and crossing at Brussels—another verification of its nodal position. In this November wave Mr Birt considers that we have the type of the barometric oscillations for that period of the year. The rise and fall of the wave are so nearly alike; they occur in the two weeks nearest the middle of the month; the undulations which disturb the symmetry of outline are always five in number; at the setting in of the wave the barometer is low—under twenty-nine inches. There are one or two exceptions to the rule here specified, but not sufficient to invalidate it. Eleven years' observations shew the crest to have passed within five days of the middle of the month, while from a series continued through fifteen years, it appears that a remarkable depression of the mercury occurs on the 28th. 'When dealing with undulations of such extent, it is by no means a visionary speculation to consider the possibility of tracing them over the whole of our globe; nay, perhaps of obtaining evidence

of their performing, tide-like, two or more revolutions round its surface.'

That there are tides in the atmosphere is pretty clearly determined by the meteorological observations taken at St Helena during several years. The conclusion has been come to from the fact, that on that island the mercury is higher every day 'when the moon is on the meridian above or below the pole, than when she is six hours distant from the meridian on either side.' The effect is minute, but not, on that account, the less real.

As to the origin of atmospheric waves, it is admitted that the heated air of the equatorial regions, after its ascent and cooling, descends in the polar regions. The dispersion of this cooled air may give rise to the aerial waves; their propagation would accompany the currents from the pole to the equator, and in our hemisphere from north to south. Or the cooled air may diffuse itself immediately around the pole, and if it form, as it were, a complete canopy, the waves would be continuous under every longitude, and passing any given station, might be traced all round the globe. But contrariwise, should the diffusion of the cooled air take place at some distance from the pole, instead of forming a continuous circle, and propagating itself by extension, it will be a sector having its angle more or less open. The sectors, by penetrating or insulating each other, would produce as a result a rapid series of undulations at the points of contact.

According to M. Quetelet, the latter is the most probable explanation of the phenomena; the observations indicate rather several distinct waves than one continuous. As before observed, the question is complicated by the influence which a secondary system of waves exerts on the principal one; lessening, or at times nullifying, the maximum. Yet there seems no reason to doubt that certain undulations, continuous but irregular, do circle round the pole. In Northern Europe and Siberia a system extends from north to south, the waves of which may be regarded as sectors of different arcs not having precisely the same centres, nor yet at the same instant the same radii. From the juxtaposition of these partial waves there will result a general undulation, making the entire circuit of the pole in every latitude, advancing in certain places towards the south, in others retreating towards the north, whereby the stations in the circle would be continually recording a succession of waves.

THE PALACE AT WESTMINSTER.

HOUSE OF LORDS.

M. VIEUXTEMPS and Herr von Blunderblast were punctual to their appointment—time, two o'clock P.M.; place, by Nelson's Column, Trafalgar Square—and we forthwith proceeded down Parliament Street.

'Does the House of Lords assemble so early?' asked Herr von Blunderblast.

'Not often as a legislative body: it is now sitting in its judicial capacity only. The House of Peers is the final Court of Appeal from Chancery, and writs of error lie to it from the Courts of Queen's Bench in England and Ireland, and the Supreme Courts of Scotland.'

'A miscellaneous kind of Cour de Cassation,' remarked M. Vieuxtemps with quite a perceptible sneer. 'An assemblage of bishops, admirals, generals, parvenu merchants, must constitute an admirable tribunal for deciding in the last resort vexed and intricate questions of law or equity.'

'The House of Lords exercises higher judicial functions than your Cour de Cassation, and the certainly absurd theory of such a court of appellate jurisdiction is much modified in practice. It is true that every peer who has subscribed the parliamentary roll has an undisputed right to attend and vote upon all judicial decisions, but the judgments in point of

fact are invariably pronounced by the law lords alone who have heard the arguments: by the lord chancellor for the time being—by ex-chancellors, vice-chancellors, and judges who happen to be peers. Amongst others, at the present time, by Lords Lyndhurst, Brougham, Campbell, Denman, Cranworth.'

'This merely voluntary refraining from the exercise of a right on the part of the mass of the peerage,' said Herr von Blunderblast, 'may answer very well in fair weather, when only ordinary questions of law are in dispute, but scarcely, sir, I should think, when decisions involving political and party results are in the balance.'

'It should seem so, but the fact is otherwise. This was proved on a somewhat recent and famous occasion. The late Mr O'Connell was convicted of sedition, and fined and imprisoned by the Irish Court of Queen's Bench, Dublin. A writ of error, impugning the legality of the proceedings in that court, was brought, and the judgment was reversed by the House of Lords—that is, by the votes of three law lords, Cottenham, Denman, and Campbell, against two, those of Lyndhurst and Brougham. When the judgment was given there were many peers in the House vehemently opposed to O'Connell, and who thought the judgment of the court below ought to have been maintained. One Irish peer cried, "Non-content," when the question was put by the lord chancellor, and rose to insist upon his strict right to divide the House; but the cries of "Order, order!" which arose on all sides, compelled him to forego his intention; and judgment, the effect of which was the immediate liberation of O'Connell, was pronounced. So entirely a thing of growth, of precedence, and habit, as I have before told you, is this constitution of checks and balances under which we live.'

'A very illogical haphazard system it appears to me,' said M. Vieuxtemps.

'Quite so: it is no more symmetrical than a granite rock.'

'But pray,' persisted the systematising French gentleman—'pray how was it that the law or statute by virtue of which the peers sit as a judicial body did not prescribe in terms the practice which the good sense of the Lords alone induces them to adopt?'

'For the very excellent reason that the House does not exercise judicial functions by virtue of any special law or statute. It is a jurisdiction purely founded on precedent, custom—a remnant of the all-embracing authority exercised by the House when it was the "Magnum Concilium" of the realm, and it would not even now bear much straining. The Lords had a narrow miss of losing this appellate jurisdiction of theirs at about the same time that the Commons, in the reign of Charles the Second, deprived them of their claim to "original jurisdiction."'

'Indeed! How did that happen?'

'In this manner: One Skinner sued the East India Company before the Peers for alleged wrong and oppression, and obtained five thousand pounds' damages against the Company, the plea in bar of jurisdiction having been overruled. The corporation appealed to the Commons, who reported, "that the Lords, in taking cognisance of an original complaint, had acted illegally." The Peers, highly indignant, in their turn resolved, "that the House of Commons entertaining the scandalous petition of the East India Company against the Lords' House of Parliament was a breach of their Lordships' privileges," and following up their resolution by deeds, fined Sir Samuel Barnardiston, chairman of the Company, and member of parliament, five hundred pounds. He refused to pay, and the Lords committed him to prison.'

'Bravo!' exclaimed M. Vieuxtemps. 'That was acting with vigour and decision—ever the true secret of success.'

'Perhaps so when the opposing forces are pretty

equal in substantive power, but availing little to either of the other estates of the realm in a contest with the Commons.'

'Well, but what,' said Herr von Blunderblast, 'did your famous Commons do? Did they send a troop of cavalry to liberate their member by force?'

'Not they. But having resolved that to bring "original" suits before the Peers was illegal, they directed the sergeant-at-arms to seize Skinner, and shut him up in Newgate for "contempt" of the Honourable House; and the ultimate result was the liberation of Barnardiston without payment of the fine, and the suppression of the original jurisdiction of the Lords; it being well understood that the Commons would send any and everybody to Newgate, by warrant of Mr Speaker, who should bring, or assist in bringing, an original suit before the Peers.'

'Upon my word!' said Herr von Blunderblast, 'a very decisive mode of action, and, I doubt not, much more effectual in the long-run than horse, foot, and artillery. But you were saying the Peers, about the same time, had a narrow escape of losing the appellate authority, the exercise of which we are about to witness.'

'In 1675 their lordships, in proceedings in the appeal case of Shirley *versus* Sir John Fagg, compelled members of parliament to appear as respondents. This the Commons pronounced a breach of privilege, and the ever-ready sergeant-at-arms seized four counsel who had pleaded in the cause before the Peers, and committed them to Newgate for contempt.'

'They did!' exclaimed M. Vieuxtemps: 'but where was the king that he did not interfere to prevent so audacious an act of arbitrary power?'

'I am sure I cannot say; for aught I know—in the words of the nursery rhyme—

"The king was in his palace, counting out his money;"

but wherever his majesty might have been, neither the king, nor all the king's horses, and all the king's men," could get a prisoner for "contempt" out of the clutches of the Commons during their session. Even the writ of *habeas corpus* is powerless to do that; and were it not so, I do not well see how they could efficiently exercise many of their highest functions—the impeachment, for instance, of great officers of state, and the supervision of the law courts, the judges of which they can compel to appear at the bar of the House to answer for neglect or corruption in the performance of their duties. The Lords, however, tried a fall with the Commons, and another illustration of the necessary result following a collision between the vessel of porcelain and that of iron was afforded. They directed the gentleman usher of the black rod, their executive officer, to liberate the four counsel: he did so. The sergeant-at-arms, by order of the Commons, retook them, and for better security lodged them in the Tower. The Lords armed their gentleman usher of the black rod with a writ empowering him to release the barristers by force from their new custody: the lieutenant of the Tower applied to the House of Commons for instructions, and was ordered to retain the prisoners in defiance of any command to liberate them not issuing from themselves. The final upshot of these complicated disputes, which lasted over several years, was, as I have stated, the loss of the original jurisdiction of the Peers, and the permitted retention of the appellate functions, saving, of course, "the undoubted privileges of the Commons." But here we are in Abingdon Street once more, and at the temporary entrance of their Lordships' new House.

'Shall we be admitted without orders?'

'There is no necessity for any order when the House is sitting as a court of justice. By the way, if any of your friends should merely wish to see the interior of the House, they can do so on every Wednesday and

Saturday, by application at the Lord Chamberlain's Office just below, on this same side of the way. Any decently-attired person can have a pass-paper by merely giving his address in writing. But let us in.'

'Those eternal wigs again!' said M. Vieuxtemps *sotto voce*, as we reached the space below the bar of the gilded gorgeous chamber.

'They are arguing an appeal from a Chancery judgment to the House of Lords.'

'But where is the House of Lords?' inquired Herr von Blunderblast.

'Those three gentlemen seated on the scarlet-cushioned benches are the House of Lords on this occasion. Three peers suffice to make a House; and three being present, the House is complete.'

'A curious House!' remarked M. Vieuxtemps, after having listened to and watched the proceedings for about a quarter of an hour. 'One of the three peers sitting in judgment upon the decree of a lord chancellor is busy with a newspaper; another is reading a letter; and the third, who alone appears to listen, every now and then starts up, walks about the House with his hands in his pockets, and interrupts counsel in the strangest manner.'

'The peer reading the newspaper is a captain in the royal navy; he absorbed in the letter is a general officer; and the third is the law lord, who is hearing and will decide this appeal. The two others have been caught, and retained merely to make a House, and will have no more really to do with the decision than you or I.'

'Look!' hastily whispered Herr von Blunderblast; 'the law lord has shot out of the House by the red curtain yonder.'

'He has retired for a short time only; and as proceedings are necessarily suspended during his absence, you have leisure to look around and give me, slightly above your breath, your opinion of this dazzling chamber.'

'A splendid place certainly; but'—M. Vieuxtemps paused. 'But what an overpowering glare of gilding and lavish ornament! The stained windows are powerless to shade or soften such a mass of gilded chairs, gilded pillars, gilded galleries, gilded candelabra, gilded ceiling, red cushions, red curtains, red woollack—for that enormous square ottoman in front of the Queen's chair of state, with its enamels and crystals is, I conclude, the woollack—red, blue, and gold colour, in lavish profusion! It is certainly a very dazzling, glittering chamber; but hardly suitable, it seems to me, for a hall in which legislative business is to be transacted.'

'It is the Peers' House you will remember—the chamber in which Her Majesty meets and addresses the two Houses. The Commons' House will have little or no gilding; and, after all, it is solid oak which the glittering gold-leaf covers and conceals.'

'Surely,' said Herr von Blunderblast, 'this chamber could not contain the British peerage, between four and five hundred in number?'

'Certainly it would not seat them. The benches on each side, with red morocco cushions, will hold about two hundred and fifty; then there are the cross-benches in front of us; and the light, elegant, side-galleries. But it is very seldom indeed that half the peers are present. The custom in this House of voting by proxy, except in committee, tends of course greatly to diminish the average attendance.'

'The chair on the right of the Queen's is, I perceive by the triple plume above it, intended for the Prince of Wales. Has His Royal Highness yet occupied it?'

'Not yet; but I daresay it will not be long before he takes part in the splendid pageantry of opening or proroguing parliament.'

'That must be a magnificent scene, and a very

trying one, I should suppose, to a young female sovereign.'

'Her Majesty appears in it to great advantage, enacting her part in the gorgeous ceremonial with inimitable dignity and grace—a grace and dignity which lessons could not teach. Her reading of the speech is singularly fine, purely intoned, and clear, effortless, and musical as a silver-bell.'

'The House is, I suppose, generally full upon such occasions?'

'It has always been so during this reign. The rise of the House when the Queen enters, thronged as it is with peers and peeresses, gorgeously arrayed in stars, garters, feathers, diamonds, naval and military uniforms, bishops in lawn sleeves, foreign diplomatists covered with orders and crosses, is magnificent; and after Her Majesty is seated, her ladies and pages have arranged her splendid robe, and she commands her faithful Commons to be summoned, there is another, and especially if she be there to prorogue the parliament, a far more impressive character of power impressed upon the scene. Mr Speaker enters, followed by a mass of unruly members, jostling each other for a good place, and filling to overflow the space below the bar in which we are now standing. As soon as silence is obtained, the right honourable gentleman addresses the Queen, enumerates the chief labours of the session, and concludes by presenting the Supply and Appropriation Bills, reserved for the occasion, and prays Her Majesty's assent to them; which assent is accordingly given in the old formula used only for this particular bill:—"La Reine remercie ses bons sujets, accepte leur b n volence, et ainsi le veut"—("The Queen thanks her good subjects, accepts their gift or benevolence, and so wills it.") One feels that those ordinarily-attired men, with their supply-bill, are the many-shafted column which supports and gives height and true magnificence to the richly-capitalised, the gorgeously-domed edifice, which, with all its incongruities, stretches its ample and majestic roof over one of the noblest societies of freemen the world has ever witnessed.'

'But surely the Peers are the Upper, the Commons the Lower House?' remarked M. Vieuxtemps.

'In name, yes. The shadow has remained, though the substance has long since departed. The Lords' House, albeit, has still deep roots in the tenacious soil which it once overshadowed. Its historic names, vast wealth, unquestionable patriotism, and moderating influence upon the possibly too hasty speed of legislation, maintain, and will long maintain it as a virile and independent estate of the realm; but in substantive power the Houses have gradually, during the last five hundred years, changed places. I will give you an illustration of the silent revolution in this matter which has occurred. Forms with us, provided they be only forms, and in reality not injurious, are very, very slowly discarded. Thus it happens that when the Houses disagree with respect to changes in any measure under discussion, and mutually appoint 'managers' to meet each other and explain on both sides the reasons of disagreement, the Lords' managers, on meeting the Commons' managers, sit down with their hats on, the Commons remaining upstanding and uncovered. The Lords of course being gentlemen as well as peers, immediately the custom is vindicated, uncover, and the Commons seat themselves. Well, in a room belonging to the Peers' House where this *bizarre* ceremony had been exhibited, there were placed, or were about to be placed, last year, by desire of the Peers, three pictures by Landseer, of which the cost was a few thousand guineas. The Commons, who approach their Lordships uncovered, refused them this trifling gratification: the money was struck out of the miscellaneous estimates, and the Peers obliged to forego their pictures.'

'It did not require such an instance to convince me that your pretended monarchy is but a rampant demo-

cracy, its plebeian limbs concealed beneath ermined robes, and its truculent brow veiled by a royal diadem,' said M. Vieuxtemps.

'That, my dear sir, is a gross exaggeration, permit me to say: the aristocratic element is very powerful in this country, and the monarchical principle, as we understand and honour it, remained not only erect, but unshaken amidst the crash a year or two ago of falling thrones and dynasties.'

'The royal assent is not always given to bills in the terms you have mentioned?' said Herr von Blunderblast.

'No; there are three other forms. To an ordinary public bill the form is, "La Reine le veut" ("The Queen wills it.") To a private bill: "Soit fait comme il est d sir " ("Let it be done as desired.") To a bill embodying a petition or declaration of a *right*, as in the time of Charles the First, the form is "Soit droit fait comme il est d sir " ("Let right be done as desired.")'

'I wonder,' said M. Vieuxtemps, 'these vestiges of Norman domination should be retained: they must tend to keep alive humiliating recollections.'

'Humiliating fiddlesticks! Oliver Cromwell, to be sure, abolished them, and gave his assent to laws in plain English, but the old form came back with the Restoration; and here, by the by, is the law lord back again, and as neither of us has, I suppose, any overpowering desire to listen to further eloquence in the matter of this Chancery appeal, we had better adjourn to Bellamy's for the hour or so which will elapse before the Peers sit as legislators.'

'Bellamy's! What is Bellamy's?' asked Herr von Blunderblast.

'A highly constitutional institution connected with the House of Commons, and domiciled in the same building: in other words, a very excellent hotel, in which members take dinner, wine, punch, and refuge from long speeches, quite certain that the division-bell will summon them in time for the most important part of their duties: Bellamy's is also, I am happy to say, open to other persons, not being members, who have "money in their pouch."'

After we had dined, it was time to return to the House of Lords. I had provided myself with peers' orders, and we, consequently, the House being assembled, were soon in the Strangers' Gallery, very inconveniently situated behind that of the Reporters'.

'Ah! there is the lord chancellor we saw the other day seated on the woolsack,' said M. Vieuxtemps; 'but who is that big-wigged gentleman on the crimson ottoman in front of him?'

'That is Mr Baron Parke, come, I suppose, to read a unanimous judgment of the judges of the Common-Law Courts upon some point submitted to them by their lordships. It is so: hark!'

'Do the Peers always govern themselves by this opinion?' asked Herr von Blunderblast.

'It is very rarely they do not. One exception was O'Connell's case, before mentioned, a great majority of the judges having pronounced the proceedings of the Irish court to be perfectly legal. This Mr Baron Parke, however, dissented from that opinion. When the judges are not of one mind they attend and deliver their opinions *seriatim*.'

'That is a bishop, I suppose,' remarked M. Vieuxtemps, 'on the upper bench to the right of the chancellor; but how is it he does not wear his mitre?'

'His lordship, being the junior bishop, has attended to say prayers. As to mitres, the bishops of the English established church only wear them on their coach-panels and signet-seals. That venerable-looking peer on the same side of the House, who is presenting a petition, is the president of the Council—the most Noble the Marquis of Lansdowne. Nearly opposite to him you observe a peer of something more than fifty years of age; his eye on fire with youthful energy, and his

whole countenance alive with an expression of fearless combativeness: that is Lord Stanley, the present leader of Her Majesty's Opposition in the Peers.'

'A man of nerve,' observed M. Vieuxtemps. 'That is perceptible at a glance. But how thin the House is! and how inanimate and solemn compared with your boisterous, excited Commons!'

'There are between twenty and thirty peers present, and that is quite an average House. There is an immense difference between speaking before so sparse and unenthusiastic an audience as this and addressing the House of Commons. The reporters, however, supply their Lordships with an immense audience; and the reader of the debates little imagines that the fiery speech, interspersed with "loud cheers," "repeated cheers," was perhaps addressed to five or six elderly gentlemen only.'

'What is this interruption?' asked M. Vieuxtemps, as Sir George Grey, accompanied by several members, appeared at the bar with several bills passed by the Commons.

'It is the Home Secretary,' I answered, 'presenting, in the customary form, various bills passed by the Commons. The clerk, you perceive, takes them; their titles are announced in a loud voice; a record of their presentation is entered on the Lords' journals; and they are frequently, if public bills, read a first time at once. The Lords send their bills or messages to the Commons by two masters in Chancery.'

'Who is that peer talking privately with the lord chancellor?'

'An Irish representative peer; but I forget his name for the moment.'

'Irish representative peer—what is the meaning of that?'

'The Irish and Scottish peerages do not sit in this House individually: they choose a certain number of their order, as settled by the Acts of Union, to represent them. The Irish representative peers—twenty-eight in number—are chosen for life; the Scottish—sixteen in number—for each parliament. The Crown has power to add to the numbers of the Scotch and Irish peers in this House, but English peers Her Majesty may create *ad libitum*.'

'What, then, becomes of the independence of the House of Peers if the Queen can at any moment swamp them by new creations?' asked M. Vieuxtemps.

'The unlimited right of the Crown to create peers is one of the weapons, in the armoury of the constitution, which can never be wielded except in extreme cases, in which the ministers of the sovereign are supported by an overwhelming majority of the Commons. The only instance I remember of the creation of peers, specially for the purpose of swamping a hostile majority, was by Sir Robert Walpole, who induced the monarch to create twelve in one day for that purpose: a witty peer of that day asked them whether they intended to vote individually or by their foreman: nevertheless it is essential the power should be lodged in the Crown. The mere menace of exercising it dissipated, a few years ago, a very great danger to the state.'

'Who is that stooping, white-headed gentleman, whom everybody greets and shakes hands with? I cannot see his face.'

'If you had seen it, you would not have asked the question: that is the world-famous Duke of Wellington. He seats himself, you perceive, on one of the cross-benches, and he has, I daresay, fifty or sixty proxies in his pocket, to be used as unto him seemeth fit. He exercises a vast moral influence in this House; but since the death of Sir Robert Peel, in whose legislative wisdom he appears to have placed implicit confidence, he has meddled very little with active politics.'

'The debate is very gentlemanly,' observed Herr von Blunderblast; 'very courteous, and strangely dull.

The Peers fight with the gloves on—to borrow an illustration from one of your national sports—whilst the Commons appeared to strike with mailed hands, and draw blood at every stroke.'

'Yes; and see, decorous and gentle as it has been, it is already over: the House is about to adjourn, and we must begone.'

'Well, gentlemen, how say you—have I redeemed my pledge? Is a free constitution compatible with a great monarchy, M. Vieuxtemps?'

'Well, perhaps; *mais*—' A shrug of the shoulders completed and pointed the sentence.

'And you, Herr von Blunderblast, are you satisfied that an effective military system can coexist with the supremacy of a representative government?'

'Yes—that is, if it hath grown up during centuries, and entwined itself with the habits, traditions, manners, thoughts—with the life of the people, as it were, the humblest as well as the highest—but the thing I see can no more be made, manufactured, than a tree can.'

'It is certainly a wonderful piece of mosaic,' said M. Vieuxtemps.

'And it built, you will admit, the Crystal Palace?'

'Yes, in a certain sense; *mais*—' said M. Vieuxtemps.

'There is a great deal of truth in that,' remarked Herr von Blunderblast simultaneously with M. Vieuxtemps; '*aber*—'

'Charing Cross! Bank!' shouted the conductor of an omnibus just passing. This invitation, reinforced by a few sharp drops of rain, drew us into the 'bus, and the discussion of M. Vieuxtemps's '*mais*,' and Herr von Blunderblast's '*aber*,' was by tacit consent postponed *sine die*.

SLAVE-MARKET OF NEW ORLEANS.

THE town or city of New Orleans has several particular races in it, speaking different languages, and living in separate parts of the town. One class speak French, have French manners, French-built houses, French hotels, and French names to their streets. Another class invariably speak English, and are either from England, or originally of English families. Then we have the working black population (or slaves) of the African race. Most of them are quite black, with the flat nose, thick lip, and the woolly hair peculiar to this people. The climate agrees with them, and they invariably look fine, healthy, happy, strong creatures. They are all born in America, but of real African blood. Many are sold here every day—sometimes hundreds change hands in a few hours. To a Briton the sight is of course repulsive. But such is the state of things here, that you must keep perfectly quiet, and make no remarks, or else you are sure to get into trouble; for most persons, male and female, consider that they have a perfect right to act according to the laws of these western states, and buy and sell men, women, and children as they think proper.

When a young man is called up on the auction-platform, he looks about him, and does not appear to care much. Perhaps he may not have been very well pleased with his late master, and thinks he may get a better.

'Come along, my fine young fellow!' says Mr Beard, a short, thick man, with a red face—the best auctioneer here. 'That's it! Why, my friends, you can see at once that he is as powerful as an elephant, and as active and quick as an Arabian. What's your name, my fine fellow?'

'Samson, sir.' (They never have any surname.)

'Now, gentlemen, how much shall I say for this fine-grown, healthy, powerful young man, Samson? Excellent name for him—descriptive of his qualities. Now, gentlemen, give me a bid—a bid—a bid!' '500 dollars.' 'Thank you—500 dollars only is bid for one of the finest men I ever sold. Youth, health, power, and

character, all in his favour. I assure you, gentlemen, that he is worth 1200 dollars at this present moment. Look at his build, limbs, chest, carriage! 600 dollars now bid—600—600—600! Double it, my friends; come—come! '650.' 'Thank you; 650—650!' '750.' 'Now, that is more creditable,' '800.' '800 bid; 900—900; now, my friends! Gentlemen, you will never have such a chance again—only 900! 900 once—900 twice—900—900—900!' '950' '960.' '960—960—960!' '1000.' 'Now, gentlemen, 1000 only is bid for this valuable, splendid young man, free from all blemish, disease, or vice, as prescribed by law. Now, gentlemen, are you all done? Surely not letting him go at this price! However, I cannot wait. Are you all done, gentlemen? 1000 once—1000 twice—1000 thrice! Mr Jefferson, he's yours! Samson, there's your master!' and poor Samson is led away to misery or comfort, to ill usage or to kind treatment, just as it may happen. No help for him whichever it may be.

This sum was £200, a dollar being generally calculated here at four shillings. Then we had some girls and young women sold in the same way.

'Come up, Lucy! Now, gentlemen, here we have a fine specimen of everything desirable in a good servant—young, healthy, active, and industrious; can cook, wash, iron, wait at table. In fact, she is highly recommended to our attention, and is guaranteed free from all blemish, disease, or vice, as prescribed by law.' Poor Lucy was knocked down at 600 dollars—£120. These were both high prices. The men under thirty years generally sell for about £140 to £160, and the women under thirty, from £80 to £90. When above forty they are not worth more than half that price.

Such persons as the above do not care much about being sold. They are generally purchased, or at least many of them, by persons who hire them out as servants to families; and many of them have good places, and may get hired out to go to the same street, or near to where they were before. But a very different feeling is manifested at a sale of slaves belonging to a plantation. Their old master, always kind to them, may have died, or failed; and to see fifty or sixty of the slaves brought to auction is a horrible scene. All of them, old and young, may have been born on the same estate, and become endeared to one another. They think of the happy plantations, the snug little wooden whitewashed cottages surrounding their master's dwelling and garden, the summer-evening meetings, when they played the banjo, sung their native songs, and danced their cheering reels with light feet and lighter hearts; for a negro with a good master is extremely happy: being clothed, fed, comfortably housed, and well cared for. But now they are all about to be sold, and torn from each other. They are standing in rows in the auction-mart, ready for any rude hand to examine them, feel their muscle, criticise their shape, their height, their strength, or healthy appearance, and, opening their mouths with finger and thumb, inspect their teeth. A middle-aged man and woman may be seen standing together: moist are their eyes, anxiously they gaze around them—they are the picture of helplessness. They know the awful doom of separation that may be pronounced in ten minutes between them and the handsome family that cluster around them; but that doom they cannot alter or control. The sons and daughters, old enough to know what awaits them, press close together, with full eyes and still fuller hearts; while the young favourites are rejoicing, in perfect innocence, in the clothes which they are decked out in for the day, to enhance their appearance and their value; and they gaze with pleasurable amusement at the novelties of the scene, like a child at the pageantry of a funeral—the trappings of the horses, and the plumes on the hearse that bears to the grave the remains of a parent. They are at length called up; and although husband and wife go together, the

children are all taken from them, and sold into different districts; and as the mother tries to look at their retreating figures through eyes blinded with tears, she knows that in a few years they are probably fated in their turn to endure the same agony—

'And thou, my son, yet have a son foredoomed a slave to be,
Whose mother, too, must weep o'er him the tears I weep
o'er thee!'

FAREWELL!

DARK spots there are in sunny places,
Thorns on the stems of flow'rets fair,
Clouds overshadowing beauteous faces,
Young bosoms harbouring fear and care;
Mingling with tones of mirth and gladness,
We hear the dull funeral knell,
'Mid pleasure's glee the voice of sadness
Sighs mournfully, 'Farewell! farewell!
'Farewell to summer's gentle breezes,
To friendship's whispers, gentler still;
Our frames the breath of winter freezes,
Our souls are numbed by scorn and ill.
Farewell, once gay and fragrant flowers;
No dewdrop gilds the drooping bell;
So dried by grief, these hearts of ours
Can scarcely moan, Farewell, farewell!
Welcome to him the smiling morrow
Who tosses through the weary night;
Welcome to every child of sorrow
The joyful sound—'Behold the light!'
Then how can hearts by anguish riven,
Too sharp, too deep for song to tell,
Forebear to pant, to pine for Heaven,
Where none shall cry, 'Farewell, farewell!'

S. C.

SLOW AND RAPID COMPOSITION.

Speed in composition is a questionable advantage. Poetic history records two names which may represent the rapid and the thoughtful pen—Lope de Vega and Milton. We see one pouring out verses more rapidly than a secretary could write them; the other building up, in the watches of the dark, a few majestic lines. One leaving his treasures to be easily compressed into a single volume; the other to be spread abundantly over forty-six quartos. One gaining fifteen pounds; the other a hundred thousand ducats. One sitting at the door of his house, when the sun shone, in a coarse coat of gray cloth, and visited only by a few learned men from foreign countries; the other followed by crowds whenever he appeared, while even the children shouted after him with delight. It is only since the earth has fallen on both that the fame and the honours of the Spaniard and the Englishman have been changed. He who nearly finished a comedy before breakfast, now lies motionless in his small niche of monumental biography; and he who, long choosing, began late, is walking up and down, in his singing robes and with laurel round his head, in the cities of many lands; having his home and his welcome in every devout heart, and upon every learned tongue of the Christian world.—*Willmott's Pleasures of Literature.*

NAMES OF FLOWERS.

The flower *Dahlia* was so named from a Swedish botanist called Andrew Dahl, and should therefore never be pronounced as if it were spelt *Dailia*. *Camellia* should have both *ll's* pronounced; it was named after Jo. Kamel, a Jesuit, whose name is latinised *Camellus*. *Arbutus* should be accented on the first syllable: see Virgil's *Eclologies*.

PRICE 1½d.

THE LADIES' GUILD.

WHEN society began to emerge out of the darkness of the Iron Age, the gentler sex enjoyed its fair share of the elevation. Women, indeed, received from chivalry even an undue predominance, and the strength and valour of men crouched, as if with the fabulous instinct of the lion, at the feet of beauty. The women of that time, however, are not correctly appreciated in ours. It is the custom to regard them as mere painted puppets, set up by the fantastic spirit of the age as a mark for skill or bravery, and with no more authentic claims to our respect than the silken banner of the joust, where they 'rained influence and adjudged the prize.' It is not generally known, or is always forgotten, that that very banner was worked by female fingers, and that many of the luxurious trappings of chivalry, which contributed more to the advancement of society than the gallant but foolish blood that bespattered them, owed their existence to female industry and ingenuity. Even so early as the eleventh century, the women of England were so famous for embroidery that in that age it was called 'English work'; just as in ancient times it was 'Phrygian work'; and among others we read of Matildis, an English-woman, distinguished for her skill in dyeing purple, and adorning robes with gold, gems, paintings, and flowers.

In the following century this reputation continued, and the names of the fair workwomen which have come down to us belong always to the aristocratical class. Christina, Princess of Margate, who lived in the year 1189, was a capital hand at such matters; and a mitre and pair of sandals which she embroidered were declared to be perfect 'wonders.' They were presented by the abbot of St Albans to the pope of that day; and thus the loftiest head and holiest too in Europe were clothed by English female industry.

In the fourteenth century, however, we arrive at a more interesting epoch, when women stand prominently out among the ingatherers of that true harvest of the Crusades, which consisted in the establishment of industry upon the ruins of feudalism. The knights had been beggared by their extravagance; property had changed hands; and skilled artificers of all kinds felt themselves to be men—that is, when they were not women. But a great proportion of them were women; and as such they inherited, in a modified manner, the immunities bestowed by chivalry upon their grandmothers, and were allowed privileges forbidden to the men. Male artificers were tied down to one profession; but the same law secured the liberty of women—a liberty which they seem to derive from the

charter of nature itself—to do as they thought fit. A man was fixed for life to his loom, or his anvil, or his last; but a woman might try the whole circle of the trades till she found one to her taste, and then go round again out of sheer feminine love of variety. In the records of those gallant days we find female brewers, bakers, weavers, spinners, embroiderers, and others employed in various works in wool, linen, and silk. They were distinguished by the female termination *ster*: thus a brewster, backster, webster, means a woman who brews, bakes, weaves.

In the middle of the fifteenth century the female manufacturers in weaving, carding, spinning, and other branches of industry, are particularised in a public document. This is a resolution of parliament, in which the prohibition of English cloths in the Netherlands is complained of as being hurtful to our industrious countrywomen. But sometimes parliament—so unlike the parliament of our own enlightened time!—required to be reminded of its duty; and in the year 1457 we find the silkwomen of London memorialising the legislature, in good-set terms, on the injury they sustained from the free importation of foreign goods of the kind by which they themselves got their living. We may fancy the meeting at which this memorial was got up—the resolutions, the speeches, the indignant appeals, the shrill screams of laughter, defiance, or applause! But the agitation was successful; and the parliament which had complained so pathetically of a similar step taken by the Low Countries, indulged the ladies with a prohibition in their turn. The same favour was shewn to them in the year 1468; but the time was now at hand when women should stand no more upon their industrial rights, real or supposed, but come before the country, when they came at all, in the character of victims, mendicants, and castaways.

It would be impossible to describe the process by which they were elbowed out of their employments by the other sex, because this was so gradual as to be hardly perceptible except in its results. But one curious circumstance attended it; namely, that when men installed themselves in the places of women, they retained the feminine appellations, and became brewsters, backsters, websters, and so on. One only of the names remained peculiar to the fair sex—spinsters; and the law to this day appears to suppose the word to designate an employment followed by all unmarried women.

The chivalry which in one age made women objects of worship, and in another age removed the interdictions from their industry which shackled that of the men, has changed its form in ours, but not its character. We take them now entirely upon our own hands.

We consider work—except among the lower classes—a kind of degradation; and no matter how many of them may fall to our lot as individuals, we feel bound in honour to bring them up in idleness. This is very generous no doubt, but it is the ignorant, unreflecting generosity of a *preux chevalier*. It fancies that there is no change, no death in the world; it stakes the very subsistence of the objects of our solicitude upon a single hazard; it throws them for life upon sympathy, forbearance, kindness; and it accustoms them so much both to the idea and the reality of dependence, that in frequent cases many years of the higher spirits of the sex pass away in a hopeless but bitter and indignant struggle with what they conceive to be their social destiny. As for spirits of the commoner kind, their time and thoughts are occupied with the change from one dependence to another, which is the only consummation offered to their hopes. Marriage with them is the grand alternative; but marriage too seldom accompanied by that which truly consecrates it—the spontaneous love of the proud and free.

The exemption of women from the law of work is in certain classes in England one of the greatest of our social evils; and it is the more puzzling that it seems to have grown out of the advancing civilisation of the time. In our own immediate day, however, a kind of reaction seems to be at its commencement. We hear of some female authors by profession, some female artists, engravers, decorators of various kinds; there are likewise actresses and singers, who by their private characters give respectability as well as beauty to their branch of art; and there are constantly advertisements appearing—many of them fraudulent no doubt, but still indications of the turn the public mind is taking—offering professions to gentlewomen by which they may be able to support themselves in independence. All this, however, bespeaks as yet only the necessity of the case, and the craving for relief it elicits; for in reality no perceptible change has taken place in society. What is wanted is a more open agitation of the question of female employment, and an example offered in the respectable middle classes, of a nature fit to dispel for ever the prejudices which render the position of woman in society so sad and so anomalous.

For this reason we have been as much interested by the prospectus of an association called the Ladies' Guild as we were a short time since by that of the Literary Guild. The prospectus complains that hitherto almost the only resource of educated women has been tuition, and proposes a 'novel and interesting plan,' by which combination may accomplish 'what individual effort could never achieve.' This plan is for ladies to assemble in a school of instruction in London, where, for the nominal sum of two shillings per week (to meet necessary expenses) they may become mistresses of a certain decorative art, protected by patent, and their productions in which will be sold for their own benefit. Ladies in the provinces are likewise invited to this common centre, where they may form an associated home in connection with the Guild, and thus 'live at a far less cost than any individual can do in a separate position.*' There is something extremely seductive in this idea; and if Miss Wallace, the amiable and gifted patentee, who consecrates the fruits of her genius to the disenthralment of her countrywomen, were but as correct in her political economy as she is in her philanthropy, it might even be regarded as the solution of a great problem. But unluckily the production referred to, however beautiful and elegant, is a thing of mere taste and fashion; and even were it otherwise, there is no such thing as forcing an article into general consumption. In its unlimited invitation to lady-workers, the Guild,

to use a homely phrase, puts the cart before the horse: it produces supply before demand has arisen. It is not too late, however, to remedy this inadvertence. Let the number of ladies be strictly limited at first, and a fair trial given to the manufacture; and when the demand increases, so far from there being any difficulty in meeting it, the supply will seem to come of nature and necessity.

Although the Ladies' Guild, however, cannot be considered to meet the exigencies of the time, it goes a certain way towards it: it is that most important of all stages—the first step. It countenances female industry, and it offers a field for it which may prove—and we hope will prove—of considerable magnitude. The substance Miss Wallace works in is luckily of a kind to disarm many feminine prejudices; for the *gentility* of the work is unquestionable. Even in the fourteenth century, when the first manufactory was established in France by permission of Philip de Valois, it was considered that persons of the best families might follow the employment without losing caste. This idea was confirmed by the government itself, for in public deeds such manufacturers were styled 'gentlemen of the art and science of glass-making;' and the privilege of forming one of these establishments was bestowed upon a person near Lyons as a reward for military services rendered at the battle of Agincourt. We must not, however, be betrayed by these circumstances into forming any extravagant notion of the article then produced. It was nothing more than window-glass that was achieved by these 'gentlemen,' and that only in round plates, with a *boudine* or eye in the middle, affording at the utmost a square of eight inches. The colour of this glass was yellowish, variegated here and there with bubbles; and it is supposed that the desire to hide such deformities originated the custom of painting the small squares framed in lead, which formed the church windows.

The Ladies' Guild, however, have now very different materials to work upon; and we may form some idea of the results produced under Miss Wallace's patent from the following description taken from our contemporary, 'The Builder':—

'All our ideas of Oriental splendour—all the gorgeous imaginings of Orientals themselves, might now be realised to sight at least in the sober actualities of British decorative art in glass. The lustre of silver and gold, the fiery sparkle of the ruby, amethyst, and every actual or imaginable gem, and the more subdued, but no less beautiful hues of the pearl and the tropical shell, may now, by the recent efforts of British skill and invention, be combined at a moderate cost, and without a vestige of mere gaudy glitter, in the decorations of the mansions of the gentlemen of England. Miss Wallace's productions consist, in principle, of imitations of gold and silver in glass, without the use of either metal; of the protection of actual gilding or silvering under an almost invisible yet magnifying coat of glass; of a peculiar mode of adding metallic and pearly brilliancy to colours, to painted and stained figures, and to engravings, all in glass; of imitations of marbles, alabaster, malachite, &c., in glass-covered compositions; of imitations of precious stones; and of other inventions.

'Among the various forms under which these are brought into use, in architectural decoration, are those of ceilings, in which a combination of them with a peculiar mode of enamelling in white or pale blue on the inner surface of the interspaces in glass (another of this lady's numerous inventions also applied with good effect to framed engravings) is capable of producing a dazzling effect, particularly by night, with a good or even an indifferent light reflected from it. Mouldings and cornices are made to harmonise with these effects; and the same combinations, varied with the pearly brilliancy of painted flower-wreaths, and wreaths

* The school is at No. 4 Russell Place, Fitzroy Square, where applications are to be made, addressed to Mrs Hill, Vice-President of the Ladies' Guild.

of silver engraved on a gold surface, all in glass, are made to adorn the walls in form of picture-frames. Besides a number of these productions in varied detail, we saw a specimen of stained-glass decoration for windows in form of armorial bearings, in vivid colours, made peculiarly sparkling and brilliant, and in some phases pearly, by one of the processes already alluded to. One great feature in most of the inventions is, that they are all protected, mostly within hollow mouldings of glass hermetically sealed, so that the gilding, &c. can never tarnish, and the whole is in this respect everlasting. So is it with the marble imitations, which are so firmly embedded in composition that they are said to be quite well adapted to all the risk of exterior construction for which they are designed, as well as for chimney-pieces and other forms of interior decoration.*

This new and brilliant art, it will be seen, displaces no other. Its productions are *additions* to the list of elegances demanded by a refined and luxurious age, and their application is so various—so almost universal—that the institutors of the Ladies' Guild are not unjustifiable in imagining that they have opened out to women of the middle classes a wide and elegant profession. Let them take care, however, say we, of their first step. No trade can be forced; and it will be much safer and kinder to invite ladies into the field as they are wanted, than to collect a multitude in the metropolis to work on the speculation of a market.*

A TALE OF DAYS NOT LONG GONE BY.

THERE resided some years ago in London a young surgeon named Gerald Spencer. He was the younger son of a gentleman of good family but small fortune; and as everything that remained to the father was entailed on the eldest son, a good professional education was all that Gerald could expect from his father, and it was all he got. But in the matter of education nothing was spared; and as Gerald had both the will and the ability to profit by the instructions he received, there was great reason to hope for a successful professional career. It is often a good thing for a young man to have nobody to rely on but himself. Those who have something to fall back upon hope to *do* and *may do*; but he *must do or die*; and this stern alternative quickens a man's wits, and lends amazing vigour to his energies. Gerald felt the full force of the necessity; and all the more, that he was deeply in love with the daughter of one of his father's neighbours. He had known Lucy Manwaring from her childhood, for she was six years his junior, and he had loved her ever since he was old enough to know what love was. But though she was the daughter of a gentleman, like himself she had nothing but her personal qualifications to recommend her. These, however, were considerable, for she was both amiable, pretty, and intelligent, and, above all, devotedly attached to her lover, respecting whose talents she was quite enthusiastic.

* Some years ago, a paragraph suggesting wood-engraving as an employment for females was transferred into this Journal from the *'Westminster Review.'* Carried thus into the hands of the great multitude of the middle classes, who form our weekly audience, it seemed immediately to excite the hopes of a vast number of women who felt the disadvantage of the forced idleness to which they are restrained by society. The host of letters we received on the subject, chiefly inquiring by what means the fair writers could be introduced to such an employment, gave us an impression which will not soon be effaced, of the extent of the social evil in question. We wish to speak moderately when we say, that no article ever appeared in this Journal which excited one-fourth so much sensation as appeared to arise from this small quoted paragraph. Literally, years passed before the correspondence produced by it was at an end. We fear that it led in only a few instances to any useful result.—Ed.

'You may not think Gerald a sufficiently good match for me now, papa,' she would say; 'but I know the day will come that you will be proud to call Gerald your son-in-law!'

'That may be: I do not dispute Mr Spencer's talents; but in the meantime he has no money; and however clever a young man may be, it is often years before he gets into practice.'

'Very well, papa; we are in no hurry. I don't think it will be so long as you expect before Gerald makes his way. Such talents as his cannot long remain unknown; but as I said just now, we are in no hurry; and he would be quite as averse to our marriage taking place prematurely as you would be. He said only the last time he was here, that till he had a comfortable home to offer me, he would never mention the subject to you.'

'Very well, Lucy, so much the better; only don't let him mention it to you either; and take care you have not to wait for him till all the bloom is off your cheeks.'

'I'm not afraid, papa,' answered Lucy; 'but even if it were so, Gerald would love me just the same, and we could be very happy without the bloom.'

Secure of his love and sanguine of success, Gerald thought he could wait too: bright anticipations of the future lent a charm to labour that was to be so sweetly rewarded; and after studying at Paris and Vienna, and rendering himself in all respects worthy of the public patronage he counted on, with the assistance of his father he took a small house in the neighbourhood of Golden Square, and with a brass-plate on the door announcing his name and profession, he sat down to wait for patients; and patients came, not a few, betwixt nine and eleven o'clock, when it was understood he was at home; but alas, how seldom did one of them bring a guinea in his hand! They were all paupers or next to it—people whom he had attended in the hospitals, or such as were sent by these; for, enthusiastic in his art, he had willingly and carefully investigated and ministered to the maladies of the poor, and when they learned where he was to be found, they crowded to his door. And he was content to see them—they offered subjects for study and improvement; but there would be no getting on without a few rich ones too: how else was he to pay his rent, and have a home for Lucy? However, there was nothing to do but to wait and hope, and he did both—wearing though such waiting is to a man eager to rise, and who knows he has the capacity to do so, if he could once get his foot on the ladder.

The disappointments and anxieties that have attended the early career of many a man who has afterwards risen to eminence, have been so frequently described that they need not be dwelt upon here: it is enough to say that poor Gerald Spencer endured them all; and as he had spoken with confidence of his certain success both to his own friends and his mistress, it was doubly mortifying to find his performance falling so far short of his promise, that the first year he was obliged to apply to his father for money to pay his rent—a favour that was not granted without some vexatious allusions to the large sums that had been spent on an education which it was high time should produce its harvest. But still the rich drove past his door, flying for relief to men whose established reputations inspired hope and confidence, whilst he was exercising all his skill on patients who had nothing but blessings to give him in return. But although blessings are indeed blessed things, they will not furnish a man's table nor pay his rent, still less can he marry upon them; and the young surgeon's heart grew sick with disappointment as his hopes faded from day to day.

'Yes,' he would say to himself with bitterness, 'when the present generation have died off; when Astley Cooper, and Cline, and all the rest of them, are gone; when I am fifty years old, and Lucy Manwaring is

married to somebody else—for how can I expect her to wait for me all her life?—and is perhaps the mother of a dozen children, I shall get into practice and drive my carriage. I had better have been born a day-labourer than be the son of a gentleman with an empty purse, and talents I can find no opportunity of exercising.

His position was so difficult too, for his pride forbade him to tell the whole truth; and whilst he was holding out fallacious hopes to his mistress, he found them as far as ever from realisation.

Amongst the young students of medicine he had become acquainted with about the hospitals was one called O'Grady. He was an Irishman, as his name indicated; apparently of low birth, without connections, and with little talent or industry. Neither did he evince any ambition or desire to rise. He seemed either conscious that he was born for mediocrity or content with a little; but that little he never appeared to want. Yet those who had known him longest had understood from himself that he had no private resources, but had come to London to trade on his talents and education, like many amongst them. It occurred to Gerald sometimes to wonder how he contrived to live; whether he might not have fallen into some inferior line of practice that paid in some degree—a practice that, in perspective, he would himself have scorned, but now he would be too glad to take anything he could get. With the view of finding out O'Grady's secret he cultivated his society, which, from not liking him, he had originally rather avoided. When the Irishman saw him disposed to be civil, he shewed himself ready enough to meet him half way; and one day, as they quitted one of the hospitals together, he invited him to dine with him at an eating-house he frequented in the neighbourhood.

The dinner was not in the grand style, but it was plentiful; and O'Grady called for a bottle of wine to relish it—a luxury the other was little accustomed to.

'Upon my word, O'Grady,' said he, 'you make it out capitally if this is the style you live in every day. I don't know how it is, but though I get plenty of patients I never get a fee.'

'Nor I either,' said O'Grady. 'Why, man, if I depended on fees, I should not get butter to my bread.'

'Oh! I beg your pardon,' said Gerald; 'you have doubtless some private resources. Fortunate man, say I! I wish I had.'

O'Grady did not deny the imputation, and so the matter rested for that time; but as either for motives of his own, or from good-nature, he not unfrequently invited Gerald to share his dinner, the intimacy continued till a degree of confidence was established between them that led to momentous results.

'As for my getting into practice here, I look upon it as out of the question, without some extraordinary lucky hit,' said O'Grady one day. 'I mean by and by to go back to old Ireland, where, in some miserable hole or another, I shall settle down as a country doctor, and spend the rest of my life astride of the sharp backbone of an Irish horse. But you ought to get into practice: you have not only abilities but industry; and there isn't a man amongst us who has a better right to get on than you have.'

'And yet this ability and industry you are pleased to attribute to me will scarcely find me in bread and cheese. And the hard part of it is, that when fortune turns her back upon a man in this manner in the beginning of life, one can't—at least I can't—afford to wait till she is in better humour. I suppose practice may come by and by, when I am forty or fifty years of age; but how am I to live and keep up appearances in the meantime?'

'If I had your gift of the gab,' said O'Grady, 'and knew as much about the thing as you do, I'd give lectures on anatomy. In that way you'd get known.'

'But who'd come to them? That is, who'd pay to come to them?—and without fees I couldn't do it.'

'I'll tell you what would bring you fees.'

'What?'

'Not talking alone, I admit; but get subjects—show 'em what you teach, and you'll get plenty of students to come to you, I warrant.'

'I daresay. But how am I to get subjects? Why, K—— gave forty pounds for one lately.'

'I know that,' answered O'Grady; 'but there are ways of doing it;' and then, with his elbows on the table, he leaned across, and in a low voice communicated to Gerald the secret he alluded to.

At that time, and it is not so very many years since these circumstances occurred, surgeons were expected, as much as now, to be acquainted with all the mysteries of the human frame, whilst the legislature placed every impediment in the way of their diving into its secrets. There was no provision made for supplying them with subjects, whilst to obtain them by violating the graveyards was an unlawful act. Of course, however, they were so obtained; many a man lived by the trade, and the surgeons were under the necessity of countenancing the crime, or of remaining in ignorance of what they were bound to know. Some of the dire consequences of this short-sighted legislation became known to the world, and we have a verb adopted into our vocabulary which will carry down the legend to posterity; but it is well understood that there were many more deaths by *burking* in different parts of the kingdom, especially in London, than ever became public, as also that the annals of the resurrectionists would record many strange escapes and frightful adventures.

But to return to our story. Shortly after the conversation alluded to betwixt Spencer and O'Grady, the former made known his intention of giving lectures on anatomy; indeed, he put advertisements into the papers to that effect, whilst it was secretly circulated amongst the students that a subject would be provided for each lecture. As the opportunities for practical observation were so limited as to render such occasions extremely desirable, and as the abilities of the lecturer were well known amongst students of medicine, he had even from the first a pretty good attendance; and their favourable report spreading, soon brought more, especially as the fee was moderate, till at length he could boast of a crowded audience. Of course every man present was aware that the subjects which formed the chief attraction were illegally procured; but it was everybody's interest to keep the secret, and nobody sympathises with laws that run counter to human necessities. So the lectures continued and flourished; and the fame they shed brought patients, till the young surgeon's fortunes improved so far, and promised so well for the future, that he ventured to make his proposals to Mr Manwaring; and the lovers being quite weary of living on protracted hope, they pleaded their own cause so energetically that the father's consent was won, and they were married.

On this event taking place, trusting that his practice would increase, and be sufficient to maintain himself and his wife, Mr Spencer resolved to abandon for ever those midnight expeditions with O'Grady, to which his pecuniary necessities had won him to consent, but which he had never undertaken without feelings of horror and disgust, as well as extreme apprehension of the disgrace of a discovery, which would have probably so far shocked the public as to do him irreparable mischief in his professional career.

For some little time, therefore, he depended on his legitimate profits to furnish funds for his family expenses; but these were not always sufficient, and an empty purse sometimes drove him to his old resources—resources, however, of which his wife remained wholly ignorant. That he gave lectures occasionally she knew, and that he was every now and then out great

part of the night with his friend O'Grady; but how they were employed, though she sometimes wondered, she was never told.

In the meantime Lucy, who having yet no child, had a great deal of time to herself, and who had been accustomed in the country to visit and minister to the poor of the neighbourhood, had joined a society of benevolent ladies, which had originated in a proposal of Mrs Fry and a sister of hers, Mrs Schimmelpenninck—a beautiful woman, who married a German, or rather, I believe, a Dutchman—for the purpose of visiting, improving, and relieving the poor of the metropolis. Each lady had her district appointed, and some of these spread over extremely bad neighbourhoods; but the founders of this society maintained that, in the very worst, there existed no danger for the visitor; and they themselves fearlessly set the example of going into quarters that less enthusiastic women would have certainly eschewed.

Lucy, however, was an enthusiast both in benevolence and religion; and she would have despised herself for refusing to follow where those she looked up to led. She therefore cheerfully accepted the district appointed to her, which was none of the best; and as experience seemed to confirm the opinion of the presiding ladies, she went amongst all sorts of people without fear—witnessing an immense deal of wretchedness, the consequence of an immense deal of vice, from which generally, though the least corrupted, the women were the deepest sufferers, and it was by them she was most gratefully received. Often when the men were sullen the wives expressed by their tears feelings they durst not otherwise give vent to—above all, when they saw their sick children relieved and comforted.

Amongst others there was a house in her district, the ground-floor of which was occupied by some people of the name of Vennell. The family consisted of a man and his wife, and two children; and although they lived in a great deal of dirt and muddle, and apparent wretchedness, they did not seem to be in any want, which was a circumstance the less to be expected that Vennell, from all she could learn, was an idle fellow, who followed no regular occupation, and his wife was a sickly woman, not fit for any.

On the whole it was a very unpromising sort of ménage; and on Lucy's first visit the woman received her so uncivilly, saying, amongst other things, that they wanted nothing of her, that she had not repeated it. Being informed, however, some time afterwards, that Mrs Vennell was very ill, she called, and found her in bed with a rheumatic fever; whereupon she not only sent the district physician to attend her, but being anxious to make an impression on the woman, who, from having rejected her ministrations, she concluded to be more than commonly in want of them, she returned frequently, carrying her such little comforts and indulgences as the funds of the society could afford, and often reading to her for an hour at a time by her bedside. The effect of all this kindness, however, was not very visible. The woman seemed to a certain degree grateful, but she was not softened. She continued close and reserved, and there was a dark ominous cloud ever on her brow that produced an involuntary impression against her. Nevertheless, Lucy, whose enthusiasm was only exalted by difficulties, felt that the worse Mrs Vennell's spiritual condition was the more she was bound to persevere in her efforts to ameliorate it; so she continued her visits, though by this time the woman was able to rise from her bed, and was fast recovering her usual state of health.

One afternoon, late in the month of October, in the year 1816, Lucy had been visiting her district, and finding she had a little wine to spare, which she thought would be an excuse for a call on Mrs Vennell, she went round that way. The woman was up, nursing one of

her children, both of whom were young; but she looked unusually sallow, and, as Lucy thought, the cloud on her brow lowered darker than ever.

'I've brought you a little wine to strengthen you,' she said; 'and as I have half an hour to spare I have something here I should like to read to you.'

'I'm obliged to you for the wine,' she answered; 'but I don't want the reading: it don't do me no good, but just makes me worse like.'

'No,' said Lucy; 'I'm sure what I read can't make you worse; but perhaps it makes you think yourself worse, and that's a good sign. We are in the way to mend when we see how bad we are.'

'I can't mend, and it's no use,' answered the woman; 'it's very well for them as is differently situated; but where one's lot's cast one must hide.'

'Nobody's lot is cast in wickedness,' answered Lucy.

'That's more than you can tell,' said the woman sullenly. 'You gentlefolks come among us, and bring us wine and doctor's stuff, and no doubt we ought to be thankful, for you're nowadays obligated to do it; but for your readings and your preachings they can't do us no good, 'cause our necessities is stronger than words printed upon paper, and when maybe we might wish to be better than we are, we can't; perhaps there's them as won't let us—sometimes want won't let us.'

'All that you say is very sad,' answered Lucy; 'but depend on it wickedness and impiety can never improve anybody's circumstances in the long-run, though it may seem so for a little while.'

'We poor folks ha'n't no time to look for'ards,' returned Mrs Vennell. 'We must find bread for ourselves and our children from one day to another, and if we can't get it by fair work we must get it which way we can.'

'But dishonest ways are like false friends, my good Mrs Vennell'—

'Don't call me good; what I am, I am: I'm no hypocrite.'

'And I like you the better for that, and I've the more hope of you.'

Mrs Vennell shook her head, and could not be brought to admit that there was any hope of her; but on the whole, in spite of this disavowal of amendment, Lucy's opinion of her was improved by these late opportunities of observation, and she inclined to think, from several obscure hints she had dropped, that her husband lived by some dishonest practices, in which the wife took her part more or less, though not without certain regrets and longings after a better state. What Vennell's occupation was she did not know: his wife said, in answer to her inquiries, that he *jobbed about*; but she had never yet happened to see him.

After some further conversation she took her leave, impressed with the idea that the woman was more than usually uneasy and desponding, and that it was not like the despondency arising from want or the apprehension of it, but more like the darkness of a spirit clouded by a troubled conscience. The door of the house opened into a dismal sort of lane, skirted on the opposite side by a dead-wall of no great height, which divided it from a churchyard: one of those churchyards in the heart of the metropolis about which so much has lately been written. As Lucy walked up the lane a man passed her, in company with a deformed lad, who was apparently extremely tipsy. The man was dressed like a labourer, and she looked back after him, wondering if it was Vennell. As she turned her head he turned too, and their eyes met for a moment; but the boy reeled about so distressingly that she hastened on to escape the disagreeable spectacle. Her thoughts a good deal occupied with the state of the woman she had left, she had reached the neighbourhood of her own home before she discovered that her bag was left behind. It was a tolerably capacious one which she usually took with her on these expeditions, as it would carry a small

bottle of wine, or any other little matters she wished to distribute; and as it happened, it contained on the present occasion about five pounds in money, most of it belonging to the society. The loss of it, therefore, would be serious; and although it was already late, and would involve her not being home at the usual dinner hour, she thought, considering where the thing was left, it would be better to return for it immediately; so she retraced her steps as rapidly as she could, entered the door of the house, which, for the convenience of its various inhabitants, stood always open, and groped her way, for it was now quite dark, towards Vennell's room, the door of which was ajar.

'What signifies?' said a man, as Lucy, hearing his voice, paused a moment, hesitating whether to go forward—'what signifies? I told you they wanted one for the lecture this evening, and there wasn't no time to stand shilly-shally. Set on the water to boil.'

'Why couldn't you get one out o' the same place as you got 'em afore?'

'Cause I only got the order this morning; and it ain't so easy, woman. There was a rumpus last night out at Islington, where them doctors was, and they was nigh taken; and that's why they sent to me. Make haste with the water, will you? They'll be here afore we're ready.'

Just as he said these words, and as Lucy, having no notion to what their conversation alluded, was about to advance into the room—whether it was chance, or whether he heard some sound that awakened his suspicions, Vennell turned his head and saw her standing in the passage. To rush out, seize her by the arm, drag her into the room, and close the door, was the work of an instant.

'Don't scream!' said the woman, darting forwards and laying her hand on Lucy's mouth—'don't scream, and you shan't be hurt!'

Lucy did not scream, but she answered with a trembling voice: 'I came back for my bag!'

'I know what you came back for,' said the man; 'I saw you awatching me in the lane just now.'

'Hush!' said the woman; 'she did leave her bag here. Let her go, John—she came for no harm.'

But the man stood sullenly grasping her arm. 'Sit down there!' he said, thrusting her towards a chair—'Sit you down there, I say. Make yourself at home since you are here!'

Terrified into silence, she obeyed, and he went behind her; the woman followed him, and presently she heard a struggle, but no words. An indescribable fear that some mischief was preparing for her made her turn her head, and as she did so her eye fell upon the bed, over which a sheet was spread, but under the sheet there lay a form that made her blood run cold, for she felt certain it was a corpse. At the same time the woman was holding the man's arm, and endeavouring to wrest something out of his hand: the room was lighted only by one dim candle, which shed its gloomy gleams upon this scene of horrors.

'No, John!' said the woman—'no: not if I die for it! She's come to see me, and brought me things through all my sickness!' But the man did not seem disposed to relinquish his purpose, whatever it was; when suddenly his wife made a thrust at him with all her strength, and threw him backwards on the bed.

'Run!' she cried to Lucy—'run!' making a gesture with her head towards the door. 'Turn the key this way; and as you've a soul to be saved, never tell what you've seen this night!'

The fugitive heard the last words as she fled along the passage into the lane; but the man was after her, and she was not six yards in advance of him when she heard the sound of wheels, and a hackney-coach passed. 'Save me—save me!' she cried in a frantic voice; but either the driver did not hear her, or he thought it was some drunken squabble which did not call for his

interference, so he drove forward; but the interruption seemed to have changed Vennell's purpose, for she presently reached the end of the lane unpursued, and making all the speed she could till she found herself in a less dangerous neighbourhood, she stepped into a coach, and arrived at home long after dinner-time more dead than alive. Mr Spencer, she was informed, had been at home, but was gone out to the lecture, very much surprised and somewhat alarmed at her absence. Exhausted and distressed, she went to bed, and waited his return. At eleven o'clock he came home very tired, for he had been out nearly the whole of the preceding night. His first words were words of displeasure: 'Why had she not been at home at dinner-time?'

'Tell me, Gerald,' she answered, 'where were you all last night?'

'What is that to you?' he asked.

'It's as much to me as it is to you to know where I have been this afternoon!'

'I beg your pardon, Lucy; I was out on business.'

'But I want to know what business.'

'My dear little wife, men have often business they cannot trust women with.'

'On this occasion, Gerald, I beseech you trust me! I never before made any inquiries about your midnight excursions with O'Grady, but now I have very strong motives for doing so.'

'What motives?'

'Motives that concern your safety!'

'My safety, Lucy!' he rejoined in some alarm; 'where is there any danger?'

'You were at Islington last night, Gerald!'

Mr Spencer, who had been sitting by the fire warming his feet, rose and walked to the bedside.

'Who told you so, Lucy? I hope you have not been induced by any ridiculous jealousy to spy into my business! If you have, I shall be very angry. It's a thing I could not put up with in a wife, however much I loved her.'

'I see I'm right,' she said, sitting up in bed and confronting him, with a pale and haggard countenance. 'I hoped I was not. I have been praying that my suspicions might be unfounded. You know a man called Vennell, Gerald?'

'Vennell! What do you mean?'

'A man that lives at the back of St S—— Church. He's a murderer!'

'Nonsense! I see your mistake. But what in the world has brought you in contact with Vennell?'

'There's no mistake: I tell you he's a murderer, and it's you that makes him one! You've been lecturing to-night?'

'Of course I have,' answered Mr Spencer, still incredulous, and still half angry.

'And you had what you call a—subject?'

'Well, if I had? I'll tell you what, Lucy,' he said sharply, 'if I hadn't had subjects, you wouldn't be Mrs Spencer; so mind your own business, and don't be foolish!'

'Oh Gerald, Gerald, how the love of gain blinds you to right and wrong! The man, Vennell, is a murderer, I say; and I shouldn't be here to tell you so now but for his wife, who enabled me to make my escape. If it hadn't been for her, you would perhaps have found a subject to-night on your dissecting-table you little looked for!'

'In the name of God, what do you mean, Lucy?' said Spencer, at length roused to a belief that there was something more in this agitation of hers than he had believed.

'Tell me, Gerald,' she said, 'was it a man or a woman you had to-night?'

'A man—at least, a boy.'

'I thought so,' said Lucy shuddering. 'A deformed boy?'

'Yes; a deformed boy! Why?'

Then amidst tears and anguish she told him all that had happened: how she had visited the woman, and how strange her demeanour had appeared; how she had met the man and the boy, and the state of intoxication the latter was in; how she had forgotten her bag and returned for it; and finally, how she escaped.

His fears made him misinterpret my looking back at him; and when he saw me in the passage, he no doubt thought I had witnessed the murder. But I saw no blood,' she said; 'how was he killed?'

'Suffocated,' returned Mr Spencer; 'but I supposed by accident. It was I that was in the coach,' he said. 'I was going to fetch the body, and I remember hearing a woman cry, but I little imagined whose voice it was!'

'Let us be poor to the end of our days, Gerald,' said his wife, 'rather than get money by such unholy means!'

And Mr Spencer was sufficiently shocked and alarmed to follow her advice.

What to do about Vennell he did not know. If he accused him, the man had it in his power to make very unpleasant disclosures regarding himself and O'Grady; and besides, Lucy was extremely unwilling to implicate the unhappy wife. Finally, after some consultation, it was agreed to warn Vennell of his danger, and then to take such measures as would prevent a recurrence of the crime. But the discovery of Williams and his associates immediately afterwards led to a full exposure of these dreadful practices, and to a more judicious legislation, which put a stop to them by removing the motive.

Lucy's bag was returned, with all its contents safe, by Mrs Vennell, and the man I have called by that name was transported at the same time that Williams was executed. The young surgeon, whose real name is not of course here given, rose afterwards to considerable eminence in his profession, and, I believe, died within the last ten years.

TOTAL ECLIPSE OF THE SUN.

THE total eclipse of the sun, which takes place on the 28th of this month, is one of those phenomena of nature which cannot be witnessed without the most intense interest. Partial eclipses of the sun, and even the great annular eclipse, which was so distinctly visible in this country in 1836, though highly imposing phenomena, are far inferior to the complete and total obscuration of that luminary. The event is described by those who have witnessed it as 'the most awfully grand that man can behold, and the most interesting,' because on that occurrence we are permitted a hasty glance at some of the secrets of nature which cannot be seen on any other occasion. When we read in ancient times of the two armies of the Lydians and Medes, even in the very midst of a furious battle, awe-struck and desisting from the combat at the obscuration of the sun, we cannot wonder that such a spectacle should deeply impress more refined and more intelligent observers.

Everybody knows that an eclipse of the sun is caused by the opaque body of the moon coming between us and the sun; but all are not aware of the difference of circumstances which causes at one time an annular and at another a total eclipse: these circumstances are, however, very easily explained. If you take a piece of white paper, cut it into a circle of about four inches diameter, and lay it on the table; then, standing before it, take a penny-piece, and shutting one eye, so place the coin between you and the paper that, looking at both with your open eye, you see the former cover the centre of the paper, and leave a white circle uncovered: this will represent the phenomenon of an annular eclipse. Then gradually move the penny-piece nearer and nearer your eye, till it comes to within about two feet, or to a point where the coin as now seen completely covers and

obscures the whole circumference of the paper circle: this will represent the phenomenon of a total eclipse. This experiment illustrates an invariable law of vision—that bodies near the eye appear larger than those at a distance; or, in other words, that objects diminish in size as they recede from the eye or centre of vision. Now the diameter of the sun is about 400 times larger than that of the moon, and the mean distance of the former luminary is about 400 times greater; so that the diameters of the sun and moon as seen by us are nearly the same. But as the earth's orbit is elliptical, with the sun in one of the foci or centres, at certain times the sun is nearer to us, and at other times more remote; consequently his diameter increases and diminishes somewhat to our sense of vision. It is the same with the moon. Her orbit is also elliptical, and, consequently, at certain periods of her revolution round the earth, she too appears with a larger disc than at others. When it so happens that a conjunction occurs between the sun and moon, at a period when the moon's disc is at its smallest and the sun's at its largest, then the moon will not entirely obscure the sun, but a small circular rim of this luminary will be visible: on the other hand, when the reverse position of these bodies occurs—that is, when the sun is at his greatest distance from us, and his disc the smallest, while the moon is at her nearest point to the earth, and her disc the largest—then a total eclipse of the sun is the consequence. As the greatest difference, however, occurs on the moon's disc, the occurrence of a total eclipse is mainly dependent upon her relative position. From the well-known laws of the moon's revolutions it is evident that eclipses, either of the sun or moon, can only be of occasional and comparatively rare occurrence. Still more rare must be the concomitant circumstances which bring about a total or even an annular eclipse.

The eclipse of next Monday will only be partial as seen in Britain; but over a portion of the continent of Europe it will be total. Entering Norway near Bergen, the shadow crosses both coasts of Norway, both coasts of Sweden, and the eastern coast of the Baltic; then ranges through Poland and the south frontier of Russia, across the Sea of Azof, through Georgia to the Caspian Sea. The following towns are thus within its range:—Christiania, Gothenburg, Carlsrona, Dantzic, Konigsberg, Warsaw, and Teflis. All these places are now of easy access to travellers; and no doubt, with the present facility of locomotion, many will indulge themselves in a view of the spectacle.

To those who witnessed the annular eclipse of 1836 we need not describe the general effect. The early congregation of people of all ages out of doors on a beautiful cloudless Sunday; the eagerness with which the first approach of the moon's dark disc was watched; the intense interest with which its gradual progress was marked; the awe which the pervading gloom and stillness as of approaching night excited; and the singular effect which this unusual interruption of the order of every-day nature had on the unreflecting brute creation—birds ceasing their song, deserting their feeding-ground, and flying to the thickets to roost—cattle looking up in dumb amazement to the portentous sky—and dogs whining and howling in terror!

M. Arago strikingly describes the total eclipse of 1842. The whole circumference of the moon was seen by him through his telescope while yet she had entered only about two-thirds of the sun's diameter. As the total eclipse approached, a strange fluctuation of light was seen both by Arago and others upon the walls and on the ground—so striking, that in some places children ran after it, and tried to catch it with their hands. Mr Airy, the astronomer-royal, describes the singular ring of light which surrounded the moon's circumference, commencing on the side of the moon opposite to that at which the sun disappeared. In some places th'

ring or corona was seen double. Its texture appeared in some places as if fibrous or composed of entangled thread; in some places brushes or feathers of light proceeded from it. The appearance of this luminousness was very striking and unaccountable. The general opinion was, that it emanated from the sun; while more ancient writers have supposed it to be the atmosphere of the moon. 'In the general decay and disease which seemed to oppress all nature, the moon and the corona appeared almost like a local disease in that part of the sky.' But the most remarkable of all the appearances were the red mountains or flames apparently projecting from the circumference of the moon into the inner ring of the corona. These were seen and figured under different aspects by observers at various stations. The first impression was, that they were parts of the sun—elevations estimated at thirty thousand miles; but then the difference of form which they assumed as seen at different places became an objection to this theory. M. Faye conceives these appearances to be due to a sort of mirage or deception of vision.

Of the awful effect of the total obscuration, and of the suddenness with which it came on, it would be difficult to give an idea. The darkness is described as 'dropping down like a mantle;' the clouds seemed to be descending; the outlines of the horizon became indistinct, and sometimes even invisible; and a moral awe hung on the livid-looking countenances gazing around. The effect on the brute creation was also extraordinary. In one case a half-starved dog, which was voraciously devouring some food, instantly dropped it from his mouth when the darkness came on. In another a swarm of ants, which were busily carrying their burdens, stopped, and remained motionless till the light reappeared. A herd of oxen feeding in a field collected themselves into a circle, and stood with their horns outwards. Some plants, such as the convolvulus, closed their leaves as at night. At Venice the darkness was so great that the smoke from the steamboat funnels could not be seen. In several places birds in their flight came against the walls of houses. When the sky was clear several stars were seen, and in several places a reddish light was perceived near the horizon. A heavy dew fell at Perpignan. Mr Airy mentions an anecdote related to him by M. Arago of the captain of a French ship who had made most careful arrangements for taking observations in his vessel. When the darkness came on, however, all discipline was at an end; every one's attention was directed to the general phenomenon; and thus many minute observations were lost. For taking observations it may be mentioned that no particular astronomical skill is necessary, and few instruments—a telescope, stop-watch, common prism, and polariscope, include the more essential of them. A photogenic apparatus, either Daguerreotype or Talbotype, or both, by which a number of views could be obtained during the successive stages of the phenomenon, and at different localities, would be by far the most interesting and useful of the observations which travellers and men of science could contribute.

CONFESSIONS OF A PICTURE-DEALER'S HACK.

I AM going to make a clean breast of it, for the repose of my conscience, if I may be supposed to have any, and as some sort of laggard justice to that very numerous class towards whom a stern necessity has compelled me to play the impostor. I was once a student of nature, and enthusiastic in my studies—nourishing dreams of reputation and celebrity, with all the pleasant and agreeable accompaniments attendant upon them. Long years of painful experience have at length brought home to my consciousness the slow and unwillingly-acknowledged conviction, that I have wasted the thread of life in the pursuit of a vocation never intended for me; that, though once profoundly imbued

with the sentiment of art, I never really possessed the 'faculty divine,' without which success in the profession is hopeless. I say I *once* possessed the sentiment of art—because I don't pretend to it now; even that is gone, clean gone—frittered and fooled away by the conventional and technical din of the studio and the cant of connoisseurship. It is a wretched fact, that to me the whole world of art, so far as its aesthetic influence is concerned, is nothing but a blank, unless perhaps something worse. The once magic creations of Raphael, Corregio, Titian, and Rembrandt, are resolved, through the detestable process my mind has undergone, into mere masses of oil and varnish, canvas and colour. Where others behold with awe the expression of a god-like idea, the embodiments of intellect and passion, or the incarnations of physical or mental loveliness, I see nothing but paint—reds, browns, and yellows, madders and ultramarines, with the scumblings, and draggings, and glazings, and scrapings, and pumice-stonings, and the thousand artifices employed in getting up an effect. It were well if this were all. I could be well content never to look on picture more, if the face of nature would return to me again under the aspect it wore in the days of my boyhood. But, alas! it cannot be. To me the

'Meadow, grove, and stream,
The earth, and every common sight,'

are but suggestive of paint in its myriad mixtures and combinations. The gleam of sunshine upon a field is but a dash of Naples yellow; the dark gloom of evening closing o'er the distant mountains, speaking of infinite space and distance to the unsophisticated eye, is nothing to me but a graduated tint of indigo, red and white: the impenetrable depth of a yawning cavern, dimly discernible amid the sombre shades of a mountain gorge, though it may tell a tale of romance and mystery to others, is nothing upon earth to me but a dab of Vandyke brown. Nay, the boundless sky, the over-arching canopy that wraps us up in brightness or in gloom, is in my view, according to circumstances, but a tube of diluted cobalt, or a varied combination of grays and reds, and yellows and whites: while the glorious sun himself figures in my imagination, precisely as he does in the pictures of Claude Lorraine, as a one-shilling impression of a flame-coloured tint.

How this came about perhaps my history will shew. I shall make it as brief as I honestly can: may it prove a warning to the youthful aspirant for artistic fame, and incite him to a candid and timely investigation into the reality and extent of his creative faculty! One thing I know—it will prove a revelation of some value to collectors and connoisseurs of all ages and grades, provided only that they have yet modesty enough remaining to doubt the infallibility of their judgment.

I was born in one of the suburbs of the metropolis, and my earliest recollections are associated with the palette and the studio. My father, whose sole child I was, was an artist of very considerable talent, who, with a real love of nature, combined a ready hand and a facility of practice which enabled him to produce a multitude of pictures though he died young. My mother, who worshipped him with a devotion that knew no bounds, relieved him of every care unconnected with his pursuit. It was her business to dispose of his productions, which, being all of small size, rarely exceeding twenty inches in length, she carried to town, and sold to the dealers for as much as they would bring. In these perambulations, when I was big enough to take the long walks, I sometimes accompanied her, and when the sale was successful, generally got a cake or a toy for my share. Besides my mother, my only playmate was a small lay-figure, which it was the quiet delight of my childhood to cherish and fondle with an affection which I cannot now comprehend. My father's pictures never realised much during his life. They

were chiefly landscapes of a very simple style of composition, and scores of them had no other figures than a woman and a child, of which my mother and I were the models; and I remember distinctly that when a pair of them realised five pounds, it was the occasion of a rejoicing and a hot supper, which I was allowed to sit up and partake of. My poor father died before I was eleven years of age; and then his performances rose into sudden repute, selling rapidly for ten times the sum he had ever received for them. By degrees they all disappeared from public view, being bought up by the best judges, who during his life never condescended to notice the artist. My mother followed my father to the grave before her year of mourning had expired; and I, for the time heartbroken, was transferred to the care of my father's only brother, also an artist, though of a very different stamp. He sent me for two years to school, where, in the society of children of my own age, I soon forgot my griefs. Before I was fourteen my uncle bound me apprentice to himself, to make sure, as he said, of some sort of recompense for the trouble he would have in teaching me. He was a portrait-painter, at least so said the brass-plate on the door of the house in Charlotte Street; but very few and far between were the sitters who came to be limned. His principal occupation was that of cleaning and restoring old and damaged pictures, and in this he was employed mainly by the dealers, who allowed him but a sorry remuneration. He had, too, a small connection of his own, to whom he occasionally sold pictures, bought at the sales in a woful condition for a few shillings, and carefully got up by himself. With him I worked hard from morning to sunset for seven years, in the course of which period I copied an immense number of pieces, nearly all the copies being sold to country dealers, who came periodically to town and cleared them off. I learned thoroughly the difficult art and mystery of picture-cleaning; acquired of necessity some skill in portraiture; and prosecuted, whenever opportunity offered, the pursuit of landscape, in which I was resolutely determined upon gaining a reputation.

With this view, when the term of my indentures had run out, I bade adieu to my uncle, who made no attempt to alter my purpose, and commenced the world on my own account, devoting my whole time and energies to my favourite pursuit. I first painted a couple of pieces of a small size, and sent them to the Street Exhibition, paying the then customary fee, which a wiser policy has since abolished. I felt overjoyed to hear that my pictures were hung, and hastened to look at them as soon as the doors were opened to the public. My hopes were dashed away by the sight of my two little productions, hardly covering more than a square foot of canvas each, suspended as telescopic objects high aloft beneath the gloom of the ceiling; while whole fathoms of the 'sight line' were choked up with the 'unmitigated abominations,' as the reviewers justly styled them, of one of the members of the committee, whom nature had cut out for a scavenger. I had gone in debt for my frames, which were returned to me at the close of the exhibition smashed to fragments. I could never afterwards afford to repeat the experiment.

I now began to paint for the dealers, thinking, as I had but myself to maintain, that I might get on with frugality, and in time tread in the steps of my father. The dealers shook their heads at my performances; and one, with more candour than the rest, produced one of my father's pieces, bought of my mother for thirty shillings, which he pronounced 'a little gem'—shewed me how crisp was the touch, how pure and sparkling the colour; how vigorous, and yet how playful, was the handling; and how simple and graceful was the composition. I endeavoured to profit by the lesson; but necessity drove me to the market with my

work unfinished, and for three years I maintained a hapless struggle with privations of all sorts, buoyed up only by the fervid ambition of excellence in my art. When the dealers would not buy my productions, I often left them in their hands to be sold on commission. When they did sell, I rarely discovered what they sold for; but from information accidentally obtained with regard to some few, I found that the average commission was about seventy-five per cent., leaving the other twenty-five for the artist.

I grew tired of starving in pursuit of improvement, and in the hopes of mending my fortune started a portrait club. The members were the frequenters of a Free-and-easy, who subscribed a shilling a week each, and drew lots for precedence; but they believed in beer, and had no faith in honesty. As each one received his portrait, he discontinued his subscription towards the rest, and I received next to nothing for painting the last half-dozen. The landlord, too, wished me at Jericho, as his customers took to bemusing themselves elsewhere, to avoid my eloquent appeals for the arrears. I bade a final adieu to their ugly faces, with a feeling of profound contempt as well for the department of art they encouraged as for the patrons of it, and returned to my garret, to cogitate some new mode of renewing my exhausted funds. I made a couple of sketches which occupied me a week, and took them to a pawnbroker, who lent me fifteen shillings upon them. I thought, as I threw the duplicates into the Thames, that though this would hardly do—taking the cost of canvas and colours into account—I might manage it by a little contrivance; so I procured half-a-dozen canvases of the same size, traced one subject—comprising a windmill, an old boat, and a white horse—upon them all, and making one palette do for all, got up the whole six in ten days. These I pawned for an average of eight shillings a piece. It was long since my pockets had been tightened with such a weight of silver; but with the new feeling of independence arose one of shame and degradation, which, however, I soon stifled. I repeated the same subject again and again; and grew so expert at length with my one picture, that a few hours sufficed to finish it. I kept a register of my numerous 'uncles,' taking care never to appear twice at the same place with the same picture. But this trick could not last. At the annual sale of unredeemed pledges the walls of the auction-room were covered with a whole regiment of repetitions amidst the jeers and hootings of the assembled bidders. My plan was blown, and I dared not shew my face to a pawnbroker. It was vain to send pictures to be pledged by another hand, the fellows knew my touch too well to be deceived. I tried again with original sketches, but it was of no use: everybody believed that I had a score of reduplications in store; and I was forced at length to abandon the pawnbrokers to their discrimination. I returned again to the dealers, but each and all had a copy of my windmill, old boat, and white horse hanging upon hand; and, pronouncing my productions unsaleable, declined to purchase. In this dilemma I was driven to the 'slaughter-houses,' or nightly auctions which are opened weekly at the West End, and constitute the last wretched refuge and resource of destitute daubers. Here I figured for some time, wasting my days in unprofitable attempts to meet the demands of a miserable market. I grew shabby and dispirited, and sank into the depths of poverty. Often I could not meet the expense of canvas, and painted on paper or millboard, or even on an old shirt stretched upon a worm-eaten strainer, begged or bought for a few halfpence from the liners' journeymen. Sometimes, aroused to exertion by a rekindling love of art, I would walk up to Hampstead or out to Norwood, and bringing back a subject, paint it up with all my old enthusiasm; but it availed me nothing: the picture was generally sacrificed for a few shillings; and even though it were

afterwards sold for a fair price, the profit had been shared in the knock-out, and I was none the better.

In this exigency I gladly complied with an offer made me by Mr Grabb, a carver and gilder with whom it had been my wont at times to exchange pictures for frames. In addition to his regular business he dealt in pictures to a great extent, had a large country connection, and, living himself in Soho, kept an extra shop in the city, where he always made an extraordinary show of colour and gilding on dividend days, with the especial design of catching the 'country gabies,' as he called them, cash in hand. With him I boarded and lodged, and received a small weekly salary, in return for which I was to occupy myself ten hours a day in making new pictures or restoring old ones, according to the demand. He had picked me up just in time for his purpose. A day or two after I entered upon my duties, he encountered a country baronet at a sale which had lasted for nearly a week. The man of title had bought between 200 and 300 lots, with the view of decorating a mansion which he was then building in Sussex; and having no place at hand to contain his numerous purchases, had accepted the ready offer of my patron to warehouse them for him for a season. The purchases arrived on the day of clearance, and with them the delighted owner, who had bought a whole gallery-full for about £500. They were all stacked in the silvering-room, and my employer was commissioned to select such of the number as he judged would do credit to the taste of the possessor, to restore them to a good condition, to regild the frames of such as required it, and to dispose of the rejected pieces for what they would fetch, carrying the proceeds as a set-off against his bill. Mr Grabb knew perfectly well what to do with such a commission. The next day I was summoned to a consultation, and having locked the doors, the whole batch was gone over, and carefully scrutinised with the aid of a bowl of water and a sponge. All the large pictures (some were as big as the side of a room), many of which I felt bound to condemn as worthless, were set aside for repair and framing; while a select collection, amounting to about thirty of the smallest, best, and most saleable cabinet sizes, were thrown into a corner as unworthy of attention. For these, which were nearly worth all the rest of the collection put together, he ultimately made an allowance of £15 off his bill, amounting to several hundreds, the cost of gorgeous frames and gilding for trumpery of no value. It took me four months to prepare such of the pictures as wanted cleaning for their gilded jackets, and it would have taken as many years had proper care and leisure been allowed for the operation; but I was admonished to follow a very summary process—to get off the dirt and old varnish from the lights, and to leave the shadows to shift for themselves, trusting to a good coat of varnish to blend the whole. One immense sea-fight, which defied all our solvents to disturb its crust, Grabb undertook himself. Stripping it from the stretcher, he laid it flat on the silvering-slab, and splashing water on its surface, seized a mass of pumice-stone twice as big as his fist, and scrubbed away with bare arms, like a housemaid at a kitchen-floor, until admonished by the tinge of the water that he had done enough. The canvas was then restrained, and turned over to me to paint again what he had scoured away. As the whole rigging of a seventy-four was clean gone, I began the slow process of renewing it; but he would not hear of that, but bade me bury everything in a cloud of smoke as the shorter way of getting over the business. When the whole were ultimately carted home and hung up in his new residence, the baronet was delighted with his gallery, and with this picture in particular, which certainly differed more than any of the others from its original appearance.

The baronet's commission being now settled and

done with, the rejected pictures were withdrawn from their hiding-place and confided with many precautions to my most careful treatment. I laboured *con amore* in their restoration, and Grabb reaped a little fortune by their disposal. He kept me well employed. Every picture which came in to be framed or repaired, if he judged the subject saleable, was transferred to me for copying, and sorry indeed should I be to swear that the original invariably found its way back to the owner.

Soon after my domiciliation at Grabb's my uncle left Charlotte Street, and with a large cargo of English pictures emigrated to New York, where he sold his venture to good advantage. In one of the southern cities he found patronage and a wife, and grew into consideration ere he died.

I remained seven years with Grabb, and during that period attained a wonderful facility in the production of copies, and so close an acquaintance with the method and handling of some of the living London artists, as occasionally perplexed even themselves. This talent my employer turned to good account by selling forgeries of mine as the original sketches of painters of note and reputation; and at the decease of any one of them he supplied me with canvas and panels procured from the colourmen they had dealt with, and set me about the manufacture of sketches and unfinished pictures, which were readily bought up as the relics of celebrated geniuses.

At the close of my seventh year business fell short. True there was plenty for me to do, but owing to distress in the manufacturing districts, the sale of pictures, as is invariably the case at such seasons, very much declined. Still my principal managed to get rid of his stock, though not in the regular way of business: he packed off a portion of his best goods to country agents, and to old customers on approval, and crammed the shop in the city to overflowing, where also he took to sleeping at night, leaving me and the shop-boy sole guardians of the house in Soho. One morning about two o'clock, while soundly sleeping in my garret, I was aroused from my rest by a thundering noise at my room door, and the affrighted cries of the boy, calling upon me to arise and save myself, for the house was on fire. I dashed out of bed, contrived to huddle on a portion of my clothes, and opened the door. The room was instantly filled with smoke; the boy had already escaped through the trap-door in the roof, which, being left open, acted as a flue to the fire, the flames of which were rapidly ascending the stairs. I had no time for reflection, nor sufficient presence of mind to snatch, as I might have done, the few pounds I had hoarded from my drawer; but scrambling after him as I best might, found myself in a few minutes shivering on the roof of a neighbour's house, in my shirt and trousers, now my sole worldly possessions. A servant-girl let us in at a garret window, and I immediately despatched the boy for his master, whom, however, I did not see till the morning, when he coolly informed me that he was a ruined man, and that I must look out for some other employer. He paid me a small arrear of wages due, and gave me a faded suit of his own to begin the world afresh. I may add that Grabb subsequently received two thousand pounds insurance money; that in two years after he was so unfortunate as to be burned out again, and received fifteen hundred; that he was overtaken by the same calamity twice afterwards in New York; and returning again to London, was again burned out: whereupon the office in which he had insured politely informed him that he might recover the money if he could in a court of justice—they should not else pay it. He never instituted any proceedings, but carried on business for ten years without insurance and without accident.

I could not afford to remain long idle; and being now pretty well known to a certain portion of the trade, I was not long of obtaining employment. My

next engagement was with Sapper, who kept a shop for the sale of pictures, together with large warehouses, in the neighbourhood of Covent Garden. I thought myself pretty well versed in the art and mystery of picture-making, and conceived that after my long experience under Grabb I had little if anything left to learn. This worthy undeceived me effectually. In my former place I had been the only hand; here I found three companions, each far more experienced and more clever than myself. One, a gentleman-like old fellow, painted nothing but Morlands from one year's end to the other. He had been a contemporary of that eccentric genius, and had mastered his style so effectually that he would have deceived even me had I met with his forgeries elsewhere. He was provided with a complete portfolio of every piece of Morland's which had ever been engraved, besides a considerable number of his original chalk drawings; he had, moreover, pentographed outlines of the known size of the original paintings, which outlines were transferred to the canvas in a few minutes by means of tracing-paper, and painted in from the prints, which were all slightly tinted after the originals for his guidance. A man of about five-and-forty, a Manchester artist, of thorough training and admirable skill in his department, did duty every morning from eight till twelve o'clock as the celebrated Greuze; after that hour he disappeared, to attend to his own practice as a portrait-painter. I recognised at once in his work the source of the numerous admirable transcripts of that master which I had been for years in the habit of occasionally encountering both in sale-rooms and private collections. The third was a Dutchman, whom Sapper had picked up on a picture-tour in Holland, and engaged from admiration of his marvellous imitations of Teniers, whose works, with others of a similar school, he was constantly employed in imitating with astonishing fidelity and success.

Among these companions I was directed to set up my easel and commence operations; and a small picture of Patrick Nasmyth was put into my hand to be copied in duplicate. I was directed to mix a certain substance with every tint that was laid on with any thickness, to insure its drying speedily 'as hard as a brick,' lest the fingernail of a wide-awake customer should detect the softness of new colour. The panels put into my hands, though snow-white with the prepared ground on the one side, were black with age on the other, and spotted over here and there with the cracked sealing-wax impressions of well-known connoisseurs, to intimate that the picture I was about to commence had already passed through the hands of several collectors of repute. When I had finished them, both being done within a week, they were, after a few days' drying, slightly glazed with a weak solution of liquorice to give them tone: one was varnished, framed, and readily sold from the window; the other laid by in a garret, to await, with a hundred more, its turn for exportation. My next job was a magnificent Cuyp, which had not many weeks before been knocked down by auction for eight hundred guineas, and which was confided to Sapper for the purpose of removing the old varnish and substituting new, and for framing. As nothing else was required to be done, the picture might have been returned to the proprietor within a week or ten days; but Sapper determined from the moment he saw it to possess a facsimile, and I was set about the manufacture of one forthwith. A panel was prepared of the precise age, from three oak planks selected from the stores of a dealer in old houses, and dyed to the required tint by a strong infusion of tobacco. By means of new bread kneaded in the hand the two broad burgomaster's seals on the back were counterfeited beyond the possibility of detection, and I commenced upon the surface with all the industry and skill I was master of, stimulated to the task by the prospect of an extra guinea. The picture had been promised to the owner in a week,

my employer knowing well enough that it would take me four or five weeks at least to make the copy. It was in vain that one message after another came to urge the return of the picture, and that the owner himself drove up in his carriage, and remonstrated in no measured terms with Sapper, and threatened him with the interference of the law. The knave had a reply ever ready upon his lips: 'He was determined to do justice to so exquisite a work of art, and he would not, he could not, be induced to hurry it; his reputation would suffer should any mischief happen to the painting; which he would prevent, in this case at least, even at the risk of disobliging his patron.' At length, after nearly six weeks' delay, I had completed the copy; and then Sapper himself, in less than an hour, licked off all the old varnish with a wisp of wadding steeped in 'the doctor,' gave it a new coat of mastic, clapped it into an elegant and appropriate frame, and despatched a note to the proprietor requesting his attendance and approval. He came, and was delighted with the aspect of his picture; while the dealer, with a thousand modest apologies for the delay, assured him that the task had been one of great labour and anxiety both to him and me, and that he could not, consistently with justice to the master, have accomplished it sooner. The wealthy connoisseur swallowed his lies with evident relish and satisfaction, reiterated his thanks again and again for the marvellous manner in which the picture had been got up, and paid at the same time a bouncing bill for a process which a crown would have amply recompensed. There remained now nothing to be done to the copy in order to render it a tolerable facsimile of the original, but to imitate the close reticulation of cracks—the ineffaceable work of time—which covered every square inch of the surface. This was accomplished in the following manner:—After the copy had stood to dry for a fortnight, by which time, thanks to certain nostrums ground up with the colours, the whole had grown as hard as a pantile, it was taken down, slightly toned with a warm brown to give it age, and when again dry, carefully coated with size; the composition of which, as it is already too well known among the knaves of the profession, and can be of no manner of utility to any honest man, I may be excused from explaining. This was no sooner tolerably dry, than it was followed by a liberal coating of varnish floated over the surface, and left to harden in a room free from dust. The inevitable result from such a process is, that the varnish is no sooner set than it begins to crack, owing to the expansion of the understratum of size; and this cracking may be regulated by an experienced hand, in varying the proportions of the ingredients used in compounding the size, and in other ways, so as to give rise to fissures of all widths, from the thickness of a hair, as exhibited on the panels of the Dutchmen, to that of a crown-piece, as they are beheld in the present condition of most of the works of Sir Joshua Reynolds. With the width of the cracks the size of the reticulations also varies; ranging from the diameter of a small shot to that of the palm of the hand. When very fine, the cracks are not visible until made so by rubbing impurities into them, for which purpose the dust which settles upon a polished table, wiped up with an old silk handkerchief slightly oiled, is usually preferred. The difference between a picture thus cracked by artifice and one cracked by the operation of years or centuries cannot, other things being equal, be possibly discerned by the closest inspection. The only way to get at the imposture would be to remove the varnish, either by friction or solvents, when the fissures would be found in the true picture to extend through the paint, while from the manufactured copy they would disappear with the varnish—a rule, however, which would not be without exceptions.

One morning our old Morland found himself standing still, not from any want of subjects or demand for

them, but because the young fellow, whose business it was to line canvases and prepare panels for us all to work upon, had been out on one of his periodical drunken bouts, and had nothing ready for him. Sapper, coming up and seeing him idle, requested him to go to a broker's in Red Lion Street and 'crab' a picture for him, as he wanted to buy it. When the old fellow had gone off on his errand, I asked the Greuze what he was gone after. 'Oh,' said he, 'the broker wants L.10 for a bit of Gainsborough, and the governor wants it for fifty shillings—that's all.' I soon found that 'crabbing' is the art of putting a man wanting judgment in the article he deals in out of conceit with his goods. Two or three *accidental* inquiries, with demonstrations of amazement at the 'enormous' price asked, are found materially to lower the demands of the seller. In this instance Sapper eventually succeeded in getting the picture he wanted at his own price; and after disposing of several copies in various quarters, ultimately sold it again for its full value.

He sold pictures on commission; and these he managed, when it was worth his while, with a complex kind of adroitness which is worth recording. I shall chronicle one instance: a gentleman who had given L.800 for a famous production of one of our first living artists, grew discontented with its too great size, and sent it to Sapper to be disposed of, professing himself willing to lose L.100 by the sale, but not more. Sapper offered it for L.1000, and at length obtained a bidding of L.700, which, as he observed, would have left nothing for himself. He immediately wrote to the owner, informing him that he had an offer of L.200 and a fine Claude, which he requested him to come and inspect, as he did not like to refuse the offer without the owner's sanction. Meanwhile one of Hofland's beautiful transcripts of Claude, procured in exchange at the nominal price of sixty guineas, was mounted on the easel, and, covered with a curtain, awaited the inspection of the victim. He came, and, deceived by the really fine execution of the picture—the counterfeited cracks of age, the palpably Italian style of lining, in which Sapper was skilled to a miracle, and the Roman frame and gilding—concluded the transaction, giving the rogue a small commission for his trouble, who, in addition to that, pocketed the difference between L.500 and the value of the pretended Claude, which would have been well sold at L.50.

Though Sapper's house was filled with works of art of every imaginable description, overflowing with pictures from the cellar to the garret, including every species of rubbish gathered from the holes and corners of half Europe, yet the contents of his dwelling afforded but an inadequate idea of the extent of his stock. He had 'plants' in the hands of numerous petty agents, the owners of small shops in suburban highways, who sold for a trifling per-centage. He had here a Madonna and there a Holy Family in the keeping of a lone widow or a decayed spinster, whispered about as pieces of great value, which the holders were compelled to part with from the pressure of domestic misfortune or embarrassment; he had traps and baits lying in wait for the inevitable though long-deferred rencontre of customers whom bitter experience had rendered wary, and who had long ceased buying in the regular market; and he had collections snugly warehoused in half the large towns of the empire, waiting but the wished-for crisis of commercial prosperity to be catalogued and sold as the unique collection of some lately defunct connoisseur, removed to — for convenience of sale.

Among the acres of what he called his gallery pictures was one with an area of some hundred square feet, upon which he had bestowed the names of Rubens and Snyders. It had hung for years upon hand, and was at length disposed of by the following ingenious ruse:—A gentleman who had appeared at different

times desirous of treating for it—now negotiating an exchange, now chaffering for a cash price—hovering on the edge of a resolution, like Prior's malefactor on the gallows cart—at length absented himself, and withdrawing on a visit to B——, appeared to have relinquished the idea of dealing. Sapper, knowing that a picture-sale was shortly coming off in the town to which his dallying customer had flown, and knowing, too, that he could do as he chose with the auctioneer, who was an old chum, followed close upon the heels of the tardy bidder, taking the enormous picture with him. As the cunning rogue had calculated, the instincts of the would-be-buyer led him to the sale-room, where his astonishment was unbought at beholding the picture he had so long coveted at length condemned to the hammer. On the following day, when the sale came on, Sapper, who had not shewn his face in the town, lay ensconced in a snug box behind the fence over which the lots were consecutively hoisted, and here, concealed from view, he ran up the picture against the eager bidder to the full sum he had offered for it in London, and bought it in against him in the name of an Irish nobleman. So soon as the doors were shut, the picture was again off to London, and the next day appeared in its usual place on the wall of the staircase. In a fortnight after the gentleman walks into the shop, exclaiming: 'Ha, Sapper, so you have parted with the picture—you might as well have closed with my offer.' 'I don't understand you,' said the other—'I have parted with no picture that I know of which you had any inclination for.'

'I mean the Rubens and Snyders,' replied the gentleman; 'it was sold at B—— about a fortnight ago, and fetched about what I offered for it. I must know, for I was there myself, and bid for it.'

'I don't pretend to contradict you, sir,' retorted Sapper; 'all I know is, that the picture you speak of has never been out of my house, and, what is more, is not likely to go, unless I get my price for it. Now I think of it, there was a young fellow from B—— up here last summer, who gave me ten pounds for permission to copy it; and a capital copy he made: had I known he was so good a hand I should not have let him do it for the money. You will find the picture in its place if you like to step and look at it.'

Up walks the bewildered gentleman, and can scarcely believe his eyes at beholding the old favourite in its old place. Sapper follows with a sponge and water, and cleaning down the face of the painting, expresses his astonishment that any one should mistake a copy, however cleverly done, for such a fine work as that; adding, that if the copy brought so good a sum under the hammer, what must be the actual value of the original? The inference was inevitable, and the speedy result was the consummation of the purchase, not without some show of unwillingness on the part of Sapper, who appeared impressed with the notion that he was submitting to a tremendous sacrifice.

I cannot, nor need I, continue these details. I have said enough to warn the unwary, and to arouse the watchfulness of the wise. Is it wonderful that the moral atmosphere in which I have lived, and moved, and had my being, should have had the effect upon my mind which I have described at the commencement of this paper? When connoisseurs and critics stand gasping with breathless raptures in contemplation of elmy mixtures of megilp and burned bones; when they solemnly invoke the shades of the mighty dead, and ejaculate their maudlin rhapsodies in reverential whispers, as though hushed to silence by the spirit of departed genius in the presence of a rascally forgery perpetrated for a wage of thirty shillings—what marvel if one whom hunger and necessity have driven to deceit should lose all capacity for the proper appreciation of art or nature either, and should at last be able to look at both only through the prostituted means and materials which

during a whole lifetime have been the daily instruments of deceit?

What I would inculcate is not far to seek: he who buys a picture should never speculate beyond his judgment; and if he would encourage living art, should do so in the studio of the artist.

THINGS TALKED OF IN LONDON.

July 1851.

THE Census has been a prominent subject of talk from the time that the Registrar-General made the facts public. They have been examined, commented on, and discussed in various ways by the Statistical Society and others; and many and important are the consequent deductions. Looking at the rapid increase and spread of the Anglo-Saxon race on both sides of the Atlantic and in the southern hemisphere, we are told that this race and the English language are to become predominant among the nations and tongues of the earth. Notwithstanding the going forth of emigrants by hundreds of thousands from our shores during the past ten years, the population of Britain has increased 2,263,550 since 1841. In London at the last census the numbers were 1,948,369: now they amount to 2,363,141; and who shall assign a limit to the further multiplication? While it lasts, the great metropolis becomes year by year a more remarkable and interesting phenomenon—a mightier subject of study for the reflective mind. One fact as to the country at large has already given rise to a little serious inquiry: the returns shew that there are half a million more females than males; and social philosophers are beginning to wonder what is to become of them.

The Census, however, as well as most other topics, is thrown into the shade by the Exhibition, which still continues to be the subject of gossip. The objects on show, the throngs of visitors, the daily-enlarging experiences as to the practicability and philosophy of great gatherings, form infinite themes of discussion and remark. According to some, certain beneficial moral effects are beginning to be apparent. Meantime our learned societies have pursued the even tenor of their way without any more striking change than that of an occasional sprinkling of moustached foreigners at their meetings. The Royal Society have held their election meeting, and admitted fifteen out of nearly forty candidates to the honour of fellowship, and they, in common with other distinguished confraternities, have brought their session to a close. Their president, Lord Rosse, has given the last of his four *soirées*; and weary officials are full of self-gratulation at the prospect of a breathing time. And truly there are many who need it; for the whirl and excitement of parties, conversations, &c. are so continuous and overwhelming, that it is only by going to two or three in the course of an evening that some people manage to render the courtesies expected of them, and to conciliate their friends and acquaintances. What should we do were it not for the beauty and quiet of the country?

Happily the turmoil is not universal, as you may judge by the steady way in which scientific research and philosophical investigation are maintained. For example: Let ocean steam-navigators take courage, for it is now an ascertained fact that, in addition to the deposits in several islands of the Indian Archipelago, coal exists in abundance in the Korean peninsula of China. Surprise has at times been expressed that coal should be found in the torrid zone: if a final cause of a very special nature were necessary in the case, it might be found in the maintenance and multiplication of steamers on the great oceans. Another fact from the East is one to which, as the readers of 'Cosmos' will remember, Humboldt attaches some importance—the line of perpetual snow on the Himalayas. It appears from recent explorations by Lieutenant Strachey, that

on the southern edge this line is at an elevation of 15,000 feet, and at 18,500 on the northern; while on the mountains to the north of the Sutlej it rises to 19,000 feet. Thus an inquiry of some interest in physical geography may be considered as settled, subject of course to revision by future explorers.

Lieutenant Gilliss, who, as I told you some time ago, is at the head of an astronomical expedition sent out by the United States to South America, has written an account of the late earthquake at Valparaiso. He says that, 'for several days before and after, there were extraordinary fluctuations of the barometer, and overcast weather. Finding the instrument made for measuring the intensity of shocks fail in its indications, he constructed a pendulum more than nine feet long, supported on a triangle, with a needle inserted in the lower part of the bob, which,' to quote his description, 'just touches a sheet of glazed paper marked with concentric circles and the points of the compass. The paper lies on a horizontal plate of glass resting on the earth, and is sprinkled with black sand, so that the motion of the pendulum leaves a white line exposed. It is to be regretted that the paper had not been secured to the earth, for during the shock there was a displacement bodily of about half an inch; but we have a distinct ellipse, whose diameters are 3.5 inches and 2.4 inches, and positive evidence that the motion of the disturbing force was in a line varying little from north by east to south by west, or contrary to the supposed direction in which the earth-wave has moved in all preceding great disturbances.' These facts are the more interesting at the present time, as the subject of an earthquake-ometer has been more than once discussed at the late meetings of the British Association.

To pass from South to North America, there is the usual assortment of 'notions' from the United States, among which not the least curious is the fact that not fewer than twenty-one applications for patents for churns were made in the course of last year. Most of these utensils were what is called 'atmospheric churns,' which means that they were contrived so that in the process of churning air was interfused with the cream, by which a more complete agitation was effected, and the butter more quickly produced than by the ordinary way. A common churn, it is said, may be converted into an atmospheric, by piercing a hole from one extremity of the dasher to the other, and placing a valve at the bottom to open downwards only. If the dasher be raised quickly, air and not cream rushes into the opening, and on the descent is pressed out laterally, and escapes through the whole mass of the cream, which appears as though it were boiling violently. On some occasions, when the question as to performance and principle between any two churns became delicate, the inventors were required to make butter in the Patent Office at Washington; and once there was held a 'churn race' between a patented and a new churn, in which they both came out alike, making butter from new milk in two-and-a-half minutes.' But as the commissioner appointed to decide on the merits of the case reports: 'Such a rapid separation of the butter is by no means desirable, although this is the general aim of these improvements. We have it upon the highest chemical authority, that butter made so rapidly is not likely to be as good as that which is made slowly.' Thus it would appear that there is a limit to the time of butter-making, not to be overpassed without prejudice to the article—a fact worthy of consideration by those who hold quick production to be the best.

In certain quarters, chiefly among those who are food-providers, M. Masson's experiments are exciting attention. He is gardener-in-chief to the Horticultural Society of France, and has announced a method for preserving alimentary vegetable substances, the result of ten years' study, in which the bulk of the

vegetable is reduced without altering its constitution. The process is one of desiccation in stoves at a low temperature, followed by powerful compression in a hydraulic press. The first operation, as the author describes, deprives the substances of their superabundant moisture, which, in cabbages and certain roots, amounts to 80 or 85 per cent. of the whole bulk. By the second their volume is much reduced, and the density increased until it resembles that of pine-wood, thereby facilitating preservation, packing, and transport.

When required for use, the substance has only to be soaked in tepid water for thirty or forty minutes, and cooked and seasoned in the usual way. Vegetables so preserved have been tried in the French navy; a case of cabbage taken on board the corvette *Astrolabe* in January 1847 was opened in January 1851, and on being dressed was found to be 'of excellent flavour.' All the cakes were in good condition; some of them absorbed six and a half times their weight of water.

M. Masson states that his process admits of application to all green vegetables, as well as to roots, tubers, and fruits. If emigration is to go on as of late, compressed vegetables would supply a most essential aliment to thousands who have now to undergo severe privations and the risk of disease whether on land or water. With these, and the 'meat biscuit' recently introduced from America, and the bread made at Toulouse by certain ingenious bakers from the gluten hitherto wasted in starch factories, one might bid defiance to famine.

Messrs Gratiolet and Cloez have submitted to the Académie a 'Note on the venomous properties of the lactescent humour secreted in the cutaneous pustules of the terrestrial salamander and common toad,' in which it is shewn that the popular belief regarding the nature of the animals in question is not without foundation. They first observed that several frogs which had been shut up with salamanders (efts) in a barrel, were found dead at the end of a week; and having collected a pure white liquid from the pustules of the salamanders, a small quantity was inserted under the leg or wing of a bird. No immediate inconvenience was perceived, but after a few minutes the creatures operated on were seen to stagger, to open and shut the beak convulsively, to erect their feathers, utter plaintive cries, and die in extreme agony. A yellow-hammer thus treated died in three minutes, a turtle-dove in twenty minutes, a chaffinch in twenty-five; most of the birds, however, died in six or seven minutes. Strangely enough, the poison does not appear to be fatal to quadrupeds: even mice escape; but all undergo great suffering.

The poison of the toad (*Rana bufo*) is yellowish, and insupportably bitter in taste. It killed greenfinches and chaffinches in from five to six minutes after inoculation; thus shewing the two poisons to be equally energetic in their action on birds, with this difference, that convulsions are produced by that of the salamander but not by that of the toad. The two authors are pursuing the inquiry into this interesting subject; when they publish anything further worth recording, I shall not fail to acquaint you with it.

Three other savans have been making 'Experimental researches on the modifications produced in the animal temperature by the introduction of different therapeutic agents into the animal economy.' Sulphate of copper, according to their testimony, has a constant lowering effect, which remains for ten or twelve hours. Tartar-emetic, whether in the stomach or the blood, elevates the temperature when taken in minute doses, while larger doses depress. With ipecacuanha the effect is precisely reversed: it is the largest dose which most raises the temperature. Two drops of croton oil first lower, then elevate. Twelve drops produce a reduction of five degrees of temperature in the course of two hours. These are but a few

selected from numerous experiments which are still carried on, as having an important bearing on medical practice—sufficient, however, to give you an idea of their nature. I must just add, before quitting this part of the subject, that M. Carnot states that vaccination only serves to *displace*, not to *diminish* mortality. He believes that the practice of inoculation, and the varioloid eruption consequent thereupon, prevented those gastro-intestinal diseases which are now so frequent and fatal to persons from twenty to thirty years of age. Let the doctors look to it.

M. Babinet has been investigating mathematically the 'Relation of temperature to the development of plants.' It is a question that has been discussed over and over again, and is still debatable. The postulate is, that 'every plant starting from a certain temperature requires the same amount of heat for its equal development.' Thus the point to be first determined was this starting temperature, which of course varies with different plants, and then to estimate the amount of heat necessary to advance the plant from germination to florescence and fructification. It is known that 150 days at a temperature of 60 degrees will effect as much as 100 days at 70 degrees. M. Babinet shews, in a way only to be understood by mathematicians, that the point of departure may be determined by mathematical formulæ, and considers that a much greater increment of heat is necessary for the full development than has been thought of by others who have studied the same subject. While they decide that two or even one degree is sufficient, he holds that six are necessary. In these days of land reclamation and agricultural enterprise such a question becomes important. Its decision will indicate how far north a farmer may plant and sow with hope of success.

Apròpos of cultivation, we are promised a plan, by a Frenchman, for destroying insects hurtful to grain; and M. Guérin-Méneville, whose name I have frequently introduced to your notice, has published certain practical observations on the silk-worm in health and disease, and the best means to improve the breed: he also proposes a method to prevent the boring-worm, by which olive-trees are infested, from pursuing its depredations. Further, and apròpos of botany, Professor Blüme of Leyden has just presented to the Académie his valuable work, in several volumes, on the Dutch plants of the Eastern Archipelago. Among others he treats of the different kinds of upas—a tree of which we used to read with horror in our schoolboy days. They are all more or less poisonous in their juices; but, as M. Blüme shews, the stories about the noxious vapours destroying the birds that fly over them are mere inventions, for birds build their nests and rear their young as comfortably in the branches of the upas as in any other tree. He adds that the volcanic soil of Java in certain places emits a deleterious gas, the effects of which have been mistakenly attributed to the trees.

Photography is being pursued with such vigour as to shew that ere long it will compete powerfully with the arts of engraving and printing. M. Bayard is working at the problem, 'To render the positive paper highly impressionable under the action of a light relatively very feeble.' By his process he gets copies of the positive impression in one second by the sun, and in less than an hour by a carcel lamp. And according to M. Blanquart Evrard of Lille, copies of the negative impression may be taken at the rate of 200 or 300 per day, and sold for one penny or twopence. If he can really do what he says, how perfect and exact we may hope to have the illustrations of books!

To turn to another topic, M. Pierre Landry applies hygienic laws to the construction of towns and cities, and submits a plan to the Académie which is to satisfy all the needs of health, &c. Taking a town situate on

a public highway, he describes: '1. The main-road which commonly traverses the town is contrived so as to form the three principal streets which comprise the town within them; 2. The public edifices necessary to the whole town are grouped at the centre, and thus realise a spacious reservoir of air and sunshine; 3. The streets composing the town are planned around the public edifices, avoiding exposure to the north; 4. At the angles of the town are private country residences, and beyond them agricultural buildings; 5. At one end are the hospitals, barracks, museum of natural history,' &c.

By this plan, as the inventor sums up, 'every one has the sun, pure air, a picturesque prospect, and the maximum of hygienic conditions; and the causes of disease arising out of vicious construction may be made to disappear from towns.' It must be remembered that M. Landry writes for French readers. The question which he opens is one that has excited some attention in France; in proof of which I may mention the translation of Mr Roberts's work on the Dwellings of the Labouring Classes under the auspices of the President.

I have much more to say, but can only make room for a remarkable fact: M. Charault finds, on electrifying a liquid in which an aerometer is placed, that the instrument immediately rises, indicating a lesser density of the fluid. On de-electrifying, it sinks to its former level. The same effect can neither be produced by the current from a galvanic battery nor by the discharge from a Leyden jar.

STORY OF A DRAMATIST.

One cold morning in February 1810, a short, stout, commonplace-looking man, about sixty years old, entered the garden of an inn situated in the suburbs of Paris. Although the air was sharp and frosty, he seated himself near one of the tables placed out of doors, and taking off his hat, passed his fingers through his long gray hairs.

His hands contrasted strangely with the remainder of his person: they were small, white, and terminated in such delicately-formed pink nails as might excite the envy of many a young lady. Presently one of the waiters came up, and placed before him a bottle of wine.

'Not any to-day, thank you,' said the old man. 'I feel fatigued, and will just rest for a moment.'

'The best way of resting, monsieur,' replied the waiter gaily, 'is to drink a good glass of wine.'

He drew the cork, and poured out some of the wine.

The old man rose and walked away. The waiter was a young lad, and it was with a confused and embarrassed air that he ran after the guest and said: 'Sir, there is credit for you at the Lion d'Or; if you have forgotten your purse, that's no reason you should lose your breakfast. To-morrow, or whenever you like, you can ask for the bill.'

The old man turned, looked at the youth, and a tear sparkled in his eye. 'Thou art right, Jean,' he said; 'poverty must not be proud. I accept thy kindness as frankly as it is offered. Help thyself to a glass of wine.'

'I drink to your very good health, monsieur,' said the waiter; and having emptied his glass, he went and fetched some spiced meat, bread, cheese, fruit, and everything necessary for a tempting and nourishing repast; then with native politeness, in order to lessen the painful sense of obligation to his guest, he said: 'When next one of your pieces is played, will you give me a ticket?'

'Thou shalt have two this very evening, my good

lad. I will go and get them from Brunet, and bring them back to thee.'

'The walk would be too much for your strength, monsieur: some other day, when you happen to pass by, will do as well.'

'Thou shalt have a ticket to-day, for they are going to perform one of my pieces, "*Le Désespoir de Jocrisse*," at the *Théâtre des Variétés*; and it may amuse thee.'

'Ah, thank you, monsieur! What laughing I shall have!'

'Yes; the poor old man, who but for thy charity would not have had a morsel to eat to-day, will this evening entertain a numerous assembly. They will applaud his pleasantry, they will laugh at his wit, but none of them will inquire about his destiny.'

'But, monsieur, do not your pieces bring you money?'

'Not now, my friend. In order to support life during the past month I was obliged to forestall the resources of the present one. These are only the slender returns from my former productions, for now age and misfortune have robbed my mind of its former powers. I no longer offer any vaudevilles to the managers; for although they accept them, and pay me, they never have them played. I perceive they only take them from motives of compassion, and as a pretext for giving me alms. Now, my friend, thou art the first from whom I have accepted charity, and thou shalt be the last. The son of Louis Quinze may have descended to write in the character of a buffoon, and as it were to set his wit dancing on the tight-rope of a vaudeville, but he will not become a beggar were he expiring of hunger. You look as if you thought I have lost my senses; but it is not so. Louis Dorvigny is the son of a king. My mother, the young orphan daughter of the Count d'Archambaud, died in giving me birth. My father was Louis Quinze. During my childhood and youth an invisible protector watched over me, and provided amply for my support and education. Suddenly the fostering hand was withdrawn, and I was cast on the world to work unaided for my support. I did so until the moment when the powers of both mind and body failed me. That is my history—a royal origin, success, reputation, almost glory; and its end—a meal owed to thy charity! Adieu, young man, and thanks; I will bring thee the ticket for the play.' So the old man departed, but as he stepped into the road he found himself intercepted by two or three cavalry regiments returning to their barracks after a review.

The band was playing a lively air, and in the midst of the troops rode in the place of honour a general dressed in a magnificent uniform, and mounted on a splendid Andalusian charger. Happening as he passed to cast a glance at Dorvigny, he uttered a loud exclamation of surprise. Without heeding his soldiers he stopped, jumped off his horse, and taking the old man by the hand, saluted him with great affection. Dorvigny stared with astonishment, not recognising his features.

'You do not know me! Have twenty years caused Monsieur Dorvigny to forget his idle, good-for-nothing servant-boy?'

'Jean Dubois!'

'Yes, Jean Dubois—Jocrisse, as you used to call him. You ought not to have forgotten me, for I served as the model of one of your happiest dramatic creations.'

'What! my poor boy—monsieur, I mean—thou art—you are become a general?'

'Precisely. While in your service I was a terrible destroyer of plates: now in the Emperor's, I perform the same office for his enemies. How glad I am to have met you! During the two days since my arrival in Paris I have sent to seek for you in every direction, but I could not discover your address.'

'Because I have no longer an address.'

'Then you must come and take up your abode at mine.'

'General!'

'A general is accustomed to be punctually obeyed. I arrest you as my prisoner. Go,' he continued, addressing a soldier, 'fetch me a carriage, and lead my horse home. Now, Monsieur Dorvigny, step in.'

Half-laughing, half-resisting, the old man took his place in the carriage next the general. 'Do you remember,' said the latter as they drove on, 'the day that I left your service, because, as you told me, you were no longer rich enough to keep a servant? I tried my fortune in several situations, but did not find any master so lenient towards my faults as you; so as a last resource I enlisted in a regiment. I was jeered by my comrades for my awkwardness, and for many months led an unhappy life; until one day we found ourselves at Bornio in the Valteline, facing a redoubt which opened a murderous fire on our ranks. The order was given to advance, and we rushed to the attack; but presently most of our men were mowed down, and those who escaped hesitated and drew back. I threw myself alone into the redoubt, shouting: "Follow me, boys!" They did so. The Austrians, astonished at this unlooked-for attack, fled, and we took twelve pieces of cannon. The same day I was made a sergeant; and afterwards, by degrees and the fortunes of war, rose to the rank I now occupy. Perhaps I may get still higher!'

Dorvigny was installed by the general in a pleasant apartment next his own, and for some time the old man enjoyed all the comforts and luxuries of life. At length his friend received an order to set out for Russia. During the first three months of the campaign General Dubois sent letters and remittances to his former master, but they suddenly ceased, and one morning, from the column of a newspaper, Dorvigny learned that his friend had fallen at Moscow.

He was forced to leave his pleasant lodging, and take refuge in an attic in an obscure part of Paris. There, after having sold the coat off his back, overwhelmed with age and illness, he went to the proprietor of the Théâtre des Variétés, whose fortune he had made, and begged for a small weekly pittance. It was refused. The old man smiled bitterly when the sentence was pronounced, and from that time he shunned meeting his acquaintance. The bookseller, Barba, who felt some friendship for him, sought him in various parts of the city, but in vain. A short time afterwards Barba happened to hear that in a mean lodging, in the Rue Grenétat, was lying, unclaimed and unknown, the corpse of an old man. With a sad presentiment he hastened thither. It was indeed Dorvigny—dead from cold and hunger, uncared for alike in life and death!

The son of a peasant, the awkward servant-boy, became a general, and after a glorious career died the death of a hero: the son of a king, the charming poet, the bewitching dramatist, lived in poverty, and died the death of an outcast! Such is life!*

SHAKESPEARE AND THE MOUNTBANK.

When I was a boy I went once to a theatre. The tragedy of Hamlet was performed—a play full of the noblest thoughts, the subtlest morality that exists upon the stage. The audience listened with attention, with admiration, with applause. But now an Italian mountebank appeared upon the stage—a man of extraordinary personal strength and sleight of hand. He performed a variety of juggling tricks, and distorted his body into a thousand surprising and unnatural postures. The audience were transported beyond themselves; if they had felt delight in Hamlet, they glowed with rapture at the mountebank. They had listened with attention to the

lofty thought, but they were snatched from themselves by the marvel of the strange posture. Enough, said I; where is the glory of ruling men's minds and commanding their admiration when a greater enthusiasm is excited by mere bodily agility than was kindled by the most wonderful emanations of a genius little less than divine!—*Eugene Aram.*

THREE SONNETS.

'Till with the dawn those angel faces smile,
That I have lov'd long since, and lost awhile.'

I WILL not paint them. God them sees, and I:
None other can, nor need. They have no form;
I cannot close with passionate kisses warm
Their eyes that shine from far or from on high,
But never will shine nearer till I die.
How long, how long! See, I am growing old,
Have ceas'd to count within my hair's close fold
The silver threads that there in ambush lie;
Some angel faces, bent from heaven, would pine
To trace the scarred lines written upon mine.
What matter! In the furrows plough'd by care,
Let age tread after, sowing immortal seeds!
All this world's harvest yields, wheat, tares, and weeds,
Is reap'd; 'neath God's stern sky my field lies bare.

But in the night-time, 'tween me and the stars
The angel faces still come floating by,
No death-pale shadow, no averted eye
Marking the inevitable doom that bars
Me from them. Not a cloud their aspect mars;
And my sick spirit walks with them hand in hand
By the cool waters of a pleasant land;
Sings with them o'er again, without its jaze,
The psalm of life that ceas'd when one by one
Their voices sank, and left my voice alone,
With dull monotonous wail, to grieve the air;
Turns glad from thee to the other, still to find
Its own—'I love thee!' echoed close and kind;
—Moon glimmering, bridging the black sea, Despair!

Ay, angel faces! So I ever deemed
Their human likeness; so I see them now!
God laid his visible signet on each brow,
And they were holy, even as they seem'd.
Then, though all earth and hell itself had schem'd
To lure them from me by divided road,
One goal remains for all—the throne of God;
And I shall find them there! Not vain I dream'd,
My sainted ones! my glorious ones! my lov'd
And lost ones! from my famish'd sight remov'd
A little while, lest I might worship ye,
And forget heaven. Sure as at God's White Throne
All whom He loves one living union own,
My angel faces there will shine on me.

THE EMIGRANT'S MANUAL.

A complete MANUAL for EMIGRANTS, embracing the latest and most trustworthy information, is now published by W. and R. CHAMBERS. It is issued in Parts, each referring to a distinct FIELD OF EMIGRATION.

AUSTRALIA. 1s.—NEW ZEALAND, CAPE of GOOD HOPE, &c. 1s.—BRITISH AMERICA, and UNITED STATES of AMERICA. 1s.—EMIGRATION in its PRACTICAL APPLICATION to INDIVIDUALS and COMMUNITIES. Price 1s.

Price 3s. cloth boards.

SECOND GERMAN READING BOOK. With Notes in English. By CARL EDUARD AUE, Ph. D., German Master in the High School of Edinburgh.—Forming one of the Volumes of the GERMAN SECTION of CHAMBERS'S EDUCATIONAL COURSE.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 35 West Nile Street, Glasgow; and J. McGLASHAN, 59 Upper Sackville Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

* The above is abridged from the French of T. H. Berthoud.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 396. NEW SERIES.

SATURDAY, AUGUST 2, 1851.

PRICE 1½d.

LOVING ONE FOR ONE'S SELF.

THERE is a story of certain men of Gotham, who, sitting down upon the ground in a circle to converse, had some difficulty when they were about to separate in finding their own peculiar limbs. Each man insisted upon appropriating to himself the best-turned leg near him, just as one naturally does in the matter of hats at the breaking-up of an evening-party; and the *embrouillement* might have terminated in something serious had not the disputants been members of the Peace Society, and referred the question to the arbitration of a passer-by. This individual fortunately possessed at once a philosophic mind and a vigorous arm, and he applied a horsewhip so sharply to the backs of the whole circle that every man found his own legs in the twinkling of an eye.

Some persons may be disposed to doubt, in a certain measure, the authenticity of this anecdote, or even to rank our men of Gotham summarily with the personages of mythic story: but a little reflection will shew that we are all subject to mistakes and misconceptions quite as extraordinary, and of a much more wholesale nature. What is more common than for a man to lose himself in the mazes of a story, till his identity merges in that of the hero, and he is the vision by which he is haunted, till

— 'All his visage wanes,
Tears in his eyes, distraction in his aspect,
A broken voice, and his whole function suiting
With forms to his conceit'—

when suddenly the horsewhip of Circumstance flashes over his shoulders—a door claps, a bell rings, a voice calls—and hey! presto! the illusion vanishes, and Richard's himself again!

Himself? What self? This is a puzzling word when you think of it. It is a tradition, a convention, supposed by common consent to have a meaning; which, nevertheless, waxes dimmer and more formless the more earnestly you look for it. To be loved for one's self is the grand aspiration both of romance and real life. Love of any other kind is voted a lie and a cheat, and not only so by sentimental young ladies but by the grave, staid, and even elderly of the male sex. 'It is I who must be loved,' say all with one voice, 'and not my birth, fortune, station, power—not the mere material circumstances by which I am surrounded by the accidents of the world.' 'It is I who must be loved,' says Miss Angelina, going into particulars, 'and not my beauty, shape, manner, dress, dancing, dowry, jewels: I must be loved for myself, and for myself alone; for an individuality which cannot be affected by misfortune, poverty, or even smallpox.'

Now this is what puzzles us. *What is this self?*—*what is this individuality?* It is a physiological fact that the whole of our frame, the whole of our material part, is perpetually changing; that there is not an atom of our body which was in existence, as one of its component parts, a few years ago; and that the materials of which some brief time hence we shall be composed are at present diffused throughout the different kingdoms of nature. It is obviously, therefore, not the physical bulk of Miss Angelina she calls her Self; and one does not see clearly how she can be said to have any more absolute and exclusive property in her moral and intellectual character apart from the circumstances by which it was developed.

If our fair enthusiast had chanced to be born in a cellar, and brought up in misery and crime, she would, according to her theory, have still been the same self. Will she tell us that she would still be entitled to expect the same love? If not, she cannot be loved for herself, but for the material circumstances which are part and parcel of her individuality. If she had grown up in some remote and solitary place, with a deaf-mute for her sole companion, she would still have been the same entity, and she would still have possessed, in the recesses of her moral being, the germs of those qualities which in a state of development and activity are fitted to awaken admiration. But without knowledge, without aspirations beyond those of mere animal life, and without even language to express her few ideas, would she be entitled to the love she now demands as a right?

It may be answered—for a man's self will not be quietly surrendered any more than his skin—that at the time love is won the moral and intellectual being is formed, the innate qualities developed, and that individuality constituted which is the self all seek to vindicate. But this is affixing an arbitrary and impossible limit to the progress of mind. It assumes that circumstances influence us up to a certain precise point, and that then their effect ceases suddenly, and the character, till that moment in a liquid and ductile state, cools down at once in its mould, and becomes a solid and unchangeable mass. It is unreasonable thus to have recourse to miracle even for the protection of one's self. The world in which we live is the school of circumstances, and we are usually taken home before we are half taught. It is common to say of some unexpected conduct in a man: 'We did not think him capable of it: this presents him in quite a new light—he is a different person from what we supposed him to be.' He is indeed a different self. The circumstances in which he chanced to be placed have brought out some hitherto dormant points in his character, and the man is to all intents and purposes a new being. These

circumstances are essential to the estimate we form of him, whether good or bad, whether tending to love or hate.

But the passion for being loved for one's self has led, we are told, to experiment, and this has resulted in facts that laugh at our philosophy. A gentleman who has a high opinion of the entity he calls himself, determines to ascertain in what estimation it is held by others. He takes measures, therefore, which appear to strip him of all the prestiges of wealth and rank. He becomes a bankrupt, loses his estate, lays down his carriage, exchanges his mansion for a cottage; and in this denuded condition presents himself to his lady-love. Her woman's heart, however, is as firm as a rock. She has loved him in wealth, and still loves him in poverty. The atmosphere in which they lived has changed its temperature; but she only nestles the closer to her chosen one. The material conductors between them are broken; but passion, with a finer sense than the electric fluid, overleaps the chasm. Surely this is being loved for one's self! Not at all. The gentleman only acts ruin, he does not feel it; his manner, his speech, his aspect, are the same, only touched by a melancholy which gives romance to his misfortune. The lady only hears of poverty, she does not see it; and her imagination is busy embrowning her lover's cheek with manly toil, and festooning their cottage-porch with roses and jasmine.

Real poverty is a very different thing from stage poverty. Real labourers neither work nor play in knee-breeches trimmed with ribbons, and clean white stockings; cottage girls don't go a haymaking in muslin dresses, or dust the table with snowy aprons; real gentlemen don't take kindly to their porridge or their fat bacon; neither are they partial to the crystal spring; and no more do they learn intuitively to plough and reap, but on the contrary are jeered for their ignorance and effeminacy by the cow-boys, and are a standing butt for the oxen. Our ruined gentleman would cut a very awkward, and perhaps a very unamiable figure in any other position than the one he had been accustomed to—as his faithful mistress would find if she could follow him into his new avocations. In the meantime she makes the mistake, in meditating on his changed fortune, of supposing him to be the same self by whom her heart was won; and thus her fancy carries him in a stage costume through the stern realities of the working world.

Do we say, then, that there is no such thing as disinterested love? No, ladies! no, gentlemen! we say nothing of the kind. What we say is, that the character of a man has no separate existence, so far as the perceptions of others are concerned, from the circumstances by which it has been formed, and in which it is embedded. The notion of being loved, therefore, for one's self, is mere fudge; and the witty sneers of young ladies or young gentlemen at the appliances of fortune which surround the object of their choice is mere babble. We cannot tell what a man will do if thrown out of his position; we do not know how his accomplishments will wear in another sphere of life, or what hitherto dormant qualities may rise into activity. We know and love what he is; but we neither know nor love—except in a dream and delusion—what he will be. Suppose the instance we have given to be reversed in point of station—suppose some cottage Blowsalinda sees her Strephon metamorphosed, all on a sudden, into a gentleman by some magical stroke of fortune: her affections are unchanged, for they are rivetted on *himself*; not on his clouded shoon; and her innocent imagination even pleases itself with pictures of his long coat and gloved hands. But if she could see his entrance into the new life to which he is called—his awkwardness, his ignorance, his bashfulness; if she could hear the gibes of the very servants on his manner and appearance; and, above all, if she could feel the

change his new fortune has wrought in him, and the terror with which he starts at every apparition before his fancy of his peasant mistress—she would know that the hero of her love was no more than a shadow or a memory.

But, again, do we say that there is no such thing as disinterested love? By no means. We merely say that there is no such thing as love fixed upon a mere abstraction—upon a thing irrespective of circumstance and change. The grief that is felt at a love-disappointment is like the tears that are given to the dead—tears that enliven the living image in our memory—not the ruin that moulders in the grave. Disinterested love is found in every station, in every circle of circumstances; and in married life, more especially, where it has freer scope, it enlivens the dreariest path of adversity, and indeed festoons the humblest porch with roses and jasmine. Disinterested love is not the love of the occult self we have been groping after, but of an actual being possessed of qualities that have our sympathy and admiration, and surrounded by circumstances calculated to retain them in activity. For this being we would make any sacrifice—in great emergencies, that of life itself: but we will not stultify ourselves by affirming that we love him as an abstraction. In the above instances we have seen that generous love remains even after its object has been stripped of everything by which it was won. But this, philosophically considered, is the love of one who exists merely in our memory, and with whom the actual man identifies himself only in those comparatively rare cases where great, or good, or merely pleasing qualities are so firmly embedded in the character as to survive the shock of change.

TALES OF THE COAST-GUARD.

ALLY SOMERS.

WHEN I joined the *Scorpion* sloop of war, then (1810) on the West India station, there were a father and son amongst the crew whose names, as borne on the ship's books, were John Somers and John *Alice* Somers. The oddity in this country of giving a boy a female baptismal name had been no doubt jestingly remarked upon by those who were aware of it, but with the sailors the lad passed as *Ally* Somers. The father was approaching fifty, the son could not have been more than seventeen years of age. The elder Somers, who had attained to the rating of a boatswain, was a stern, hard, silent man, with a look as cold and clear as polished steel, and a cast-iron mouth, indicative of inflexible, indomitable firmness of will and resolution. The son, on the contrary, though somewhat resembling his father in outline of feature, had a mild, attractive, almost feminine aspect, and a slight graceful frame. I was not long in discovering that, obdurate and self-engrossed as the man appeared, the boy was really the idol-image in which his affections and his hopes were centred. His eye constantly followed the motions of the lad, and it appeared to be his unceasing aim and study to lighten the duties he had to perform, and to shield him from the rough usage to which youngsters in his position were generally subjected by the motley crews of those days. One day a strong instance in proof of this master-feeling occurred. *Ally* Somers some time previously, when on shore with a party despatched to obtain a supply of water, had, during the temporary absence of the officer in command, been rather severely rope-ended by one of the seamen for some trifling misconduct, and a few slight marks were left on the lad's back. The rage of the father, when informed of the circumstance, was extreme, and it was with difficulty that he was restrained from inflicting instant chastisement on the offender. An opportunity for partially wreaking his boarded vengeance occurred

about six weeks afterwards, and it was eagerly embraced. The sailor who had ill-used young Somers was sentenced to receive two dozen lashes for drunkenness and insubordination. He was ordered to strip, placed at the gratings, and the punishment began. Somers the boatswain, iron or sour-tempered as he might be, was by no means harsh or cruel in his office, and his assistants, upon whom the revolting office of flogging usually devolved, influenced by him, were about the gentlest-handed boatswain's-mates I ever saw practise. On this occasion he was in another and very different mood. Two blows only had been struck when Somers, with an angry rebuke to the mate for not doing his duty, snatched the cat from his hand, and himself lashed the culprit with a ferocity so terribly effective, that Captain Boyle, a merciful and just officer, instantly remitted half the number of lashes, and the man was rescued from the unsparing hands of the vindictive boatswain.

Other instances of the intensity of affection glowing within the stern man's breast for his comparatively weak and delicate boy manifested themselves. Once in action, when the lad, during a tumultuous and murderous struggle, in beating off a determined attempt to carry the sloop by boarding, chanced to stumble on the slippery deck, he was overtaken before he could recover himself, and involved in the fierce assault which at the forecabin was momentarily successful. I was myself hotly engaged in another part of the fight; but attention being suddenly called to the forepart of the ship by the enemy's triumphant shouts, I glanced round just in time to see the boatswain leap, with the yell and bound of a tiger, into the mêlée, and strike right and left with such tremendous ferocity and power as instantly to check the advancing rush. Our men promptly rallied, and the deck was in a few minutes cleared of every living foe that had recently profaned it. Ally Somers, who had received a rather severe flesh wound, and fainted from loss of blood, was instantly caught up by his father, and carried with headlong impatience below. When the surgeon, after a brief look at the hurt, said: 'There is no harm done, Somers,' the high-strung nerves of the boatswain gave way, and he fell back upon a locker temporarily prostrate and insensible from sudden revulsion of feeling. Several times I was an unintentional auditor of scraps of conversation between the two whilst the lad was on the sick-list, from which I gathered that Ally was the sole issue of a marriage which had left bitter memories in the mind of the father; but whether arising from the early death of his wife, or other causes, I did not ascertain. Somers was, it appeared, a native of the west of England, and it was quite evident had received a much better education than usually falls to individuals of his class.

At the close of the war Somers and his son were, with thousands of others, turned adrift from the royal service. Some months after my appointment to the command of the revenue-cutter, I chanced to meet the father in the village of Talton, about four miles out of Southampton, on the New Forest Road. He had I found re-entered the navy, but chancing to receive a hurt by the falling of a heavy block on his right knee, had been invalided with a small pension, upon which he was now living at about a hundred yards from the spot where we had accidentally met. Ally, he informed me, was the skipper of a small craft trading between Guernsey and Southampton. There was little change in the appearance of the man except that the crippled condition of his leg appeared to have had an effect the reverse of softening upon his stern and rugged aspect and temper. When paid off he was, I knew, entitled to a considerable sum in prize-money, the greater part of which he told me he had recently received.

About a couple of months after this meeting with the father I fell in with the son. I was strolling at about

eleven in the forenoon along the front of the Southampton customhouse, when my eye fell upon a young man, in a seaman's dress, busily engaged with three others in loading a cart with bundles of laths which had been landed shortly before from a small vessel alongside the quay. It was Ally Somers sure enough; and so much improved in looks since I last saw him, that but for a certain air of fragility—inherited probably from his mother—he might have been pronounced a handsome fine young fellow. The laths, upwards of two hundred bundles, which he was so busily assisting to cart, he had brought from Guernsey, and were a very common importation from that island: Guernsey possessing the right of sending its own produce customs free to England, a slight duty, only tantamount to what the foreign timber of which the laths were made would have been liable to, was levied upon them, and this was ascertained by the proper officer simply measuring the length and girth of the bundles. This had been done, and the laths marked as 'passed.' It struck me that the manner of Ally Somers was greatly flurried and excited, and when he saw me approaching, evidently with an intention to accost him, this agitation perceptibly increased. He turned deadly pale, and absolutely trembled with ill-concealed apprehension. He was somewhat reassured by my frank salutation; and after a few commonplace inquiries I walked away, evidently to his great relief, and he with his sailors continued their eager work of loading the cart. I could not help suspecting that something was wrong, though I could not make up my mind to verify the surmise his perturbed and hurried manner excited. Once in a skirmish on shore his father, the boatswain, had saved my life by sending a timely bullet through the head of a huge negro who held me for the moment at his mercy. Besides I might be wrong after all, and I had no right to presume that the officer who had passed the laths had not made a sufficient examination of them. The flurry of the young man might arise from physical weakness and the severe labour he was performing in such hot weather. These reasons, or more truly these excuses for doing nothing, were passing through my brain, when I observed the hasty approach of the collector of customs himself towards the cart, followed by several of his subordinates. Young Somers saw him as quickly as I did, and the young man's first impulse, it was quite plain, was flight. A thought no doubt of the hopelessness of such an attempt arrested his steps, and he stood quaking with terror by the side of the cart, his right hand grasping for support at one of the wheel-spokes.

'One of you lend me a knife,' said the collector, addressing the officers of customs.

A knife was quickly opened and handed to him; he severed the strong cords which bound one of the bundles of laths together, and they flew asunder, disclosing a long tin tube of considerable diameter, closely rammed with tobacco! All the other bundles contained a similar deposit; and so large was the quantity of the heavily-taxed weed thus unexpectedly made lawful prize of, that a profit, I was assured, of not less than £500 or £600 would have been made by the audacious smuggler had he succeeded in his bold and ingenious attempt. The ends of the bundles had been filled up with short pieces of lath, so that, except by the process now adopted, it was impossible to detect that the cargo was not *bonâ fide* what it had been declared to be. The penalties to which Somers had rendered himself liable were immense, the vessel also was forfeited, and the unfortunate young man's liberty at the mercy of the crown. He looked the very picture of despair, and I felt assured that ruin, utter and complete, had fallen upon him.

He was led off in custody, and had gone some dozen paces when he stopped shortly, appeared to make some request to the officers by whom he was escorted, and

then turning round, intimated by a supplicatory gesture that he wished to speak to me. I drew near, and at my request the officers fell back out of hearing. He was so utterly prostrated by the calamity by which he had been so suddenly overtaken, that he could not for several moments speak intelligibly. I felt a good deal concerned for so mere a boy, and one too so entirely unfitted by temperament and nerve to carry through such desperate enterprises, or bear up against their failure.

'This is a bad business,' I said; 'but the venture has not, I trust, been made with your own or your father's money?'

'Every penny of it,' he replied in a dry, fainting voice, 'was our own. Father lent me all his prize-money, and we are both miserable beggars.'

'What in the name of madness could induce you to venture your all upon a single throw in so hazardous a game?'

'I will tell you,' he went on hurriedly to say in the same feeble and trembling tone: 'I am not fitted for a sea-life—not strong, not hardy enough. I longed for a quiet, peaceful home ashore. A hope of one offered itself. I made the acquaintance of Richard Sylvester, a miller near Ealing. He is a good man, but griping as far as money is concerned. I formed an attachment for his eldest daughter Maria; and he consented to our union, and to taking me as a partner in his business, if I could pay down five hundred pounds. I was too eager to wait long; besides I thought that perhaps—But it boots not to speak of that now: I set more than life upon this cast; I have lost, and am now bankrupt of resource or hope! Will you break this news to my father, and see?—His remaining firmness gave way as the thought he would have uttered struggled to his lips, and the meek-hearted young man burst into tears, and wept piteously like a girl. A number of persons were collecting round us, and I gently urged him to walk on to the customhouse. A few minutes afterwards I left him there, with a promise to comply with his request without delay.

I found John Somers at home, and had scarcely uttered twenty words when he jumped at once to the true conclusion.

'Out with it, sir!' exclaimed the steel-nerved man. 'But you need not; I see it all. Ally has failed—the tobacco has been seized—and he is in prison.'

Spite of himself his breath came thick and short, and he presently added with a fierce burst, whilst a glance of fire leaped from his eyes: 'He has been betrayed, and I think I know by whom.'

'Your suspicion that he has been informed against is very likely correct, but you will, I think, have some difficulty in ascertaining by whom. The customhouse authorities are careful not to allow the names of their informants to leak through their office-doors.'

'I would find him were he hidden in the centre of the earth!' rejoined the ex-boatswain with another vengeful outcry which startled one like an explosion.

'But,' added the strong and fierce-willed man after a few moments' silence, 'it's useless prating of the matter like a wench. We must part company at once. I thank you, sir, and will tell Ally you have called.' I mentioned the other request made by his son. 'That is a rotten plank to hold by,' he said. 'Ally's chance is over there, and it would be mere waste of time to call on the old man: his resolution is hard and unyielding as his own millstones. Maria Sylvester is gone with the five hundred pounds her father bargained for; and the girl's tears, if she shed any, will soon be dry. I warned Ally of the peril of steering his course in life by the deceptive light of woman's capricious smiles and vanities; but he, poor, flexible, gentle-minded boy, heeded me not. I may not longer delay: he will be anxious to see me. Good-day, sir.'

The consequence which I chiefly feared came to pass,

even more speedily than I had apprehended. It being impossible to liquidate the penalties incurred, Ally Somers was imprisoned as a crown debtor; and at that period, whatever may be the case now, revenue penalties could not be got rid of by insolvent-court schedules. The prospect of an indefinite term of imprisonment, with other causes of grief and depression, broke down the always fragile health of the prisoner, and he died, ere yet his youth was well begun, after about six months' confinement only.

The tidings were brought me by the old man himself. I was seated in the cabin of the *Rose* cutter when it was announced that John Somers was alongside in a boat, and wished to see me. I directed that he should be allowed to come aboard, and presently the old man, with despair visible in every line of his countenance, in every glance of his restless, flaming eyes, entered the cabin.

'I am come to tell you, sir, that Ally is dead.'

'I was somewhat prepared for this bad news, Mr Somers,' I answered. 'It's hard upon you, but it should be bravely borne with.'

He laughed strangely. 'To be sure, to be sure,' he said, 'that is wise counsel—very wise; but that which I want now more than wise counsel is ten pounds—ten pounds, which I shall never be able to repay.'

'Ten pounds!'

'Yes: you may remember that I once saved your life. If that piece of service was worth the sum I have mentioned, you can now discharge the obligation. I have parted with everything, and Ally's last prayer was to be buried beside his—Beside a grave, an early and untimely one, like his own, many miles away.'

'I understand: it is a natural and pious wish, and you shall have the money.'

'Thank you. The funeral over, I have but one more thing to do in life, and that is to assist you in securing Cocquerel whilst running one of his most valuable cargoes.'

'Cocquerel, the Guernseyman you mean?'

'Ay, so he calls himself; but I fancy he at one time hailed from another port. He is the man who sold Ally's secret to the revenue-officers!'

'Are you sure?'

'As death! He was Ally's only confidant, and Ally's father is now in Cocquerel's confidence. It is but natural,' added Somers, and a bitter, deadly sneer curled his ashy lips—'it is but natural, you know, that I should be eager to assist in pillaging a government which caged my son, and held him under its iron bars till life had fled. Cocquerel understands this, and trusts me fully; but that which he does not understand, know, or suspect,' continued the fierce old man, sinking his voice to a whisper, and leaning forward with his face close to mine, 'is that John Somers has found out who it was that sold his boy's life! Did he know that, and know me too, there would be sounder sleepers than he in these dark nights.'

'What do you mean?'

'Nothing more, of course,' he replied in a more checked and guarded tone, 'than to retort the trick he played Ally something after his own fashion.'

'That is a fair revenge enough, and I'll not balk you. Now, then, for your plan.'

Various details were discussed, and it was settled that on that day-week Somers was again to communicate with me. He then took leave.

At the appointed time Somers returned, and appeared to be in high but flighty spirits. Everything was, he said, arranged, and success all but certain. His scheme was then canvassed and finally agreed upon, and he again left the vessel.

The arrangement for the surprise and capture of Cocquerel was this:—That notorious smuggler intended running a large cargo on the coast of Dorsetshire, on the north of Portland, at a place where the cliffs are high, precipitous, and abrupt, and at that time very

inefficiently watched by the shore-force. Near the spot selected is or was a kind of cavern worn by the action of the sea in the chalky stratum, which at neap-tides was partially dry, and at the time of our enterprise would effectually conceal a boat from the observation of any one who did not actually peer in directly at its mouth. Cocquerel was to leave Guernsey the next day in a large boat, with two lug-sails, but chiefly depending for speed upon its sweeps. It was calculated that he would reach his destination about midnight. Somers had undertaken the duty of shore-signalman, and if danger were apprehended, was to warn the smugglers that hawks were abroad by burning a blue-light. The manner of running the cargo was to be this:—Somers was provided with a windlass and sufficient length of rope, with a kind of rope-cradle at the end of it, in which a man could sit, or a couple of kegs be slung, to reach the boat. The windlass he was to secure firmly at the edge of the cliff, and two or three of the men having been drawn up, other windlasses were to be fixed, by means of which it was calculated that in about half an hour the entire cargo would be safely carried off by the carts which Somers had undertaken to have ready on the spot. The signal for our appearance on the scene of action, the positive old man persisted, should be that agreed upon for the warning of the smugglers—the sudden ignition of a blue-light. This did not seem the cleverest possible mode of procedure; but as the cavern in which we were to conceal ourselves was but a few yards northward of the spot marked out for the landing, and Somers promised he would only give the signal when the smugglers were in full work, I had little fear that, if other accidents did not capsize our scheme, they would be able to escape us.

The next afternoon the largest boat belonging to the *Rose* was fully manned; and leaving the cutter quietly at anchor in the Southampton river just above Calshot, we pulled with the tide—for there was but a light air, and that favourable for the smugglers, not for us—to our hiding-place, which we reached about eight o'clock in the evening.

The hours crept very slowly and dismally away, amidst the darkness and hoarse echoes and moanings of the cavern, into which the sea and wind, which were gradually rising, dashed and howled with much and increasing violence. Occasional peeps at my watch, by the light of a lantern carefully shaded seaward, warned us that ten, eleven, twelve, one o'clock had passed, without bringing the friends we so anxiously expected, and fears of ultimate disappointment were chilling us far more than the cold night-breeze, when a man in the bow of the boat said in a whisper that he could hear the dash of oars. We all instantly listened with eager attention; but it was not till we had brought the boat to the entrance of the opening that the man's assertion was verified. There it was clear enough; and the near approach of a large boat, with the regular jerk of the oars or sweeps, was distinctly audible. The loud, clear hail of their shore-signalman, answered by the 'All right' of the smugglers, left no doubt that the expected prey was within our grasp; and I had a mind to pounce upon them at once, but was withheld by a promise which I had been obliged several times to repeat, that I would not under any circumstances do so till the signal-flame sent its light over the waters.

As soon as the noise and bustle of laying in the sweeps, lowering the sails, and unstepping the masts, had subsided, we heard Somers hail the boat, and insist that the captain should come up before any of the others, as there was a difficulty about the carts which he alone could settle. The reply was a growl of assent, and we could hear by the click of the check to the cog-wheel of the windlass that Somers was paying out the rope. Presently Cocquerel was heard to get into the

cradle I have spoken of, to which a line was fastened in order to steady his ascent from below. The order was given to turn away, and the renewed click, click, announced that he was ascending the face of the cliff. I could hardly comprehend this manœuvre, which seemed to indicate the escape of the man we were the most anxious to secure, and the order to shove off was just on my lips when a powerful blue-light flamed suddenly forth, accompanied by a fierce but indistinct shout, or roar rather, from Somers. The men replied by a loud cheer, and we shot smartly out; but having, to avoid a line of reef, to row in a straight direction for about a cable's length, the smugglers, panic-stricken and bewildered as they were, had time to get way upon their lugger, and were plying their sweeps with desperate energy before the revenue-boat was fairly turned in direct pursuit. The frantic effort to escape was vain, and so was the still more frantic effort at resistance offered when we ran alongside. We did not hurt them much: one or two were knocked down by the sailors' brass-butted pistols; and after being secured, they had leisure to vent their rage in polyglot curses, part French, part English, and part Guernsey *patois*, and I to look round and see what had become of Cocquerel.

The blue-light still shed a livid radiance all around, and to my inexpressible horror and dismay, I saw that the unfortunate man was suspended in the rope cradle, within about a fathom's length of the brow of the cliff, upon which Somers was standing and gazing at his victim with looks of demoniac rage and triumph. The deadly trap contrived by the inexorable old man was instantly apparent, and to Cocquerel's frenzied screams for help I replied by shouting to him to cut himself loose at once, as his only chance, for the barrel of a pistol gleamed distinctly in the hands of Somers.

'Lieutenant Warneford,' cried the exulting maniac—he was nothing less—'I have caught this Cocquerel nicely for you—got him swinging here in the prettiest cradle he was ever rocked in in his life—Ha! ha! ha!'

'Cut loose at once!' I again shouted; and the men, as terribly impressed as myself with the horror of the wretched smuggler's position, swept the boat rapidly towards the spot. 'Somers, if you shoot that man you shall die on the gallows.'

'Cut himself loose, do you say, lieutenant?' screamed Somers, heedless of my last observation. 'He can't! He has no knife—ha! ha! ha! And if he had, this pistol would be swifter than that; but I'll cut him loose presently, never fear. Look here, Jacques Cocquerel,' he continued, laying himself flat down on the cliff, and stretching his right arm over it till the mouth of his pistol was within a yard of Cocquerel's head, 'this contains payment in full for your kindness to Ally Somers—a debt which I could in no other manner completely repay.'

At this moment the blue-light suddenly expired, and we were involved in what by contrast was total darkness. We could still, however, hear the frantic laughter and exulting gibes of the merciless old man in answer to Cocquerel's shrieking appeals for mercy; and after a while, when the figures of the two men had become partially visible, we could distinguish the words, 'One, two, three,' followed by the report of a pistol, and a half minute afterwards a dark body shot down the white face of the cliff, and disappeared beneath the waters!

The body of Cocquerel never reappeared, and the only tidings I ever heard of Somers were contained in the following paragraph which I read some years afterwards in the 'Hampshire Telegraph,' a journal at that time published at Portsmouth:—

'The body of an aged, wretched man was found frozen to death in the churchyard on Wednesday morning last, near two adjoining graves, one of which, that of Alice Maynard, recalls the painful circumstances

connected with the sad story of the death of that ill-fated, and, as we believe, entirely innocent person. At the inquest holden on Friday, it was ascertained beyond a doubt that the deceased is John Maynard, who, after his wife's untimely death, assumed the name of Somers, and was, we believe, the person who shot a French smuggler, with whom he had quarrelled, at the back of the Isle of Wight, under somewhat peculiar circumstances, about seven years ago. He was buried in the grave that contains the body of his son, John Alice Maynard, which was interred there shortly before the commission of the homicide just alluded to. There has never been to our knowledge any regular investigation of that affair, but we believe that then, as before, Maynard's pistol was pointed by a frantic and causeless jealousy.—[*Plymouth paper.*]

There are several mistakes sufficiently obvious to the reader in this paragraph, but of the main fact that John Somers, *alias* Maynard, perished as described in the Devonshire journal, there can be no reasonable doubt.

VISIT TO THE ABERDEEN COMBWORKS.

SINCE the days when King David I., of saintly memory, erected into a bishop's see 'the haill village of old Aberdon'—since the time when salmon-fish and granite-stone first became articles of its local export in the thirteenth century, Aberdeen has continued to maintain a character of singular enterprise and originality. Notwithstanding its many natural disadvantages and remote situation from the great produce-markets of the country, it has, nevertheless, with the quiet though determined perseverance which characterises its inhabitants, gradually assumed an important position as a seat of our Scottish manufacture, and bids fair at no distant date to be as much celebrated for its superiority in this respect as it has been in past ages as a school of philosophy and learning. On more than one occasion we have adverted to the progress of Aberdeen, and not only with regard to its material prosperity, but also to the liberal and enlightened spirit with which those perplexing social questions are treated that conspire so much to disturb the peaceable and harmonious progress of society. To this place we are indebted for the first successful example of that class of humble yet serviceable educational institutions that have since become so widely known as Ragged Schools; and even in the apparently unimportant subject before us, it can easily be perceived that something like the same characteristic energy is exhibited.

Within our recollection, combmaking was considered one of the most miserable of trades, and equally destitute of anything like an organised *modus operandi* with that of the perambulating artisans who possessed a certain skill in the fashioning of rams' horns into spoons and rejoiced in the ancient and expressive designation of Horners. On a late visit to Aberdeen, however, we found the manufacture of combs carried on there not only to an extent far exceeding our preconceived notions of the trade, but flourishing in a state of high and skilful organisation; and we hastened to visit the combworks of Messrs Stewart, Rowell, & Co., who possess the reputation of being by far the largest combmakers in this country or in the world. There is another manufactory in Aberdeen, that of Mr John Macpherson, on a much smaller though still considerable scale. We have no room to follow the steps by which Aberdeen came to be the seat of this particular branch of industry; but before describing the system of combmaking there, we shall take a short retrospective glance at the general history of the comb, in order to illustrate the various changes it has passed through, and its gradual elevation to a respectable position in the manufactures of the country.

It is impossible to state with any degree of accuracy the time when this implement first became an indispensable requisite of the toilet; but from what we can glean from the ancient writers it would appear to have been of Egyptian origin. The Greeks and Romans used combs made of boxwood, which they obtained, as we do ourselves, from the shores of the Euxine Sea; and the mountain-ridge of Cytorus, in Galatia, was particularly celebrated for this product. According to a modern Italian author (Guasco), combs were also formed of silver, iron, bronze, but in no instance do we find the modern material of shell or horn. In addition to the wooden combs found in their tombs, it has been proved that the Egyptians had ivory combs, toothed on one side, which gradually came into use among the Greeks and Romans; but from specimens of the remains of combs found at Pompeii, together with representations on the Amyclæan tables, it would seem that the Greeks, who were remarkably studious and careful in arranging their hair, used them, with teeth on both sides, exactly similar to our small-tooth-combs.

The mediæval progress of the comb exhibits, like everything else of its class, much curious elaboration with but little improvement in utility. In the fifteenth volume of the 'Archæologia' there is a representation of an ivory comb found in the ruins of Inkleton Nunnery, Cambridgeshire, containing some Anglo-Saxon design exquisitely carved in relief, but with such teeth as a common boor in our day would treat with contempt. About this period we find Chaucer commenting on the many absurd articles of female attire, at a time when both sexes tied up their hair in a 'licorous fashion' with ivory pins; and, curious enough, one of the earliest specimens of English combs extant was dug up in 1764 from beneath the lowest of the three paved streets, which lie—memorials of their several ages—under the present Shiprow Street of Aberdeen; and it was supposed to have lain there ever since Edward III. burned and ruined the city in 1336.

In modern days the comb probably reached its most costly and ornamental state at the luxurious court of Louis XIV., where hair-dressing was an art more appreciated and often better paid than the higher efforts of genius. Combs of ivory and of tortoise-shell, richly inlaid with gold and pearl, formed an essential adjunct of the toilet of the court beauties of Versailles. In this country the fabrication of horn into combs was a very ancient process, and chiefly resided, as it still does, in England, in Yorkshire and the midland counties. But towards the end of last century the increased demand for combs established makers all over the country; and in Scotland there were one or two houses of some eminence in the trade at the period—some twenty-five years back—at which we have now arrived. It was, however, one of those trades that, in so far as its artificers were concerned, would not stand investigation. Making combs on nearly the same principles as those pursued by their forefathers for generations before them—that is to say, by simply cutting out the interspace between the teeth with various sorts and sizes of saws—its followers, barely entitled to the name of skilled workmen, were dissipated, unsettled, and irregular in their habits.

We come now to treat of the grand era in the comb trade—of the time when it was destined, like the great staple manufactures of our country, to undergo a revolution. The introduction into the trade of machinery and steam-power, with, as a collateral result, the division of labour, is at once suggestive of an important stride in the march of progress. About the year 1828 Mr Lynn invented a machine of a singularly ingenious design and construction, having for its principal object that of cutting two combs out of one plate of horn or tortoise-shell; and two years afterwards Messrs Stewart, Rowell, & Co. commenced the manufacture

in Aberdeen. To the first of these circumstances the trade was indebted for the successful idea of a machine, which effected at the same time a saving of half the material, and an increase of produce almost inconceivable. To the latter it is still more indebted for the first application of steam-power to the machinery; and, what we think of infinitely greater importance, the introduction of those true principles in the philosophy of production so logically contended for by Adam Smith—a philosophy which, in its legitimate application, has the invariable effect of elevating alike the character of the produce and the producers.

We shall, however, most appropriately represent the combined effect of these improvements on the trade by taking the reader along with us in a cursory view of the principal departments of the Aberdeen Comb-works. Provided with an intelligent cicerone in the person of one of the clerks of the office, we began our investigations; and as an essential preliminary, were first shewn specimens of the various kinds of raw material. In the order of its intrinsic value this consists of tortoise-shell, horns, and hoofs. Ivory in our day is reserved almost exclusively for the manufacture of small-tooth-combs, which forms a branch of the ivory trade, and is entirely distinct from the one now before us.

Of the first of these materials, tortoise-shell, the best adapted to manufacturing purposes is the shell, or rather scales of a horny texture which enclose the sea-tortoise, *Testudo imbricata*. It is to be found in all warm latitudes; but the best species are indigenous to Hindostan, the Indian Archipelago, and the shores of the Red Sea. The price of this article we are apt to think excessive. At present it is 35s. per lb., and ten years ago it was nearly double that price. It forms, however, a valuable article of importation.

There are two chief divisions in the second article, horn; namely, buffalo and ox horns, both of which are imported from various parts of the globe. Buffalo-horn is, however, for the most part used in the manufacture of knife-handles, and such-like articles in the cutlery trade. In combmaking it is chiefly used for dressing-combs; and, generally speaking, all combs of a deep black colour are formed of this material. The best buffalo-horns are obtained from the East Indies, and incomparably the finest are those of the Indian buffalo from Siam. We were shewn a beautiful specimen of Siamese horns, which, from their extraordinary dimensions, had been preserved and polished. One of them measured 5 feet from tip to base, 18½ inches in circumference at the widest part, and weighed 14 lbs. Some conception may be formed of the extraordinary size of an animal which can support such a weight on the frontal-bone, if we recollect that a good specimen of an English ox-horn weighs only 1 lb.

Ox-horns, again, constitute the staple of comb-making, and are imported into this country along with hides from the South American states, the Cape of Good Hope, and New South Wales. The imports, however, are chiefly sustained from the enormous herds of South American black-cattle, which have multiplied to such an extent in the Brazilian territories that they are now slaughtered for the sake of their hides and horns, and their carcasses left to be devoured by the innumerable carnivorous animals which infest the jungles. The ox-horns entered for consumption in Great Britain in 1850 numbered 1,250,000; and the average price is about L.50 per ton.

The material of hoofs depends for its supply on the German and home markets; and its value at this moment is about L.12 per ton. Hoofs are used generally in the manufacture of the cheapest description of combs; but although the least valuable material, it is the subject of the most costly and ingenious mechanical appliances in the process of its manufacture.

At the time of our visit the quantity of horns and

hoofs in stock amounted to upwards of one hundred tons of each. This immense mass of horns was contained in a large storehouse for the purpose, a glance into which has a curious effect on the visitor; and in truth we could not repress a thought somewhat akin to what we might have entertained on seeing the like quantity of human skulls. Enormous piles of different varieties of horns—from the delicate curvature of the small Highland ox to the equally beautiful but enormous *cornu* of the ferocious buffalo of the Cape; from the Smithfield horns, immortal in story, to those of the gigantic buffalo of Thibet and Siam—all lay prostrate here, piled together in inextricable confusion.

After taking a look at the steam-engine, which is of fifty horse-power, and we were informed the largest of the horizontal kind in Scotland, we proceeded to the first stage of the manufacture, where the horns are cut into assorted sizes by means of a circular saw. A horn is twice cut transversely, and afterwards, if a large one, longitudinally. The tips or extremities of the horn here cut off are sent to Sheffield, where they are converted into table-knife and umbrella handles; and in this operation 16,000 horns can be cut up in a week. Instead of being divided in this manner, the hoofs in their first stage are, after being boiled for a certain time, to render the fibre soft, cut into two pieces; or rather the sole is stamped out by means of vertical punching-machines of the same irregular conformation.

The horns and hoofs thus cut are then brought in pieces into the pressing department, which occupies the whole basement-floor of one part of the building. The first thing that strikes the visitor on entering here is the peculiar and easily-distinguishable odour of burnt horn, which indeed is also predominant throughout the works. This arises from the high temperature necessary to the fabrication of horn, which to a greater or less extent effects decomposition of the material, and is invariably accompanied with the disengagement of the peculiar gases which create the odour. Along the floor of this department are erected thirty-six furnaces of a peculiar construction, and at each of these a man and boy were busily engaged in shaping the cut horns into flat plates, by first heating the pieces and then cutting them to the required shape with a knife: they were then inserted between screw-blocks, and pressed perfectly flat. If, however, the plates are required for stained combs, as the greater part of them generally are, a different mode of pressing is pursued. Into a rectangular cast-iron trough about 2½ feet long by 12 inches wide and deep, a number of iron hot-plates are put; they are then oiled on their surface, and the plates of horn inserted between them; a wedge is next driven into the press by the percussion-force of a ram, or weight falling from a height of eight feet, producing a force of about 120 tons. This pressure exercised on the horn contained within the iron plates has the effect of breaking the fibre to a certain extent, and forcing it to expand in a lateral direction. Curious enough, whatever may have been the original colour of the horn, it is now of a uniform dark-green colour, and perfectly soft. This peculiar treatment renders the horny tissues more pervious to the chemical action of acids, and will be better understood when we arrive at the subsequent operation of staining.

But the ram and wedge is not the only means of pressure employed. Around the apartment were arranged 120 iron screw-presses—levers of the second order, and differing only from a common vice in pressing under the screw after the manner of nut-crackers. They are fitted with steel dies with a variety of engraved designs, and into these braid-combs, the outside coverings of pocket-combs and side-combs are pressed. In accordance with the spirit of the times, we were shewn a new impression on pocket-combs of a very nicely-executed representation of the Crystal Palace. A man exert-

ing his strength on one of these presses can produce a force of upwards of fifty tons. But however great, the pressure is still insufficient. The enormous demand for the cheap side-combs formed of hoof led to the farther application of hydraulic pressure. The two portions of the hoof produced in the first stage are brought into this department, and after being boiled a second time in a number of little troughs, with a steam-jet in each of them to preserve the necessary temperature, the fleshy matter and other excrescences still adhering are pared off. They are then transferred to an adjoining room, where sixteen hydraulic presses are at work, by means of a small oscillating engine of three or four horse-power for their exclusive use; and here those little strips of hoof are subjected to a pressure of 300 tons, and with a degree of speed and precision that is truly astonishing. They come out of the press in the form of small semi-transparent rectangular plates, having on each side the rounded projection or beading observable on most side-combs. We may remark here that this application of hydraulic pressure seems to us to be highly ingenious. In pressing a bale of cotton goods, for example, it is to a certain extent immaterial whether the pressure exceed that required by a few tons; but with the fibrous tissue of a plate of horn the case is widely different: pressure it will sustain to a certain point, but should this be exceeded by a single ton or a single pound, the fibre is split and broken, and the material destroyed. To illustrate the resistless force of this pressure, we were informed that the very cast-steel dies which give shape to the hoof soon become crushed and worn out; and it was not without some nice calculation and experiment that the application of hydraulic pressure to the purpose was thus successfully attained. After having received the necessary formation by the various modes of pressing, the plates are laid aside to dry in a room where a high temperature is preserved by means of steam-pipes, and where they are also assorted into different sizes, and the edges squared with circular saws. The number of such plates, of shell, horn, and hoof, in stock at the time of our visit, was somewhere about four millions and a half!

From this they are again distributed to the different processes in order—the next of which is cutting the teeth. Certain classes of horn-plates, however, are subjected to a farther process of planing on the surface preliminary to this operation; but in all plates which have been hot-pressed, and are intended to be stained, this is unnecessary, and therefore they are at once taken when perfectly dry to the cutting department.

On entering this department the visitor gets a little bewildered. The incessant and peculiar clatter of the machinery—unlike any noise we ever heard—the heat of the place, and apparent confusion, produce together a most curious effect. A very little observation, however, serves to shew that we have now arrived at the basis of all the modern improvements in combmaking. Situated on benches around the apartment, in close proximity to each other, were twenty-four ‘twinning-machines’—the invention, with all its subsequent improvements, to which we have referred. Each of these machines is worked by a man, with an attendant imp, who keeps up a supply of hot plates from the numerous fires arranged for that purpose in the centre of the room. It is impossible without diagrams to explain the principles and construction of this ingenious apparatus; but there can be no mistaking its effect. A plate of horn, after being heated, is placed on a small carriage within the cast-iron frame of the machine, which travels by means of a particular arrangement of gearing on parallel slides. Immediately over this are situated two angular-shaped chisel-like cutters, which, on the application of the motive power, descend on the horn with a curious alternating motion, and an incon-

ceivable degree of rapidity and force. Almost in a moment before we could well see, far less understand, the rationale of the process, we were shewn the plate of horn cut in two pieces—the one half literally taken out of the other; and each of them presenting the well-defined outline of a comb. In this cutting department resides the perfection of that beautiful mechanism that first revolutionised the trade and reduced it to mathematical precision. To appreciate this invention we have only to look at the increase it has effected in the produce. A combmaker of the old school could not perhaps, with all his skill, cut more than eighty or a hundred combs per day; while with the machinery one man and a boy will cut upwards of two thousand of the same kind of comb, and that, too, with a consumption of only half the material. The finer dressing-combs, however, and all small-tooth-combs, are still cut by means of circular saws, which process constitutes the next cutting department. Here, however, a moderately curious visitor will not linger. A dense atmosphere of horn-dust pervades the large apartment, which gives to everything within its influence the white dusty appearance that distinguishes a flour-mill, to which indeed at first sight it bears a striking resemblance. From the few hurried notes we took, however, we learn that here there are wheels on the fine self-acting machinery, in connection with the cutting and pointing of combs, that revolve 5000 times in a minute, and saws so delicately fine as to cut forty teeth within the space of an inch.

We here instituted some inquiry as to the effect on the operatives of this animalised atmosphere, and were informed that it was not known to be injurious. On the contrary, it was stated as a singular fact, in connection with the late visitation of cholera in Aberdeen, that not a single combmaker had been affected by the disease, at least fatally; whence it may be inferred, although we do not pretend to assign the reason, that the fabrication of horn must be attended with considerable anti-miasmatic effects. At all events it is certain that horn-dust cannot exercise that injurious action on the air-passages and the lungs which is experienced in many trades, such as that of the steel-grinders of Sheffield.

Passing over one or two intermediate stages after the combs are thus cut and twinned—such as ‘thinning’ on the outer edge by means of grindstones, and ‘pointing’ by means of peculiarly-shaped bevel-saws—we arrive at the next department in order, where the necessary finishing is given to the comb by the hand. Here we meet with the only true remains of the artificers of combs that were, who still, with a pertinacious reverence for ancient usages, preserve among themselves the appellation of combmakers *par excellence*, forgetting that the very boys and girls in their respective departments play as important a part in the aggregate production. And yet, in their peculiar province, they are well deserving of commendation. The specimens of elaborate and skillful ornamentation displayed here, especially on ladies’ braid-combs, were truly admirable; and one pattern in particular was shewn us wherein there was a species of chain, formed of beautifully-stained horn, interwoven with the head of the comb, which, although we examined minutely, and knew there must have been a joint in each alternate link, we nevertheless failed to discover it. It is in this department that the teeth of the combs are smoothed and rounded—an operation technically termed ‘grailing’—which is effected by different sorts of cutting rasps. So far as the making or formation is concerned, the combs are now finished.

At the opposite side of the buildings we were then taken to the department where the staining process is carried on. This will be better understood if described as the imitation on the various classes of combs of the natural diversity of tint in tortoise-shell. The horn,

whether in the form of plates, as in the side-combs, or after being 'twinced,' as in dressing-combs, is first immersed in diluted nitric acid, which, with its characteristic action on all organised tissues, creates a deep and permanent yellow stain. This resembles the ground colour of tortoise-shell; and to produce the peculiar variegation, the horns are then treated with a particular composition of the red oxide of lead with certain alkaline compounds, which has the effect of first neutralising the action of the acid, and then of imprinting a stain of a deep orange colour. After being carefully washed, dried, and polished, the surface of the combs presents the beautiful and natural appearance of tortoise-shell. Indeed the imitation is so perfect in the best classes of stained combs, that a practised observer only can detect it. We were shewn, for example, two specimens of braid-combs, one of real tortoise-shell and another of stained horn; and so much alike were they in their colour and external configuration, that we could not tell which was which, and yet the one comb was worth somewhere about ten times more than the other. This operation of staining, which, on the whole, is a somewhat artistic operation, is exclusively performed by women and girls.

There are still some minor departments, which we need not describe in detail. 'Buffing' consists in smoothing the rough surfaces of the horn by means of wheels covered with walrus skin. Side-combs and braids are bent to their peculiar curve by being first heated and then fastened to wooden blocks—an operation that lasts only a few minutes. Pocket-combs have of course a different and peculiar treatment in some stages; such as the formation of the joint, and the putting together of the handles. And there is a department in the works exclusively devoted to the fabrication of horn-spoons, which becomes chiefly remarkable from the circumstance of there being no modern application of machinery to the manufacture. The last process, however, to which all combs are subjected, is that of 'polishing,' which is also effected by means of wheels, but covered with leather of different degrees of softness. After this they are despatched to the warehouse, to be assorted for the last time—the side-combs being stitched to cards, or packed in fancy-boxes, which affords constant work to about twenty women. From hence the combs are distributed over the three kingdoms, to fulfil the great end of their existence. We may add here, that the curious and intricate machinery now employed in the manufacture is made on the premises.

As an appropriate finish to our inspection, we were shewn the patterns of the different kinds of combs, many of them exceedingly beautiful; but we can only notice them in regard to number. Of dressing-combs (counting the different sizes of all the patterns), there were 605; ladies' braid-combs, 612; ladies' side-combs, 525; pocket, small-tooth, horse combs, and sundry articles, 186: in all, 1928 different varieties of combs.

The aggregate number produced of all these different sorts of combs averages upwards of 1200 gross weekly, or about 9,000,000 annually; a quantity that, if laid together lengthways, would extend about 700 miles. The annual consumption of ox-horns is about 730,000, being considerably more than half the imports for 1850; the annual consumption of hoofs amounts to 4,000,000; the consumption of tortoise-shell and buffalo-horn, although not so large, is correspondingly valuable: even the waste, composed of horn-shavings and parings of hoof, which, from its nitrogenised composition, becomes a valuable material in the manufacture of prussiate of potash, amounts to 850 tons in the year; the broken combs in the various stages of manufacture average 50 or 60 gross in a week; and finally, as the crowning illustration of the enormous extent of these combworks, the very paper for packing costs L.600 a year.

There are so many beautiful instances of the division of labour here exhibited, that the task of selecting is not easy. But let us take for an example the cheapest article in the trade; namely, the side-combs, sold retail at 1d. per pair—an article that, in its progress from the hoof to the comb—finished, carded, and labelled 'German shell'—undergoes eleven distinct operations. This comb, then, which twenty years ago was sold to the trade at 3s. 6d. per dozen, can now be purchased in the same way for *two shillings and sixpence per gross*! thus effecting a reduction in price of about 1600 per cent.

As a curious illustration of the value of labour, we give the following comparative estimate of the produce of the three materials:—

1 cwt. shell, val. L.200, produces combs, val. L.275, inc. 37½ per cent.					
1 ton horns, ... 56, 150, ... 168					
1 ton hoofs, ... 12, 36, ... 900					

Regarded in this aspect, in the relation of labour to material, we find that hoofs—intrinsically the least valuable of the three materials—become, with the application of labour, the *most valuable*—that is, proportionably: and the converse holds good in the case of tortoise-shell. The important relation labour bears to the produce may be estimated from the fact, that this establishment pays a larger sum of weekly wages than is now paid for the important business of cotton-spinning in Aberdeen.

Thus much, then, for the produce; and with a cursory glance at the producers we conclude.

At the time of our visit there were in the employment of Messrs Stewart, Rowell, & Co. 456 men and boys, and 164 women—in all, 620 hands—exactly four times the number employed in the comb-trade in all Scotland when they commenced business. This class of artisans were formerly noted for their dissipated habits; but in the present day we were much struck by the quiet and orderly appearance of the men as they poured out of the work at six o'clock. It occurred to us, however, that all this organisation and improvement was not brought about without considerable difficulty and trouble; and we were right. In a conversation with one of the partners, that gentleman, in reply to our inquiries on this point, remarked: 'We know from hard experience a little about the improvement of the working-classes. It is no easy task. Twenty years ago, when we commenced business, we did so under many disadvantages. We had all the difficulties of an overstocked market to contend with; a powerful and well-connected opposition in the English market; defects in our machinery; and other circumstances equally discouraging. We surmounted all these only to find a still greater difficulty with our men. In the habit of working irregularly at home, like tailors, they disliked our systematised division of labour; they resisted, rebelled, and left their work on more than one occasion when they knew we required them most. Nevertheless, we stuck to our principles. We shewed them the necessity of consistent labour for ten hours a day six days in the week. We reasoned with them, but never coerced. We established a temperance society and library in the works, and held out a premium to members, and took every means of rewarding merit, until the conviction at length took root that they obtained substantial justice at our hands, and gradually the annoyance became less, and now is unknown in our works. At this moment we have infinitely less trouble in managing 600 people than we had at one time in managing fifty.'

Conveying to this gentleman our best acknowledgments for his kindness in our brief visit, and especially for the courteous manner in which our somewhat numerous inquiries had been answered, we took our leave of the Aberdeen Combworks—in many respects the most interesting of a numerous class of apparently

insignificant, but really important, branches of manufacture. We were kindly furnished with specimens of side-combs in their various stages, from the hoof to the comb, which we have since had properly labelled, and classed in our 'curiosity shop' as one of the most remarkable illustrations in our day of the division of labour with the aid of machinery.

A DAY'S DREDGING IN SALCOMBE BAY, DEVON.

MICROSCOPIC RESULTS.*

LITTLE should we know of the wonders of the great deep if we merely took note of the forms of life which are visible to the unassisted eye. Almost every tuft of coralline or weed is the seat of a numerous population, of which only the microscope can give us tidings. We cannot estimate the treasures we have gathered until, when the day's work on the water is over, we sit down to the instrument, and find that the spots we had deemed waste are teeming with life and beauty, and that the smallest creature we had recognised is a monster as compared with the pigmy tribes which were swarming unseen around it. We place a portion of one of the larger zoophytes which we have brought home living in a watch-glass containing sea-water, and submit it to the microscope. It is in itself a beautiful object, and we watch with delight the milk-white polypes issuing from their little cells and unfolding themselves like delicate blossoms on the branch. But we soon discover that the fragment before us is infested by a parasitic population; that its surface is covered with minute but wondrous forms of animal and vegetable organisation. That which to the naked eye appears as at most a roughness on the branch, is rendered by the microscope into a multitude of beings, each perfect of its kind, presenting us with the most admirable structure, and often with an exquisite beauty. Most of them belong to the great class of the animalcules—creatures which are universally distributed, which swarm by countless millions in the waters of the earth, and make every lonely pool a scene of busy life and happiness. Minute and insignificant as these beings are, they have a most important mission to fulfil. Their amazing numbers enable them to accomplish works which may truly be called gigantic. A great comparative anatomist has happily styled them, 'Nature's invisible police.' They are commissioned to arrest and bring back the fugitive particles of organised matter when on the point of escaping into the inorganic world. By feeding on the decaying animal and vegetable substances, which are held in solution in the water, they prevent them from passing off into a gaseous state, and convert them into a wholesome pabulum for other and higher tribes. They thus economise for nature, and keep up the supplies of food. They prevent waste—they gather up the fragments: they are also sanitary agents—they form a mighty host of scavengers, and clear the waters of the putrefying matter which would otherwise pour volumes of noxious vapour into our atmosphere.

There are many members of this useful class on the piece of zoophyte now before us. We will examine a few of them. The most numerous and the most graceful are the bell-shaped animalcules (*Vorticella*)—creatures so lovely that the description of them should only be entrusted to the poet. We will attempt a prosaic sketch, but without hoping to do justice to the original. The vorticella consists of a transparent, vase-like body, mounted on a slender, pellucid stem, which is attached to some foreign substance, and can be swayed to and fro at the pleasure of the animal. At the upper extremity of the little vase is the mouth,

and around it is set a circlet of vibratile hairs (cilia), which, by their rapid play, create currents in the water, and whirl the nutritive particles towards the opening. This beautiful ciliary fringe can be retracted at will. Within the body we may distinguish a few globular sacs, like coloured specks in a crystal vessel, which, when the creature is feeding, are in a state of restless motion, and may be seen to circulate at times round the interior cavity. These are probably locomotive cells which receive the food, and distribute it through all portions of the tiny organism. Such is the general structure of these simple beings. Let us watch one of them for a moment. The slender stem is extended to its full length, and swings to and fro (there is a peculiar *grace* in all the movements) beneath the pretty calyx. The cilia are in full play, and a stream of atoms—the 'delicacies of the season'—is hurrying into the mouth of the little *gourmand*. When suddenly alarm is taken, and with the rapidity of thought the cilia are withdrawn, the body contracts into a ball, and the stem into a most beautiful spiral. After the lapse of a second or two the spiral slowly uncoils, the body rises majestically, and the eager pursuit is resumed. Beauty is the great characteristic of these little creatures. It appears in their form, their movements, and their structure. The vorticella are amongst the commonest of microscopic beings. The observer encounters them at all points, and often in the most unlikely localities. Is he examining a drop of ditch-water?—he finds them clustering about every speck of scum which it contains. He detects a minute, irregularly-shaped mass on the stem of a water-plant: as he watches it, it begins to rise, and at last expands into an arborescent vorticella—a miniature tree, the branches of which are all laden with the ciliated bells. A water-flea, or the larva of some insect, makes its appearance beneath the lens, carrying a whole company on its back. Our piece of zoophyte has a multitude upon it, and the little things are darting up and down even amongst the tentacles of the polypes themselves.

A still more curious and beautiful form of vorticella is also present. Here are several little *plumes* of the most symmetrical shape and the extremest delicacy. They might be feathers dropped from the wing of some microscopic bird. Each plume is a compound being. The little branches bear multitudes of the vase-like bodies which we have just described, and their thousands of cilia keep the surrounding fluid in a state of constant agitation. Each of the minute beings associated in this plumose commonwealth enjoys a certain amount of independence—selecting its own food, and employing its cilia at pleasure; but all are subject to a central power or will; for let any cause of alarm present itself, the entire structure, as it were, crumples up, the branches cluster together, and for a time all signs of vitality disappear. Our readers must not forget that the wonderful forms of life which we are now examining are either altogether or all but invisible to the naked eye. We find the spirit of beauty represented in these minims as well as in the grander features of the universe. Wisely has it been said: 'That which we foolishly call vastness is, rightly considered, not more wonderful, not more impressive, than that which we insolently call littleness.'

Another microscopic form of life (*Cothurnia*) is abundant on the marine productions which our dredge has supplied. Imagine a perfectly hyaline case, bounded by lines of beauty which the highest art might copy, and set upon a short and rigid stalk or pedestal. Fixed at the bottom of this 'crystal palace' is a small body, in shape somewhat resembling an Etruscan vase. It rises slowly, stretching itself upward towards the entrance of its little mansion. Having reached it, it throws out a pretty circlet of cilia, which immediately begin to vibrate, and draw towards the mouth the nutritious particles which serve as food. When alarmed,

* See Journal, No. 379.

it suddenly retracts itself, and nestles snugly at the bottom. The body when extended is elongate and tapering, and is attached to the case. It is transparent, and the little sacs, such as we have described in the vorticella, are plainly visible within it. There is something singularly attractive in the graceful form and crystal-like transparency of these little mounted urns, and occurring, as they often do, in profusion on other marine animals, they contribute largely to the microscopic garniture of the ocean. It adds much to the pleasure which their mere beauty affords us to consider that each one of them gives shelter to a happy inmate, whose structure, though so minute, is perfect of its kind, whose little wants are all well supplied, and which witnesses as impressively in behalf of Providence as the most highly-organised and endowed of living beings.

But we must pass from the animalcules, taking no note of the multitudes, minuter far than those we have described, which swarm in each drop of water, and select an example from another tribe. Creeping over the stem which we are examining is a patch of delicate, silvery lacework, as it appears. It consists of a number of small calcareous cells, laid side by side, and forming a 'gauze-like incrustation.' Each cell has an aperture, which is guarded by several spines. It is a snug little home, and has a tenant that we shall presently describe. This structure is one of the moss-corals (*Bryozoa*)—an extensive tribe, which exhibits a comparatively high organisation, and plays an important part amongst the varied population of the 'great waters.' In the specimen under notice there may be some scores of cells; but a single community often comprises many thousands. Stretched over the opening of each cell is a membranous covering, towards one end of which there is a small valve, which opens so as to allow the owner of the dwelling—a polype of exquisite structure—to pass forth. And now one is issuing! The little door is thrown open, and a cylindrical body is protruded for some way, the anterior portion of which (it is a flexible sheath) is unrolled, as you would push out the inverted finger of a glove. From the extremity of this sheath a bundle of tentacles is darted out, which at length expands into a beautiful campanulate figure; and each of these tentacles or arms, which at first sight appear no more than simple filaments, is found upon close examination with the microscope to be thickly clothed with vibratile hairs, which by their incessant strokes drive currents of water towards the mouth, and so provide for nutrition. The internal organisation of these creatures, as well as the mechanism of their cells, is wondrously complete and curious; and the story of their reproduction is a little romance, which it were pleasant to tell had we space at command. Their movements are most vivacious. They dart from their cells, and for awhile the delicate bell-shaped crowns of tentacles are swaying gracefully over the silvery network. But if the water be roughly agitated they vanish on the instant; down they sink beneath the membranous roofs of their little dwellings, the door is close shut behind them, and you can detect no sign of life throughout the colony. There is an extraordinary variety in the form and arrangements of the cells in the different species. In some they form a simple network; in others, they are like little barrels, often curiously sculptured or prettily frosted and granulated; in others, they run along the surface of stone or shell, like a string of beads. The moss-corals occur in immense profusion. On almost every marine production they establish themselves, overlaying with their white and glistening crusts the bare surface of stones and the quiet hollows of deserted shells; investing the stems of zoophyte and sea-plants, and, in short, planting colonies in all conceivable localities, and turning many a waste place into a seat of life, beauty, and happiness. The broad fronds of the larger sea-weeds may often be

found completely 'overwrought with their network.' Mr Landsborough mentions a specimen of one of the tribe which measured five feet in length by eight inches in breadth. 'As every little cell,' he says, 'had been inhabited by a living polype, by counting the cells on a square inch I calculated that this web of silvery lace had been the work and the habitation of above two millions of industrious, and, we doubt not, happy inmates; so that this single colony on a submarine island was about equal in number to the population of Scotland.'

There are also other forms of bryozoa. In many kinds the cells, instead of creeping, are aggregated into plant-like tufts. Here is a little bush of ivory whiteness, rooted to a stem, which we have torn from some submarine forest. It has the general aspect of a plant, but is in truth a compound animal. Its branches are laden with tubular cells, and instead of flowers or fruit it bears polypes. A multitude of these little beings, each in its stony case, are here organically united to form one structure, and from every portion of it they display their ciliated arms, supplying at once their own wants and helping to maintain the common life. These plant-like bryozoa are also numerous, and their history is as full of interest as their forms are full of beauty. But we can dwell no longer upon them at present.

We turn for a moment to the microscopic vegetation which in wonderful profusion and variety spreads over almost every object that comes beneath the lens. We read of the beauty of palm-groves, and of tropical forests, draped with pendant parasites, whose flowers, cast into the most fantastic shapes, painted with gorgeous dyes, or tinted with ethereal delicacy, present a glory of colouring which only the sunset or the rainbow can rival. But hardly less beautiful, and certainly not less wonderful, is this miniature forest, which, all but invisible to the naked eye, clothes the stem of the sea-plant, and gives food and shelter to many tribes. Often have we paused in our search for animalcules through the tangled mazes of these Lilliputian groves to admire the strange and the exquisite forms of the vegetation, and to marvel at the beauty and variety which have been crowded into the obscurest nooks of creation.

The microscopic plants to which we refer belong principally to one family (*Diatomaceæ*). It were impossible in few words to give any idea of their manifold forms. Here is a little tree, the prettily-variegated leaves of which are arranged in fan-like clusters. Here we have a number of parallelograms, attached one to the other by a single corner, and forming delicate chains which intertwine and hang in glittering masses from the weed. Some of these little chains are richly and elaborately carved. Here is a plant, which in shape is a simple wedge; but the forms are endless, and strange enough they, many of them, are without parallel in the vegetable world. Nor is colour wanting in these tiny forests. Vivid greens, sober browns, and delicate golden tints, give diversity to the foliage. Again we must remind the reader that the *forest* which we have so imperfectly described is to the naked eye a mere scum on the stalk of a sea-weed!

Much more might be said of these interesting plants. They are amongst the most ancient of vegetable races. The records which they have left of their existence in distant geological ages are such as to fill us with wonder. Endowed with a power of secreting flint, and depositing it in their substance, they are in truth indestructible; and of their remains, minute as they are, whole beds of rock and tracts of country have been in great measure compacted. What changes may they not at this moment be preparing in the condition of our globe?

We have thus glanced at a few of the minute forms of life, animal and vegetable, which abound in the ocean, and which the dredger has the amplest opportunity of examining if he will, and we must now return to the bay and the boat. A fresh haul has just been

made, and amongst the spoils brought up are several of the beautiful creatures popularly known as sea-anemones. They are attached to shells or stones, but having contracted on removal from the water, they present none of the flower-like appearance from which their common name is derived. That their beauty may be fully appreciated, they must be seen displaying their glories beneath a summer sky, in the rock-pools left by the receding tide. There they expand their circlets of brilliantly-coloured arms, and through the clear water the surface of the rock appears as if studded with the choicest flowers. Most of the species have the power of retracting their tentacles within the body, and in this state would be little likely to attract the attention of any but the naturalist. Some of them are also furnished with glands on the surface of the thick skin which envelops them, by means of which they can attach to themselves sand, pebbles, and broken shells, and so conceal themselves from enemies. Often you may observe on the sandy flooring of one of these rock-pools a small heap, as it seems, of such fragments as are plentifully scattered about in the neighbourhood. Watch it for awhile, and soon, especially if the sun happens to look into the pool at the same time with yourself, you may see your little heap opening, and gradually several circles of delicate arms protruded from it, scarlet, orange, or rose coloured, as the case may be, until at length the sea-anemone is full-blown. The tentacles in these creatures are arranged in circular series around the mouth, which is a central opening, and are the instruments by which they obtain their food. They are well-fitted for this purpose, as they can be moved in all directions, and adhere with much tenacity to any object to which they may be applied. They also secrete a poisonous fluid which paralyzes and disables the creatures that may come within their reach. Very admirable instruments they are, and wo to the unwary crab or mollusc that shall tempt their fatal embrace!

One species, which is not uncommon on our coast, has the power of stinging severely, and will almost blister the hand if touched. It is gregarious, a number of individuals generally clustering together, and their long and slender arms (which are not retractile), of a bright sea-green colour, tipped with violet, may often be seen forming a lovely fringe round the margin of the rock-pools. Let no wanderer on the shore, whatever be his errand, if he have an eye for the beautiful, pass these same pools without notice. They will present him with some exquisite scenery. Their sides are clothed with the red tufts of the coralline, with the plumes of the zoophyte, and with whole forests of many-coloured weed; dark ribbon-like fronds stream upward from the bottom, ornamented here and there with patches of the whitest lacework; bright *nullipores* diversify the surface of the stones that lie scattered below; and the sea-flowers, rivaling in their tints the beauties of the garden, leave nothing to be desired in the way of colour.

A very pretty anemone (*Adamsia*) has come up in the dredge, which well illustrates the vividness and variety of colouring for which the members of its order generally are remarkable. The body is, for the most part, light, marked with the brightest purple spots; a pink line encircles the oral opening; and the arms are of a most delicate whiteness.

The polypes, by which the beautiful madrepora of tropical seas, the coral-reefs, and islands are formed, are closely allied in structure to our own sea-anemones. They are not simple animals, but a multitude of them are united together by a gelatinous crust, which secretes a stony skeleton, covered with cells, in which the polypes find shelter. Marvellous have been the operations of these little creatures. In primeval ages their skeletons contributed largely towards the formation of the solid crust of the earth. They are amongst the

mightiest agents in the world to-day, rearing their 'imperishable masonry' from the depths with 'toil unwearyable;' building islands for the future habitation of man, or fringing the shores which he now possesses with gigantic barriers, against which the ocean expends its fury in vain. They were at work in creation before man appeared in it, preparing it for him; and they are now effecting changes which he cannot suspend, and the results of which he may not predict.

Like the kindred anemones, these coral-making polypes are remarkable for the brilliancy of their colours. A traveller, describing the coral-reef, tells us that 'vivid greens contrast with more sober browns and yellows, mingled with rich shades of purple, from pale pink to deep blue.' A poet, too, has celebrated the beauty of the 'coral-grove,' where

'With a gentle and easy motion

The fan-coral sweeps through the clear deep sea;

And the yellow and scarlet tufts of ocean

Are bending like corn on the upland lea.'

He who has made acquaintance with the anemones of our own coast will readily believe in the glories of tropical seas.

And what are these leathery masses that lie so thickly at the bottom of the boat? Unightly enough they certainly appear on slight inspection, but the rough exterior covers a very delicate and perfect organisation. Examine one of them. It is a coarse, thick bag, with two orifices placed on prominences at one end of it. It has no arms, no locomotive or prehensile apparatus whatever. A most helpless being it appears to be. But if you could look within the sac, you would find that full provision has been made for all its wants. Beneath that rough covering are placed the most delicate organs, and wonderful machinery is continually at work, procuring, elaborating, and distributing the required nutrition. This being belongs to a class (*Tunicata*) which is nearly related in structure to the oyster, and other inhabitants of bivalve shells. One of our zoologists has likened it to an oyster tied up at the bottom of a leathern bag! The thick outer covering takes the place in this tribe of a shell, and defends the soft portions of the body. These creatures are attached to stones, shells, or weed, and are extremely abundant in the ocean. A very inactive life they lead, rooted to one spot, and shut up in their leathery houses. They have none of the excitement attendant upon the pursuit and capture of prey to diversify the quiet monotony of their existence. The water passing freely into the interior of the body through one of the apertures mentioned before, bears with it the particles which serve as food, and these are carried by the action of multitudinous cilia to the mouth, which is situated at the lower part of the sac. At first sight this appears a very extraordinary position for the mouth. But a little examination will shew us that it has been adopted with much wisdom for a definite purpose. The upper portion of the bag forms a large chamber, and over the membrane which lines it is spread a network of blood-vessels, in which the fluids are exposed to the action of the water, and thus aerated. This chamber, in fact, discharges the functions of a lung. The surface of the living membrane is covered with cilia, which drive over it unfalling streams of water, and so provide for an effectual oxygenisation of the blood. And these same cilia convey the nutritive particles to the mouth, which is placed at the bottom of the breathing chamber. In this way an important saving in machinery and power is secured. Had the mouth been placed in the usual position, as an opening on the surface, two sets of instruments would have been required—one for the purposes of prehension, the other of respiration. As it is, the very act of breathing procures food. Little can these humble creatures know of the 'cares of subsistence!'

In some of the tunicata the outer envelope is beautifully transparent, and the internal structure and vital movements can be readily observed. You may watch the circulation of the blood, the incessant vibrations of the cilia, and the action of the heart. The dredger is very familiar with the members of this class; and many are the interesting forms with which it supplies him. A large and handsome species is now lying in the boat, which somewhat resembles a mass of white porcelain. These curious gelatinous crusts, too (*Botryllus*), investing the stems of the sea-weed, the surface of which is tessellated with brilliantly-coloured stars, belong to the same tribe. They are compound tunicata; and the stars—green, blue, red, or yellow, which glitter so brightly amongst the dark foliage—are composed of many individuals, whose bodies are immersed in the mass, and ranged round a common centre. A strange form of life this is! We despair of giving any idea of the beauty of the large bunches of weed over which these compound animals have spread their stellate communities, graceful in form, and gay in colouring.

We have referred to the breathing apparatus of the tunicata. It is interesting to note the various methods by which the same function is provided for in different classes. Here we have a sea-slug (*Aplysia*) allied in general structure to the ravager of our gardens. In this creature the respiratory organ consists of an elegant plume-shaped appendage placed at the top of the body. The vessels are distributed over this, which, from its position, is always bathed by the surrounding water, and the blood flowing through them is freely exposed to the influence of oxygen. Gliding about amongst the branches of the weed, we meet with many members of another family of molluscs (*Nudibranchiata*). These are graceful creatures, related to the tenants of the univalve shells (that is, the whelk), but themselves destitute of all external defence. Their delicately and variously-coloured bodies are for the most part covered with appendages, prettily branched, and resembling miniature trees. These little trees, which wave through the water as the creature moves, are the breathing organs. In others of the tribe these arborescent tufts are aggregated at one point of the body, and form a circle of exquisite beauty, and not inaptly comparable to a flower in appearance and disposition. These beings, from the brilliancy and variety of their colours, and the gracefulness of their movements, may be said to take the place, in their own submarine groves, of the birds that fill the forests of the upper air.

The examination of these admirable provisions must surely impress the mind with a sense of the amazing resources of the great Maker! And what shall we say of the prevalence, the all but universal presence of beauty? It is superadded to almost everything in nature. The breathing organ of the sea-slug is a graceful plume; the case of the animalcule is of crystalline transparency, and moulded into a shape on which the eye rests with delight; the spine of the urchin is fluted and sculptured.

The most necessary pieces of structure devoted to the commonest functions are invested with a beauty which is in no way essential to their efficiency. 'The Spirit of God,' it has been eloquently said, 'works everywhere alike, covering all lonely places with an equal glory, using the same pencil, and outpouring the same splendour' in the obscurest nooks, and amongst the humblest organisms, as well as in the star-strewn spaces of heaven, and amongst the 'capable witness of His working.' This superadded beauty, which the student of nature meets with at every point in his researches, is a direct revelation of the divine spirit, which it were a miserable affectation to exclude from the science of nature. These things, of a truth, were hardly worth looking into if we might not connect them with the thoughts which they express.

Here we must bring to a close our notes on a day's dredging, leaving material enough for many papers unemployed.

A change has come over Salcombe Bay since we started in the morning: heavy masses of cloud have overspread the summer sky; the sea is curling and breaking into foam, as the wind sweeps fitfully over it; the submarine forests and grottos upon which we looked down in the morning through the clear, calm water are no longer visible; gloom has settled down on the distant cottage; and the cheerful cries have ceased in the neighbouring fields. A dismal bank of fog is, as it were, blocking up the entrance of the harbour, and the Bolt-Head, its rugged summit already shrouded in vapour, frowns a warning which we have no inclination to disregard.

COURT LETTERS OF THE SEVENTEENTH CENTURY.

Our readers probably remember the selections made in a late article from the manuscript collection of Sir James Balfour. In that miscellaneous store there are so many other documents of a curious and instructive kind that we cannot resist the temptation to present some further specimens of them. The first we shall select is a small prettily-written note, eminently pleasing both in its appearance and its contents. It is from the widowed Duchess of Lenox to King James I. of England:—

'MY SOVEREIGN LORD—According to your majestys gracious pleasure signified unto me, I have sent a young man to attend you, accompanied with a widows prayers and tears that he may wax old in your majestys service, and in his fidelity and affection may equal his ancestors departed: so shall he find grace and favour in the eyes of my lord the King; which shall revive the dying hopes, and raise the dejected spirits of a comfortless mother. —Your majestys most humble servant,

KA. LENOX.'

This letter has already been printed in one of the small volumes edited by Lord Hailes, of which but a very few copies, however, were circulated. But in the same collection of manuscripts there is another applicable to the same subject, which has never, so far as we know, appeared in print. We are almost sorry to draw attention to it, as it certainly is a sad contrast to the purity and affectionate beauty which seem to pervade the brief appeal to royal generosity. The document in question commences thus—it would be tedious to give it entire:—

'THE LADY DUCHESS OF LENOX—HER DEMANDS.

'Three thousand pounds per annum during her life, in lieu of 1500 pound lande sold for her lords debts, and in lieu of a jointure haveing brought 1500 pounds land more to the house of Lenox.

'Such averages as are due upon the Pattent of sweet wines—viz., from the date of the Pattent to the delivery thereof to the Lord Marquis Hamilton.

'The benefit of the Pattent of coles towards the charge of maintaining her children.

'A somme of money to discharge this halfe yeares expense, litle rentes coming in and no benefit at all by these pattents.

'After her decease 2000 poundes per annum to be confirmed to the Duke her son for 21 yeares, in lieu of the Pattents of the green wax and sweet wines, which in true value are worth 3500 per annum, and nevertheless her Grace will be contented on the former conditions to surrender them both to His majesty.'

The reader will see in this how coolly monopolies not only of the moderate luxuries of life, such as sweet wines, but of the necessities, such as coals, were dis-

posed of to the grasping nobility in that corrupt age. Times are surely improved since the day when a lady could unblushingly ask the produce of a duty on coals 'towards the charge of maintaining her children.' These monopolies or patents were a main cause of the discontents of James's reign, and of the actual conflict in that of his son.

The Duke of Lenox, whose widow shewed herself so able and active, was the son of that Esmé Stewart who brought King James into so much disgrace as a dissolute favourite. His successor had but a brief enjoyment of his honours and emoluments, since he only succeeded to the title in 1624, and died on the 22d July of that year. The widow was the daughter of Gervase Lord Clifden, who was committed to the Tower for threatening the life of Lord Keeper Bacon, and afterwards committed suicide; the duchess subsequently married the Earl of Abercorn. The son for whom she appealed so pathetically became Duke of Richmond. The solicitations in his favour were sufficiently effective; for he had emoluments and honours heaped on him both by James and his son. Clarendon says: 'He was a man of very good parts, and an excellent understanding, yet, which is no common infirmity, so diffident of himself that he was sometimes led by men who judged much worse. He was of a great and haughty spirit, and so punctual in point of honour that he never swerved a tittle. He had so entire a resignation of himself to the king, that he abhorred all artifices to shelter himself from the prejudice of those who, how powerful soever, failed in their duty to his majesty, and therefore he was pursued with all imaginable malice by them, as one that would have no quarter upon so infamous terms as but looking on while his master was ill-used.'

We turn to another curious application to the same quarter by a mother also pleading for patronage to her son. It is much longer than the Duchess of Lenox's, and very different in character. In appearance it is nearer than the finest printing, being in Roman letters, with finer hairstrokes than printing-ink or types can lay down, being only equalled in fineness by copper-plate printing. We give it exactly as it is spelt, for a purpose that will presently appear:—

'MOST MIGHTIE MONARCHE—Darré I presume upon th' honor and credit that I have had at divers tymes to speake your Royal Majesté, and hath ever found your highnes favour, and upon the gracios accepting of a litle work by this youth given to your Highnes at Striveling, called *Sidus Celeste*, as to make humble suite for this one and last thing to this my only sonne, who, having passed his course two yeares ago, would gladlie follow theologie, if it shall please God. Yet as Dedalus was not hable to frie himself of his imprisonment in the Ille Creta but by the help of wings mead of pennes and wax: even so my sonne is not able to frie himselfe of inhabilitie to effectuat this his affection but by the wings of your Maties letter, composed by pen and waxe, through the which he may have his flight happilie to sum fellowship either in Cambridge or Oxford as occasioun shall fall out; wherefore, gracios King, lett your most humble handmaid find this last favour in your sight to direct one of this noble men by you, to signifie your highnes will and command unto your secretarie, that when this my sonne shall notife unto him of any fellowship, he may recave without any hinderance your Majesties letter in the strictest maner. For the which I may have my tossed mynd releaved of the great cair I have perpetuallie for this said youth. And we all of us will never cease to beseech God to preserve and prolong your Majesties lyfe, with many happie and prosperous yeeres to reigne over us. Edinburgh, the xx of Juin 1620. Your Maties most humble subject,

ESTHER INGLIS.'

This Esther Inglis was so celebrated for her beautiful writing, that there are several biographical notices of

her. One of them is in 'Harding's Biographical Mirror.' She uses one of the forced metaphors of the day, and it is amusingly characteristic of a person distinguished for calligraphy, or the art of beautiful penmanship—one which then ranked with the fine arts, at least in the eyes of its professors. What was called the Italian hand—the same that is now written—was then coming into use, especially with women of high rank, and superseding the strange grotesque angularities presented by the Gothic, when used quickly, in familiar correspondence. A person like Esther Inglis, with great command of her pen, would, at an epoch like that, be of supreme importance, and doubtless she derived great part of her fame from the admiration of her achievements, by the ladies trying to acquire the Italian hand. The following is a letter from a lady who had acquired the fashionable form of writing, but had evidently little of the fundamentals of education, though she was a very great personage indeed—no other than the duchess of the all-powerful Duke of Buckingham, the favourite successively of James and his son Charles. She, too, writes to King James. The subjects of her letter, so far as they can be made out, will be deemed rather curious as occupying the attention of the modern Solomon. But the spelling is the most remarkable part of it. We must not judge of its rudeness by that of the present day, but it is fair enough to compare it with that of Esther Inglis; and in doing so, to conclude that the wife of the favourite before whom the greatest statesmen of the day trembled, had little better education than a chamber-maid of modern times:—

'MAY IT PLEAS YOUR MAT^{ty}—I have received the too boxex of drid ploms and grapes, and the box of violatt caks and chickens, for all which I most humbly thanke your Mat^{ty}. I hope my Lord Anan has tould your Mat^{ty} that I ded mean to wene Mall very shortly. I wood not by any means a don it till I had furst mad your Mat^{ty} acquainted with it, and by reason my cuzen Bet's boy has binn ill of latt, for fere shee should greeve and spyle her mylke, makes me very desirous to wene her, and I thinke she is ould eneuft, and I hope will endure her wening very well, for I thinke there was never child card les for the brest than shee dos, so I do entend to make trial this night how she will endure it this day. Praying for your Mat^{ty} health and long life, I humbly take my leve.—Your Mat^{ty} most humbell servant,

K. BUCKINGHAM.'

In the same collection there are a quantity of ill-conditioned scrawls, written by one who was evidently perfectly at his ease, and cared not what sort of paper he used or how he wrote—full of blots, interlineations, and all manner of literary patchwork. These are letters by the great Duke of Buckingham himself to his patron the king, who had endowed him—a fooliah, headstrong, insolent youth—with the principal offices of the realm, not excepting that of lord high admiral. In these letters, full of fulsome familiarity, and forming, indeed, an unsavoury specimen of the manners of the times, Buckingham signs himself 'Stinie.' This is the Scottish vernacular familiar for Stephen, and it appears that it was a name given by the monarch to his favourite on account of his resemblance to the apostle's representation in a picture. We shall give a short specimen of this correspondence, not taking the trouble of copying the spelling precisely, as we did that of the duchess. The reader will doubtless notice the bold dealing with important affairs of state, and the insolently-familiar conclusion. The letter appears to have been written at the time when parliament began to attack the duke, on the return of Charles I. from his romantic expedition to Spain. Buckingham was the projector of the expedition, and it was evidently through his pride and insolence that it became abortive. Here is the letter, selected as one of the shortest of those from the duke:

'DEAR DAD AND GOSSIP—The cause of my troubling

you so soon with a letter is, that there is a jealousy raised in the lower house, how that yet the two treaties are not absolutely broken off. The Prince, Hamilton, Pembroke, Lancaster, and myself, who have all seen your dispatch to the king of Spain, thinks if that was shewed to them it would fully content them. We all likewise think there is nothing in it but what they may well see; and because on Tuesday they pass the bills of subsidy, I think it will not be amiss to be read to them, which, if your majesty like and allow of, I will call for it of the secretary, and to-morrow morning read it to them. So craving your blessing, I kiss your dirty hands, and end your majesty's most humble slave and dog.

STANIE.

The fate of this vain coxcomb, whose power became almost unlimited throughout Britain, is well known: he was stabbed at Portsmouth while preparing to set out at the head of an expedition to raise the siege of Rochelle. The assassin was an insane lieutenant named Felton, who had served under him, and had been disappointed in his hope of being raised to the rank of captain. He dropped his hat while committing the murder, with a paper in it, shewing the direction of his insane malice. This paper was, by the way, in the possession of an autograph collector with whom we were acquainted, and formed the glory of his collection.

An assassination is always abhorrent to English feeling; and little as the duke was liked, either by the aristocracy or the middle classes, his death created a profound sensation. The collection of manuscripts of which we have been making use shews, however, that at least one man had a perverted enough taste to attempt to commemorate the event in exulting poetry. We wonder how any one in that age dared to preserve such a production. The self-esteem of authorship might tempt a man to write it, but there is nothing in its merits to induce a collector to brave any danger for its preservation. The commencement will be quite enough to satisfy the reader of its quality.

AN ENCOURAGEMENT TO YE NOBLE LIEUTENANT WHOSE SLEWE
YE GREAT DUKE FOR REDEMPTION OF HIS COUNTRY.

Immortal man of glorie whose brave hand
Hath once began to disenchant our land
From magique thralldomme. One proud man did mate
The nobles, gentles, commons, of the state,
Strook peace and warre at pleasure, hurles down all
That to his idoll greatness would not fall
With grovelling adoration. Sacred rent
Of Brittan, Saxon, Norman, Princes spent,* &c.

The allusions to Spain in connection with the Duke of Buckingham and Prince Charles naturally lead us to a volume of Sir James Balfour's Collection, which may be found to throw light on some mysterious intrigues of King James before he ascended the throne of England. The documents appear to justify a pretty prevalent suspicion, that he was endeavouring to secure the assistance of the Roman Catholic courts to aid him in ascending the English throne should it turn out that Queen Elizabeth indicated another successor, or that in any other way he might be likely to lose the support of the Protestants. Lord Semple, who had lived for a considerable time in Spain, appears to have been the moving-spring of these intrigues. His letters are extremely curious, and we would say from their spelling that they shew the writer to have forgotten his native language, and become imbued with Spanish. We shall conclude this article with the commencement of one of them, given exactly as it is spelt:—

It vill ples zour Magesti yat effir my arrual hir I conferrit with ye crunal [colonel] my cusing for tryall of ye King of Spains mening touartis Zour magestis titill to ye crune of Inoland qua merialit not litill yat in so vechti [weighty] a mater zour ma nader gef me

comissiune nor varrand in na sort. Aluayis he hes gotin satisfaxsiune to zour magesti and yat sua sekretlie as na man hir knauis of it safen ane of ye cunsull quha is his grit frind.'

THE FRENCH ON INDUSTRIAL TRAINING.

THE number for June last of that eminent periodical, the 'Revue des Deux Mondes,' presents us with an interesting article from the pen of M. Audiganne, devoted to *L'Enseignement Industriel*, which the author uses as a translation of our expression, 'industrial training.' We have repeatedly had occasion to comment on this important subject; but preparatory to some notice of the French views, we shall state briefly what we understand by industrial training as practised in this country. When the system of Ragged Schools was established, some gentlemen who had devoted their attention to practical economics, while they admitted that much good would be accomplished by them, questioned how far the system could be safely carried. They feared that there was a point at which we must stop in affording immediate homes to all children left destitute by their parents, especially if the establishments in which they were received merely gave them temporary occupation, without raising their capabilities or fitting them for self-support. In fact, carried to a certain extent, it might hold out temptations to parents who otherwise might provide for their offspring, to leave them to the always inferior resource of public charity. It was felt, however, that within the partial sphere which they as yet occupy there was an element capable of being introduced in these establishments which could not fail greatly to improve their usefulness, and make them effective for the permanent reformation of at least a portion of society—this was the system of industrial training. Now, to perceive the efficacy of this principle, observe that from their very commencement industry was associated with these institutions. The poor wanderers who received food and instruction in them were to be occupied in work: but in what work? Naturally in that most cheaply and easily supplied, and therefore, though this might not be obvious to the benevolent founders of the system, least valuable. The pupils were to pick down old ropes into tow or oakum; to sort hair and wool; to make mats, and nets, and the like. They were thus kept out of mischief for the time being, but were not permanently redeemed from pauperism. The occupations we have mentioned are all pauper employments, next door to utter idleness, and incompetent for self-support. They tended, then, to place the managers of the Ragged Schools in this dilemma—that after all their efforts they did little to raise the class for whom they so zealously laboured.

When we ask how these poor outcasts have become what they are, we find that their parents, perhaps their ancestors for generations, have descended from the productive or respectable classes to the unproductive or predatory. The waifs of society, even when they work, do not produce. Be it through thimble-rigging, pocket-picking, or begging, they live by the transference to themselves of what others produce—not by producing. It appeared, then, that if the children of these classes—so many of them at least as filled the Ragged Schools—could be brought from the unproductive class in which they were born into the respective and productive rank, there would be a clear gain to society. This was the principle on which training in skilled labour—in the occupation of the tailor, the shoemaker, the carpenter, and the smith—was applied to the Ragged Schools, which have been gradually changing their name to Industrial Schools. The French writer admits the solidity and unquestionable practical advantage of this element. He states that the principle of Ragged Schools is in itself not free

from question, and that economic criticism may find abuses in it, but that it has the merit of founding the industrial system (*Le régime des ragged schools n'est pas inattaquable. La critique économique y pourrait relever des abus; mais enfin L'Angleterre doit à ces écoles la première application un peu large de l'enseignement industriel.*)

The author justly attributes the merit of commencing the system to the United Industrial School of Edinburgh, where it is still among the best managed (*L'Unité Industrielle Ecole d'Edinbourg, une de celles où l'enseignement pratique est le mieux organisé, &c.*) In this establishment it has not only been found that lads, after they are there for from two to three years, are readily taken by tradesmen who give them good wages, and are thus fairly started in an independent career in life; but the training has been very useful to the discipline of the establishment in giving an object sufficient to occupy the minds of a set of creatures whose way of life has prematurely excited their energies and capacities.

Nothing, however, could exhibit better the contrast between the practical habits of the two nations than the Frenchman's commentary on this interesting, but in itself purely local and limited experiment. In France he would not have it confined to the operation of private benevolence, but would connect it with the national economy, and have a vast system of industrial training (*au lieu d'appartenir au domaine de la bienfaisance, les écoles industrielles deviennent en France une Institution économique.*) Thus in this quiet practical country, a few gentlemen go down a dark close, and get a few carpenters, tailors, shoemakers, &c. to teach their trades to a set of charity children, carefully watching the progress of the operation lest it turn out to be a fallacy in their hands. But no sooner does the brilliant and theorising Frenchman see its advantages than he must forthwith find it a grand instrument for national regeneration. We need not speculate for our neighbours—they do that abundantly for themselves; but for this country, much good as we can see in the system of industrial training, we hold that it is advantageous only within limits. It is a good rule *here* at least never to do for the people individually what they can do and may be brought to do for themselves. Independent self-support is the bone and muscle of this great country's greatness. Alas for our fate if there were not a hundred children started in life through the efforts of their parents for every one that is brought up and provided for by charitable or other public institutions! If we were to train up the children of all our working-classes in trades according to government regulations and with national funds, they would soon cease to be that great working class which they now are.

The article on which we have been commenting is extremely interesting, as containing a general view of what has been done by governments for the furtherance of industry in various parts of the world. Schools of design, and those establishments which, by teaching, lectures, libraries, expositions, or the like, give the artisan the means of improving himself, are, we believe, unquestionably advantageous. But the accounts of the result of farther interference and official regulation are not very promising. In Prussia the certificate of capacity which a mason, a joiner, a wheelwright, &c. requires, does not bring him nearly up to the level of the same kind of workman in this country. The author shews that it is in lazy, incapable Italy that most is done by government for the workman. We wonder why so little—nothing at all almost—is done in Holland, that hive of industry: a nation more industrious indeed, as a whole, than our own, since nearly all its people are of the same energetic character as the Saxon race in Britain. But we think the author hardly sees the force of the solution which he himself

suggests—that government intervention to inculcate industry is superseded in a country where every household is an industrial school. We fear it is not in the power of statesmen to supply the want of such a characteristic by government arrangements.

LINES ADDRESSED TO A MINIATURE.

BY A LADY.

Thou knowest not, thou faithful miniature,
The strange delight thy lines to me afford—
Thy mimic features, with their placid mien,
Calm and unmoved, unconscious of my eye!
Here I may gaze and dream, and fear no blame;
This I may love and prize unseen—alone.
How nobly truth and innocence combined
Sit on that brow, and dwell within those eyes!
How sweetly on those closed and manly lips
Firmness and love together hold their sway!
Thy form I see, with strength and courage braced,
Thy glance with all its native energy!

In vain I met, I knew, approved, and loved
Him whose most truthful likeness thou dost bear;
In vain I watched his eye, forestalled his wish,
Welcomed his presence, and his absence mourned:
I learned his flame—I smoothed his path to joy;
My fate was sealed—his love was not for me!

And there is one who drinks from those fond lips
Words of delight and accents of deep love;
Who reads entranced his soul's impassioned vows
From those deep, earnest, and most loving eyes;
On whom his every thought, his every wish
Is fixed, and chill or change shall never know.

And be it so! worthy are ye of bliss!
May Heaven its choicest blessings freely pour,
Strew all your earthly path with fragrant flowers,
And lead to realms of everlasting day!
My heart is rent, my inmost spirit seared,
But prayer and silence shall alone be mine.

I. H. R.

'THE LADIES' GUILD.'

As a pendant to the article on this Association in our last Number, we are now enabled to mention that the Guild is not intended to be confined to Miss Wallace's patent. It will likewise provide an economical but genteel home for lady-artists, wood-engravers, fancy-workers, &c. who in the sale of their productions will enjoy the advantage of the commercial arrangements of the Guild. This extension of the plan adds greatly to the importance of the institution, and justifies the promoters in inviting such persons as will be satisfied, for the sake of the benevolent object, with 3 per cent. interest to assist in forming the small capital required by taking L.5 shares.

VULGAR FESTIVITIES.

It is indeed a sorry business when the British people has it in mind to be festive. As though bewildered at the very thought of twenty-four hours' absolution from toil, the artisan betakes himself to strongest beer to nerve his frame for the contrast, and inspires fumes of blackest tobacco to dim his perception as to the difficulties of his position; and to this beclouded and frenzied condition of their supporters do the caterers of holiday amusement address themselves. In no country in the world is so little art employed, so little invention exerted, such obstinate attachment to worn-out routine, as among our show people. All is coarse, supremely silly, or simply disgusting. There is no genuine mirth, no healthy expansion of the spirits. Riot and low debauchery are its substitutes.—*Times*.

THREE FRENCH RIVERS.

SCOTSMAN-LIKE, I have always had a sort of mystic reverence for celebrated pieces of water, whether rivers, lakes, or seas. It is one of the features of the national character to poetise and symbolise the abstract ideas of our favourite streams. In this respect the Scot is like the Greek—he breathes life and individuality into the features of nature. If he do not create river-gods, fashioning their dreamy forms, and chiselling their never-exhausted urns, he still entertains a dim, yet thoroughly-poetic idea of, so to speak, the sentient individuality of his favourite stream. He collects its natural attributes, whether sternly magnificent or softly beautiful, and with them he endows a mystic, symbolic personage, whose sworn and chivalrous defender he becomes. Scott well knew the tendency, and has frequently alluded to it. 'That's the Forth,' says the Bailie, with that air of reverence which I have observed the Scotch usually pay to their distinguished rivers. Sir Walter himself, who made the Spirit of the Flood speak with the Spirit of the Fell, would assuredly have done valiant battle for any stream between the Cheviots and Cape Wrath; but he would have died the death in honour of his well-loved Tweed. The English have little of this feeling. A few of the poets—Milton and Pope, for example—have individualised and deified the slow-moving waters of the south; but their writings in this respect were but the reflex of classicism. They called up again naiads and water-gods; but the visions were felt to be mere cold poetical conceits—not hearty, nationally-stamped impulses. Some years ago I remember asking a working-man upon Leeds Bridge the name of the slow stream beneath.

'Why, it's the reever,' was the reply.

'Yes; but don't you call it by any name in particular?'

'Not as I ever heard on: anyway, it ain't no business of moin!'

You would never find such thoroughly-stupid boorism north of the Carter Fell. Not a shock-headed loon who dabbles in a moorland burn but would tell you, at all events, the local name of the running water; not a dounce, grave burgher, loitering at Curfew Line on the gray, old brig, beneath which pours, with old and well-timed melody, the fulness of the stream beside which he was born, but would expatiate by the hour on its beauties and its merits: the wildness of its 'spacts,' and the crystal purity of its pools; with a passing legend, perhaps, of some ancient ford, or a smiling but respectful reference to the kelpie who once waded down in the darksome waters of the deep swirling holes, but who has ages ago extinguished for ever 'his candle of death and of dool.'

Smitten, then, with this national instinct of reverence for rivers, I paid, during a recent ramble in France, some attention to the characteristics of its three great rivers—the Loire, the Garonne, and the Rhone—each of which has its own individuality, and boasts its own attributes. The French are unlucky in the navigable qualities of their great rivers. The Seine, though comparatively a small stream, is perhaps the best fitted to be a means of transport; but the genius of the country, which shrinks, cat-like, from water, has prevented any really efficient attempts from being made to overcome the natural obstructions to the passage of boats along the vast courses of the other streams. The Loire is a deceitful river. Calm, and gentle, and softly flowing—swirling on in pleasant streams and smoothly-moving reaches, amid its green meadows, and clustered vineyards, and stretching corn-fields, it can nevertheless come roaring down from bank to brae with all the fury of a Grampian torrent. Its course is strangely tortuous: rising in the wild regions of the Auvergne, amid the extinct volcanoes of that remarkable tract, and as far south as the country of the olive and the mulberry, it sweeps through entire central France, mirroring many an ancient town and laving many a historic château ere it flows by Nantes. The Loire, except in particular spots, is not a pretty river. The bed is two or three times the width of the actual average stream, leaving vast expanses of shingle and sand, and low marshy islands, through which the scanty stream, divided sometimes into a dozen dribbling branches, takes its winding way. The main current is seldom above from four to six feet in depth, and its track changes, with a curious perversity, from side to side of the bed, shifting and winding between islet and sand-bank, sometimes overflowed, and sometimes left dry and whitening in the sun. But the Loire, in flood, is not to be trifled with. The general line of the country through which it passes is low, the valley being wide and shallow, and the adjacent *haughs* rich and flat. At intervals, therefore, huge dikes or dams have been constructed. The work was begun as early as the Valois kings; but the *levées*, as they are called, are continually being broken into; and all along the river, from Roanne in the central south, you see upon bridges and house-walls a deeply-cut arrow-head, marked *crue de 1846*—the memorial of a flood which, from Orleans downwards, laid the valley of the Loire under water.

A voyage up the Loire in one of the sailing-barges which manage to navigate it would be an excellent expedition for a traveller fond of taking his time on the way. These great boats always sail in fleets made fast to each other. They are flat-bottomed, and carry one huge mast, upon which is spread one vast sheet of very

white canvas—only adapted, however, to be displayed when the wind is right astern. If the westerly breeze be strong, the squadron makes comparatively decent way, except in the more rapid streams, in ascending which it is amusing to watch their struggles. Now, perhaps, a rattling gust of wind, which makes all the long rows of soldier-like poplars in the neighbourhood buffet each other lustily, sweeps angrily over the ruffled current; the big sails swell and surge; the long and thin, but well-stayed mast bends and quivers; and up goes the fleet gallantly, flinging the water from their huge square booms. In a moment, however, the force of the gust lulls; the masts straighten from the strain; and the upward motion of the squadron comes to a gentle stop. Sometimes I have watched a fleet motionless for ten minutes in a rapid stream; the force of the current just counterbalanced by the strength of the wind—the boats sometimes gaining a foot or two, at others losing as much—and hours perhaps consumed in the ascent of a few hundred yards. The appearance of these large squadrons in the more softly-flowing reaches of the river is very beautiful. You watch them threading the channels between the labyrinthine wooded islets, the white sails glancing amid the trees, and then perhaps emerging into a broad shallow bend, following from bank to bank the devious channel.

It is between Blois and Angers that the Loire attains its most perfect beauty. There France is really 'la belle.' There the fairest landscapes of the kingdom—combining the freshness of the north with the richness of the south—spread gloriously along the river banks. The corn grows richly as in the Beauce; the apple, luxuriantly as in Normandy; the maize, yellow as in the hottest Pyrenean valley; the grape, luxuriant as in the sunny terraces of the Rhone; and there, too, passed the most picturesque scenes of mediæval France. The Valois kings loved the Loire, and studded Touraine with their châteaux. It was from the castle of Blois—the Windsor of France—that the dark power of the Medici family radiated. It was at Chambord—the finest specimen of the antique château between the North Sea and the Mediterranean—that the easy-going Francis I. caroused; and you may still see the mouldering stones of Plessis-les-Tours, where Louis XI. plotted with Oliver le Mauvais, and gossipped with Tristan l'Hermite. Here, again, at Chinon—a paradise of vines, and groves, and softly-flowing waters—Joan of Arc broke in on the easy revelry of the seventh Charles. Diana of Poitiers is for ever associated with the halls where her emblematic crescent still glitters. And this, too, was the country of the gentle Agnes Sorrel. Again, what a glorious bead-roll of ancient towns stud this delicious land: Blois, in all its mediæval picturesqueness; Tours, redolent of Louis XI. and his Scottish archer-guard; Amboise, a model of the town called into existence by the feudal fortress; Saumur, an old Protestant stronghold; Angers, from whence came our own Plantagenet kings—more antique-looking than even Blois; and Nantes, the thriving capital of Brittany.

• Turn to the Garonne, and we leave all such deeply-interesting historical associations behind us. The great river of Gascony rolls a rapid pea-soup-coloured flood along a course curiously destitute of general interest, except perhaps such as may be derived high up in its course from recollections of the Albigenses, and in more modern days from the struggle at Toulouse between Wellington and Soult. In the plains watered by the Garonne, however, the 'gai science' originated. Languedoc and Gascony sent forth the first of the minstrels and troubadours. The tongue in which the *serventes* and *lais* chanted by these wandering gentlemen were written, still exists in the common patois of the peasantry; and the race of which Blondell was a member is not yet extinct. The last of the trouba-

dours—one Jasmin, a barber, and a man of high poetic abilities—yet dwells at Agen, on the Garonne, and yet sings ditties similar in spirit to those which Cœur-de-Lion proposed to chant—"in oc or in oui"—to the holy clerk of Copmanhurst; when that reverend personage indignantly preferred a good old English ballad to all the 'ocs and ouis of France.'

There is little traffic on the Garonne, with the exception of the reaches above Bordeaux, up and down which boats laden with country productions for the city's use ply incessantly. It is a sight, early on an autumnal morning, to see these arks, laden to the water's edge with piled-up masses of grapes, plums, and melons, disembarking their contents above the great stone-bridge of Bordeaux. The air is sickly with the fragrance, and the shore an absolute chaos of massed and heaped-up luscious fruit. The valley of the Garonne, however, with all its actual riches, looks poor and bleak. The river often winds between bare chalk cliffs, pouring a yellow, muddy flood from side to side of its piled and built-up banks; the villages are dead and dreary-looking places, mouldering and crumbling to decay; but the populousness of the country is shown in the vast number of wire suspension-bridges which span the stream. At a distance these structures look very commanding; but a close inspection shews how weakly and how coarsely they are built. The diligences crawl cautiously along them, amid such a storm of cracking and creaking, that I was often well pleased when we turned our backs upon the river. It is far up the stream, however—about the roots of the Pyrenees—that the Garonne shews its best points. At Bordeaux it is half water and half yellow mud, but still flowing with a strong and sweeping current. Higher up towards Agen and Toulouse, it is a dull drummy stream—often in the summer-time leaving great expanses of shingle bare, and broken here and there into futile rapids by the projection of shelves of rock across the bed. But issuing from the boxwood-covered gorges of the Pyrenees, the Garonne is a glorious Alpine stream, plunging on its way in foaming, whirling eddies, amid masses of disjointed rocks, swirling round and round in clear, deep, rippling pools, or bickering over the slimy shingle with a gay, popping sound—pleasant green *haughs* upon the banks, and gowan-covered knolls, and many a ragged mountain-urchin 'paulding in the burn.'

So far as volume of water goes, the Rhone is undoubtedly the queen of French rivers. The Seine goes sleepily and dreamingly along; the Loire, when not in flood, murmurs musically from island to island, and steals tranquilly by the shingle whitening in the sun; the Garonne, by the time its tributaries have converted it into a first-class river, is only rapid and fierce at certain points; but the Rhone throughout its course, from Geneva to the muddy Delta in which it loses itself and oozes into the Mediterranean, is a wild, turbulent, headlong river, driving down in breathless haste and majestic force towards the sea. The stream is therefore held in very great awe by the dwellers on its shores. A sudden melting of the snow upon the Swiss hills is a matter of very serious import to the bank towns, from Arles upwards; and I have been more than once struck by the anxious faces watching the mighty rush of the impetuous flood when the river was considerably higher than its ordinary level. The Rhone alone of the French streams still boasts a few bridges of boats upon the common German plan. There are other ancient structures of stone, the shooting of which—particularly of one at Pont St Esprit—was a feat in the days of old. It was on the Rhone at Tournon—a place close to the celebrated Hermitage Vineyards—that the first French suspension-bridge was erected; and since then they have multiplied rapidly—in general, however, the same flimsy, unfinished-looking structures so common on the Garonne.

As may be guessed, the Rhone shews little favour to barge navigators. It is a capital stream to float a vessel down with; but *revoquer gradus* is the difficulty. Many barges are despatched from Lyons and the higher towns towards Avignon and the Delta, laden with merchandise, which is disembarked at its destination, and the boat—a rude, ill-put-together affair—broken up for firewood. This is generally the case with the coal-barges floated down from the mining country below Lyons. Other vessels, however, achieve the upward passage; but their number is fast diminishing, as steam is making its way upon the river. The Rhone barges, like those of the Loire, sail in fleets, but never make use of canvas. A whole troop of track-cavalry tugs each lumbering squadron. Three or four barges, fastened to each other, are often dragged by thirty or forty horses, scrambling on the banks, plunging into the water, often dragged off their legs as the desperate eddies and flows of current wrench round the boats with irresistible force. The voyage of an amphibious caravan of this sort, from Beaucaire to Lyons, used frequently to occupy from six weeks to two months, and the squadron was lucky which made the passage without the loss of two or three of its horses. The labour these poor beasts undergo soon breaks them up, even if they escape being dragged into the river and drowned in their harness. The upward navigation of the Rhone, indeed, without steam aid, was mere wanton folly; and accordingly the vast mass of the products of the south, and the 'denrées coloniales' which every country grocer in France paints over his shop-door, are brought northward in great caravans of carts and wagons, which daily and nightly, at every hour of the twenty-four, toil monotonously along eternally the up-and-down and dusty glaring road.

The Rhone scenery in some degree resembles that of the Rhine; but it is far tamer, and less varied. Like the Rhine, the French river loses itself in divers branches in a flat and marshy country—forming towards the mouth of the Delta a dreary expanse of rice-swamps and salt-morasses—burned up by an almost tropically-powerful sun—continually overspread with dark night-mists, and haunted by perpetual fever. Higher up, the Rhone passes through the dry, parched olive country, amid stony tracts of brown, gravelly hills. This applies to the district about Arles and Beaucaire. Ascending to Avignon, and beyond it to Valence, we get into the mulberry district—the olives and the almonds disappearing, and the more stately timber of Midland France taking their places, with the vine everywhere. It is above Valence, however, that the characteristic features of the river appear. During a long summer day, you steam windingly between two unbroken ranges of brown, undulating hills, vineyards from the water's edge to the summit. The quantity of the fruit cultivated is surprising. On and on for scores of miles, between two enormous screens of vines, every square inch of the mountain-side terraced and cultivated, as if the soil were the last left of the world. Here and there, upon a rocky peak, towers the gray and Rhine-like feudal chateau, generally in ruins. Along the river's bank extends the long, straggling, brown-burnt village, and a far-stretching line of flying dust, streaking with white the green expanses of the vines, indicates the track of the road on either bank. Between these the Rhone rushes in the fierce, sullen majesty of its might—the idea suggested by the river being always one of power and strength, never of grace or beauty.

There are certain features which appertain to all French streams, big and little: the clumsiness and apparent frailty of the barges used, for instance—the rickety and miserable look of the smaller boats, generally mere flat boxes, rowed with machinery like wooden spades—all speak of the anti-aquatic habits of the people. On the seacoast they learn to build ships

as well as other nations; but up the country they never take kindly to the water, or aught that concerns it. You never see in a French river-town anything like the pleasure-wherry—the smart gig and funnies which in England would be floating on the water by the score. The punts employed are used for purely business purposes—Paris, which is a miniature representation of all Europe, and as such having borrowed some of our English customs, being the only exception to the general rule. On the Seine there are a few *canots*—the pale reflexes of London—four, six, and eight-oared galleys; but at Lyons, for example, on the Rhone, at Macon on the Saone, at Bordeaux on the Garonne, and at Tours, Orleans, Saumur, and so forth, on the Loire, I never saw the ghost of a pleasure-skiff, or heard that the rivers were ever used as a means of recreation and wholesome exercise, except in swimming. The barges, again, are frequently very large, but very flimsily built, and generally unpainted. They have a family-likeness on all rivers, particularly in the extraordinary awkwardness of the machinery with which they are steered—the tiller often consisting of a vast beam of wood, weighing more than a ton, one end of it flattened and widened by means of nailed boards attached, the other running as far forwards as the mast. The steersman reaches it by means of a platform, and the whole mass is poised upon the stern. The washing establishments form another French river feature. In summer they seem all very well—bating the rude usage which the linen appears always to be subjected to; but in winter it makes one shudder to see the bands of women, with their bare arms up to the elbows in the icy stream. A *blanchisseuse* has probably no very pleasant life of it in any country, but the French sisterhood must undoubtedly be amongst the greatest victims. In England such operations are usually conducted by the side of comfortable stoves and steaming-coppers; but certainly our neighbours, with all their reverence for Napoleon, pay but little attention to the literal interpretation at least of one of his most noted maxims—*'Lavons notre linge sale en famille.'*

LYDIA, THE FOOLAH SLAVE.

In cruising along the western shores of Africa, we touched at Freetown, the principal settlement of Sierra Leone. This is a colony of liberty and of death: giving freedom and all its blessings to a vast number of enslaved Africans, whilst the noxious climate has made it proverbially 'the white man's grave.' At the end of December the weather was charming; for although the thermometer ranged high there was a cool breeze from the sea, and the air was balmy and elastic, imparting a cheerful vigour to the animal and mental frames. I could scarcely imagine that a few months previously the yellow fever had made such dreadful ravages, or that in a few months later most of the European inhabitants would be suffering from debility or fever from the hot vapours of the rainy season and the miasma which arises from putrid vegetation.

Freetown itself is an interesting place, well situated on a rising-ground near the river, with a high hill at its back. It contains more than 16,000 inhabitants, of whom 300 or 400 are Europeans, the rest are mulattoes and free blacks. The negroes are of a great variety of tribes, forming a miniature representation of the nations and languages of Central Africa. Under the fostering care of European missionaries and schoolmasters, many of the coloured population have acquired the rudiments of knowledge, and are become industrious, intelligent, and well-behaved. The contrast between this settlement and any native town in

its natural rudeness is so marked as to be highly pleasing to the friends of Africa, and I could scarcely regret the valuable lives which have been sacrificed in producing this oasis of a desert continent—this refuge from slavery and barbarism in a blighted land. Free-town is surrounded with about twenty small towns and villages, in which nearly 40,000 liberated slaves are settled under care of the British government. Each has his own plot of ground, on which he erects his hut, and uses as a yard or garden according to his convenience.

As I was strolling through one of these towns, looking about with prying curiosity to see African manners improved by civilisation, I was accosted by an intelligent woman, of comely appearance, and of a lighter complexion than I had supposed to belong to the negro race. She was neatly dressed in native costume, having a garment thrown elegantly round her breast and shoulders, whilst another covered the lower part of the body: she wore European shoes, and had her hair fastened with a pretty handkerchief. She spoke broken English in a fluent manner, her language shewing that she was accustomed to read. After a few minutes' conversation, she invited me into her dwelling to take a seat, and refresh myself with a drink of milk. The hut which I entered was of superior workmanship, consisting of two apartments, besides outhouses, and containing some articles of good furniture: it was quite as neat and comfortable as an ordinary cottage in England, though necessarily in a lighter style. Two or three fine children, not so fair in skin as their mother, were playing about the door, clothed in a simple shirt or frock—quite enough for this warm climate. Her husband had gone out to look after some cattle. After various questions, which she answered with readiness, she yielded to my importunate request for a short narrative of her eventful life, which she gave to the following effect:—

I belong to one of the Foola tribes who dwell in the interior of this country. The pastoral Foola have whiter skins than the other negroes: my husband is a Fencolar, speaking the same language, but of a darker colour. I remember nothing of my earliest childhood, and was never told about it by any person; nor do I know where my parents lived, nor where I was born. I have a faint recollection of dwelling in a village, composed of wattled huts, and surrounded with a stockade: it had one broad street in the middle, with cane-houses on either side, each in a little plot or garden. I played about all day with my infant brother and other children of our tribe: we did not wear any clothes, for these are not used by children in Africa. My father and his people—for he was head man of the town—used to keep cattle, and were obliged to take them in the dry weather wherever pasturage could be obtained. This is all I remember of my first home. We were never allowed to go out of the town by ourselves, lest we should be stolen by men or devoured by wild beasts. So we lived in safety though not in peace; for in Africa there is nothing sure save the vast forests, the desert sands, and the mighty rivers: these must always remain—but man has no quiet there. We are in constant fear of enemies, and we never know when to expect a foe. We are like a canoe in the water when the paddles are lost and a strong wind is blowing—we are like the chickens when the screaming hawks are flying over our heads—like the bleating goats when the howling wolves surround the fold.

Our stockade kept out the wild beasts at night, but it could not save us from the attack of wild men, for in poor Africa there is little in our houses which the wicked can steal; so they come to rob us of liberty and all we hold dear in life. We never grudged paying the Mandingoes for keeping us safe; and though their chiefs often imposed upon us, and asked many presents, we did not complain.

We were one night sweetly asleep as usual, the children lying on a wicker-frame at one side of the hut, and our parents occupying another on the opposite side. We were as birds in a nest, for our tribe was at peace with all around, and we paid a tribute to the king in whose country we sojourned. At midnight we were awakened by a great shout, and I felt much frightened, for I had never heard so loud a noise except from the thunder of heaven. It grew louder and louder like a mighty tornado crashing the trees, and sweeping everything before the terrible blast. Men's voices were now heard, and my father seized two spears which stood against the hut, and ran out. My mother was just following when we heard a loud noise of guns, and all was for a moment silent, like the still calm which prevails before a tempest blows. Then my mother ran in shrieking, and seizing us children, threw us under the bed and spread the clothes over, telling us to be quite quiet whoever might come in. We lay there in trembling suspense for a few minutes, when she again hurried us out; and we saw a great light as if all the town was on fire. The roof of our own house was burning, and we ran out to escape the flames. Near the door I saw the body of my father, covered with blood, his hands still grasping the spears. I called him to rise and come away with us, but he returned no answer; and my mother hurried us into the middle of the street. We there found ourselves surrounded by savage men, who bade us keep together, and then drove us like a flock of goats out of the burning town. There I saw all our cattle collected, and the women and the children of our tribe, and a few of the young men with their hands tied behind them; but we had passed by many dead bodies.

As soon as it began to be light we were driven into the forest, and made to go very fast, never stopping till the sun was quite high. When any of the children were tired and could not walk farther, they were given to the women to be carried. Some of these were old, and were themselves feeble, and they did not care to go into slavery; so they refused to go forward. They were then beaten, and if they still refused they were pierced with a spear, and left to be devoured by the hyenas and wolves which followed at a distance, for they know the track of the man-hunter. The bloody vultures also screamed over our heads, and I have been told that they often fight with the beasts for the bodies of the slain. At last we were all tired with walking and with the sun, and faint with hunger and thirst. We reached a river which we crossed, and sat down under the trees of the opposite bank, for the men could there see if any one was pursuing them. At last they judged that all was safe, especially as they were now far in another king's country, who was friendly to some of themselves. When the coffee had rested and our captors had satisfied their hunger—for we had nothing to eat, only they gave the children a little milk—it was then agreed partly to divide the spoil. Some of the men-hunters were quite strange to us, speaking a language we did not understand, and having come from a great

distance; but others were wicked men who lived in a country not far from our own, and who had joined the hunters and led them to our unhappy town for a booty. The women with their infants, and the young men and older children, were taken by the strangers, because they could travel, and it was needful that they should remove far away from their homes, lest they should find means of escape from bondage; but the little children who could not walk far, and who were heavy to carry, and who were not likely to know anything of the country, were given with most of the cattle to the hunters who lived in the neighbourhood. In this division I was separated from my mother and my little brother, whom she carried on her back. My mother begged hard to have me with her, and cried and tore her hair; but they forced her away, threatening to take her infant if she would not be quiet. She then desisted, and covering me with kisses, she wrung her hands in anguish, and bade me a long farewell. There were gloomy prospects before us all, but we only knew a part of our woe: we were like a sheep which mourns for her lambs that are killed, but does not know the fate which soon awaits herself.

Next day the party who had us for their prey reached their own town, and made a feast because of their success. The cattle and children were indiscriminately divided amongst the robbers, and my master went home exulting with two little slaves and many head of cattle. We were well used, and had little to complain of, in our childish forgetfulness of the past and ignorance of the future. The women who belonged to my master—for he had several wives—tilled the ground and prepared the food, and they were kind to us in our orphan condition; but I could never look at my owner save with feelings of horror, for visions of the bloody deed which he had done followed me by day and haunted me by night. It was too terrible a scene to pass away from my memory; and when I heard the other children calling "father" and "mother," I felt angry at him who had deprived me of both.

After a time my slave-companion was parted from me, being sold to a dealer who came round the neighbourhood. My master received in exchange some rum and tobacco. He would have sold me at the same time, but his chief wife wanted me to take care of her baby. After some years, when I was beginning to grow tall, she sent me into the field, for she claimed me as her slave, and I always obeyed her orders. Field-work was harder than that in the house, but I was not displeased to be away from my master, whom I could not bear to look upon; besides, he was a passionate man, often drunk, and then his fury was ungovernable, till they stupefied him with liquor, in which state he would lie for days together. On one occasion when he was absent a Moor passed by, and my mistress called me and shewed me to him. He examined me all over very attentively, looked pleasantly at me, and afterwards had a conversation with her on the subject. She then gave me to understand that the Moor had offered a good price for me at the end of six months, provided I then looked well and plump. She praised my beauty, and said that I should go to live with the Moor, but that I must take care to answer his expectations. For this purpose I was brought from working in the fields, was well fed, and had to drink a large quantity of camel's milk each morning. Thus, sir, we are treated like the cattle: like them we are bought and sold, and like them we are gorged with food when it answers our owner's purpose.

The time fixed upon was fast approaching, but I looked forward to it with far less interest than did my mistress. She was expecting my price in a quantity of necklaces, bracelets, and a fine shawl, which the

Moor had promised to give for me if I were in good condition, and she spoke much about the hoped-for finery. I cared little about the matter, feeling no interest in the barter; whether I were a slave or a slave-wife made little difference, and would scarcely alter my condition of servitude. My thoughts were very limited, and provided I should be well treated and have plenty to eat, I little cared where I was or to whom I belonged. I had no idea of a soul or of a future state, but regarded myself as one of the cattle—only having a more beautiful structure of body than they. I knew more than the cows, but not more than the ants and bees, and the sagacious elephant. What I heard of these creatures often made me wish that I was as free and as wise as they seemed to be. I lived for to-day, heedless of to-morrow, and nothing but my daily employment had ever exercised my mind. My master never prayed, for he was a Soninke or drunken infidel, and knew not God. We had dances at particular times of the year, and some of the people made offerings to idols, and we wore gregrees or amulets to keep away danger and disease; but we knew no more. The Moors, however, have a sacred book, and some of the negro nations worship Allah as they do; but this is for the men, not for the women.

The expectations of my mistress turned out like other African hopes—they were written on sand, which is scattered by a sudden whirlwind. One day while I was weaving cloth beside her, we were surprised by a small party of horsemen who dashed into the yard. All the men of the place were absent, which these freebooters had ascertained by their spies. They instantly seized us and as many more women as they could find, each taking up one upon his horse, and rode off at full gallop. It was the work of a moment, and we were all carried away—my mistress, her child, and the other wives, sharing in the same captivity with their slaves. In Africa a man may be great to-day and very little to-morrow, and he that plundered his neighbour's house yesterday may have his own home broken up next morning. When my master came home from looking after the cattle which he had stolen he would find his huts desolate, and might have no information about the robbers—only that they were Moors.

The sufferings connected with this second captivity were severe, but short compared with those endured by other Africans. After riding for a short time at great speed through the forest, and finding there was no pursuit, our captors dismounted their victims, and forming us into a group, they drove us like a herd of cattle at a rapid pace. If any one began to lag behind a rope was tied about her neck, and she was dragged and goaded forward to keep up with the rest. We travelled hard for two days toward the south, when we reached a town where they traffic in slaves, and there the dealers soon purchased us of the Moors. The slave-merchants into whose hands we had now fallen were expecting a cofle toward the western coast, where a small vessel was lying in a creek of the Rio Grande waiting for a cargo. This circumstance saved me much bodily torment, which must have been caused by a long journey to the Gold Coast, and by the inflictions of a tedious voyage. The place of our embarkation was a hazardous one for the trade, being so near the British settlements; but it was attended with many advantages if the slaver could only get clear of the coast: it was a short but dangerous enterprise. We were detained for a few days at the water-side, waiting until an expected cruiser had passed by the mouth of the river; then we were huddled at night into a small slaver, which immediately set sail. But who can describe our wretchedness during the next two days—being cooped up between decks, unable to sit upright, or even to change our posture, and nearly suffocated for want of air? A light wind had driven the slaver from the shore, and then left her becalmed in sight of land. This added to our sufferings; since

there was no ventilation in the ship's hold, and though we were perfectly naked the heat was intolerable. To keep us alive we were released for a few hours in the morning, and sent to take air on the deck. The sight of Africa's mountains, and gloomy anticipations of what might yet befall us at sea and in distant lands, filled us with melancholy; but we were almost past feeling through fatigue and exhaustion. Perhaps I was as heedless of my fate as any on board, as I had not left behind any one for whom I cared. The only being in whom I had felt interested for many years was my mistress's daughter, who had been taken sick on the road, and was left by the Moors to be devoured by the wild beasts.

While looking over the side of the vessel at the huge sharks which swam around us, as if waiting for the body of some dead negro to be thrown overboard—for these fish are said to know and follow the slave-ships—I was struck with the appearance of a dark object coming towards us: it looked like a ship, but it had no sails, and I could not tell how it moved. It seemed to have a short, thick mast in the middle, out of which a black smoke issued in a long stream. It came forward without oars or sail. We all wondered; but the captain and sailors were greatly alarmed. They looked at it through a long tube, and then consulted together. At first they thought of throwing us all overboard, and even came to lay hold upon us for that purpose; but we shrieked and struggled, and as we had no clothes to hold us by, they soon found it would be too long a work, especially as there was an under-deck full of male slaves still below. Meanwhile the flying-ship was coming quickly down upon us, so the seamen lowered two little boats, and jumping in, rowed with all their strength towards the shore, which they soon reached, and disappeared in one of the creeks. The steamboat, as I have since heard it called, came close alongside. She was full of men, who had swords and pistols; others stood with matches in their hands ready to fire their great guns, with which I am told they can sink a vessel much larger than the slave. Several finely-dressed men leaped on board, but finding that all the crew were gone, they put up their swords and spoke kindly to us, telling one of their black sailors to inform us in the Mandingo language that we were all free, and would soon again be set ashore on Africa. The fetters of the male slaves were knocked off, food was given us, and we had as much water as we could drink, for we were parched with thirst.

In a very short time—for white men do things very quickly—all was got ready for sailing. A large rope was fastened from the steamboat to our ship, which was dragged through the water to Sierra Leone. You cannot think of our wonder and joy, our surprise and delight. It was like a dream; but I had never dreamed anything half so astonishing. To be delivered in a moment from slavery and sorrow; to be on the way back to Africa; and all this to be done by a ship which went without sails, which swam with fins like a fish, and belched smoke and fire from its mast! I knew not where I was, nor whether my head or feet were uppermost. At sunset of next day we reached Sierra Leone, and my surprise was increased by the sight of the place. Such large houses appeared at a short distance!—such fine soldiers came down to the sea!—such finely-dressed men and women, white and black, walked about! Many black people came to look at us, and to see if they had any friend among us; and all spoke to us kind and pleasant words.

When we had been taken to the King's Yard, and been washed and dressed, some people came to take apprentices, and among others the man who is now my husband. He is a Foolah, but not of the same tribe as myself: he was once a slave, but had now been several years in the colony, and having worked hard he had raised himself to respectability. Perceiving my

fair skin he spoke to me in my language, and upon receiving an answer he asked me how I had been captured. I told him the chief events of my history. When I had finished he immediately went and spoke about me to the government officer, and then took me to his house, where he and his wife treated me kindly. They remembered that they too had been slaves and strangers in a foreign land, and they pitied me, for they were good people. My mistress was young, but she was sickly, and she had an infant which she wished me to take care of. I was also to help her in all matters about the house, which was easy employment. She was a very sweet woman, and I soon loved her much: she treated me more as a companion than a servant, and I was never so happy as in fulfilling her wishes.

A few days after I arrived was the Sabbath. I was surprised that the people did no work on that day, but all dressed themselves in their best clothes, and when a bell rang they went to a large house like a store-room, but much larger and finer. They told me it was called a church, where they sang and prayed, and heard a minister preach to them out of a great book about God, and their souls, and a future life. All this was new to me. I wondered at what I saw and heard, but could understand nothing. My mistress, who was herself a Foolah, kindly explained to me about the Bible, the book which God has given to the white man. It filled me with much wonder, and I could not rest till I understood these great truths. It was the first time I had really thought about anything that deserved attention, and I was glad to find that I had a mind to think and a heart to feel. Eventually I was baptized by the name of Lydia, and became a happy member of the Christian church, being now able to speak a little English, and to understand something of what the minister said.

My sweet mistress continued sick for two years; and though we had a white doctor to attend her, she grew worse, and died. It was a time of great trouble to us all, and to none more than to myself. I loved her very much, even as my own soul; for she was always kind to me, and had taught me much that was good. She died in the faith; and I have often thought that if ever there was one on earth who was prepared by gentleness, purity, and peace, for a holy heaven, it was my dear mistress.

When my apprenticeship was nearly finished I had grown to womanhood, and was now tall and comely. Two or three young men were making proposals of marriage, which my master said should be entirely left to my own choice; only he advised me not to be in a hurry in coming to a decision, for I should easily get a good husband, and now I had a comfortable home. He had not taken another wife, and there was nobody who loved his child as I did, so I said that I would remain with him as long as he pleased. One day he brought home a new dress, which he told me to put on; he said that I looked very nice in it, and I replied that it was too fine for a servant. He said that he wished me to go with him to a wedding the next week, and that I must be dressed for the occasion. Upon my asking who was going to be married, he said that it was himself, and that he hoped to have me for a wife. Such a thought had never entered my head, and I was quite perplexed; but the result was that I became his happy bride. Since then my life has been as peaceful as a flowing river on a fine morning. It has always been the dry season in our house—no rains, no tornadoes of sorrow, have ever troubled our dwelling. We negroes are naturally a quiet race, and the Foolahs are timid and gentle; and when religion makes a Foolah's heart right, filling it with love to God and man, it is as peaceful as the blue sky—as happy as the pretty birds which fly about the bushes. My youthful sorrows are almost forgotten, except to contrast them with my present blessedness, and to thank God and the English for this colony of Sierra Leone. This is a hill on which

we live when the floods arise and cover the ground; it is a house of stone when the fierce tornado blows and destroys the huts; it is the shadow of a large tree when the sun smites the earth with his strong heat.

GOETHE'S TASSO.

It has been remarked by Mr R. P. Gillies, that Tasso's records of his own unhappy existence are far more interesting and romantic than the most elaborate of his poems, although the said records are only the chronicle of his wayward caprices and miseries. 'The scene only changes from the palace or convent to the prison vaults, and the vicissitudes of feeling are from the dazzling illusions of hope to the dark, heavy clouds of despondency.*' The minstrel—now dwelling in kings' houses, now pining in durance vile—was he who sang 'Jerusalem Delivered,' who in palace and prison could see farther and feel more deeply than his fellows: like his own hero—

'Molto egli oprò col senno e con la mano,
Molto soffrì nel glorioso acquisto.'†

Stone walls and iron bars could not indeed exclude the vision and the faculty divine, but they could stifle and distort the poet's aspirations—they could bruise and batter the wings of this poor struggling 'bird of paradise.' For, as Byron has it—‡

—'Form'd of far too penetrable stuff,
These birds of paradise but long to flee
Back to their native mansion; soon they find
Earth's mist with their pure pinions not agree,
And die, or are degraded.'

The pilgrim in Italy, as he paces the dull, deserted thoroughfares of Ferrara, looks up wistfully at the grated windows of St Anna's Hospital, and bethinks him of a time when at one of those windows might be seen, day after day, the earnest, pallid face of Torquato Tasso, peering anxiously through the bars—'a face handsome, but extremely sad, rather past middle life, but haggard beyond its age; the hair, though partially white, falling down in delicate curls from the high and somewhat wrinkled forehead; the cheeks pale and ghastly, as of one just recovering from severe illness; thin lips, anxiously parted from one another, and showing the white teeth set; eyes preternaturally bright, and fixed with an intense gaze down the street.'§ Tasso's situation under the duke's lock and key was, as Shelley observes, widely different from that of any persecuted being of the present day; for from the depth of dungeons, public opinion might now at length be awakened to an echo that would startle the oppressor; but then there was no hope.||

To represent in a dramatic poem—for such, rather than a drama, is Goethe's 'Tasso'—this 'victor unsurpassed in modern song,' on whose name attend 'the tears and praises of all time,' was a task worthy of Germany's chiefest bard. The action of the piece is comprised within some dozen hours; but, as Miss Swanwick remarks,¶ by skilfully availing himself of retrospect and anticipation, Goethe has presented us with a beautiful epitome of the poet's life. The period is that signalised by the completion of his great epic—a work which has elevated him, says Sismondi,** perhaps above all modern poets. (The *peut-être* in the Frenchman's criticism is of infinite importance, in the ears at least of the countrymen of Shakspeare and Milton.) We see him a guest of Duke Alphonso, in the beautiful retreat of Belriguardo, where Petrarch was entertained

and Ariosto found his models. He is surrounded with objects from which a happier temperament might have extracted the means of tranquil happiness. Not yet has Alphonso bound him fast in misery and iron, or done ought to merit the indignant denunciation of Childe Harold; not yet had occurred that *hegira* of the distracted minstrel from Ferrara to Sorrento, when, disguised in shepherd's garb, he told his own tale so touchingly to Cornelia, that the fond sister fainted with grief; not yet had he known imprisonment in the hospital of St Anna; not yet wandered to and fro, honoured indeed, but miserable, seeking rest and finding none. But for all these sorrows Goethe prepares us. He reveals the forecast shadow of coming events. The cloud may be no bigger than a man's hand, but it is there: it is dark, lowering, grimly foreboding; and with the fifth act the rustling of its heavy drops is heard, and we feel that the storm is begun.

That Goethe has drawn a faithful portrait of this sensitive, irritable, melancholy genius, so far as actual history rather than ideal art is concerned, appears undeniable. For instance, in one of Alphonso's descriptions—

'Thus to secure my favour, he betrays,
At times, unseemly ardour; against some
Who, I am well assured, are not his foes
He cherishes suspicion; if by chance
A letter go astray, a hireling leave
His service, or a paper be mislaid,
He sees deception, treachery, and fraud
Working insidiously to sap his peace.'*

So in Leonora's remonstrance—

'And oh, dear friend, that Heaven would grant me this—
To make it clear to thee ere thou departest,
That in thy fatherland there is not one
Pursues thee, hates, or covertly molests.
Thou art deceived! and as for others' pleasure
Thou'rt wont to practise thine inventive art,
So in this case thou wear'st a cunning web
To blind thyself, the which to rend asunder
I'll do mine utmost, that with vision clear
Thou may'st pursue life's glad career untrammell'd.'

Tasso's love for the princess is fervently told. Her he glorifies in every strain. Now exalting her to the starry heavens—now stealing after her through silent fields, hallowing her every movement, blessing the music of her every footfall—

'His loved ideal from the spheres he brings,
And doth invest it with the name *she* bears.'

When, in the palace gardens, she takes the laurel crown from Virgil's bust and places it on Tasso's bending head—an emblem of the crown that awaits him in the capital—he quivers beneath its gentle pressure, as though it were a sunbeam on his brain, scorching up the power of thought.

'Whatever in his song doth reach the heart
And find an echo there, he owes to one,
And one alone,'

to whom he passionately consecrates, once and for ever, his whole being.

Tasso's first appearance on the scene is with the completed epic in his hand, which he comes to present to his patron, who receives it with graceful compliments. His happiness for the moment is exuberant—happiness such as poet's electric blood alone can so intensely feel and so swiftly lose. Antonio enters; and lo! Paradise Lost! Antonio is the hard-headed practical man of the world—sage, deliberate, politic, courteous, conventional, and his *entrée* is as through a nightmare of materialism—

'Monstrum horrendum, informe, ingens, cui lumen
ademptum,'

* Miss Swanwick's translation.

had come to perch its intolerable weight on the breast of the transcendental dreamer. Antonio and Tasso cannot hunt in couples. They agree together much as do flint and steel—the result is sparks of discord. Tasso can admire the secretary, just as Coleridge admired men of business, for capacities wherein he felt himself signally deficient: he calls his conversation instructive, and his words ‘how useful in a thousand instances!’

‘For he possesses, I may truly say,
All that in me is wanting. But, alas!
When round his cradle all the gods assembled
To bring their gifts, the Graces were not there;
And he who lacks what these fair powers impart,
May much possess and much communicate,
But on his bosom we can ne’er repose!’—

any more than Shelley could have nestled in that of Jeremy Bentham. Tasso tries to like him, but the two can never be placed cordially *en rapport*; their constrained and evanescent alliance has no claim to a section in ‘Elective Affinities.’ The third scene of the second act opens with an interchange of ‘everything that pretty is’ between the poet and the politician, and ends with poor Tasso in an attitude, flourishing his sword, and trying to provoke his self-collected companion to get up a ‘scene.’ Alas for Tasso’s sensations when Alphonso enters, just in time to behold his martial pose *plastique*! while Messer Antonio serenely says:

‘Calm and unmoved, oh prince, thou find’st me here
Before a man whom passion’s rage hath seized.’

The consequence of the broil is ‘brief confinement’ for the excited poet—a sentence mildly passed by Alphonso, but overfraught with shame and bitterness to the subject of it, still writhing under the recollection of Antonio’s ‘formal wisdom’ and proud assumption of magisterial superiority, which Tasso is not yet old or wise enough to answer with a patient smile. Later in the play, Leonora, anxious to heal the breach, assures Tasso—

‘Yet often with respect he [Antonio] speaks of thee:’

whereto the fretting captive makes reply:

‘Thou meanest with forbearance, prudent, subtle.
’Tis that annoys me; for he knows to use
Language so smooth and so conditional,
That seeming praise from him is actual blame.’

The psychological truth involved in this state of mind is developed with considerable power, and illustrates Goethe’s mastery of the heart of man. Tasso is the ‘hero’ of this drama *de jure* only, *not de facto*; now and then our feeling towards him oscillates between impatience and compassion. He is not to be measured by the standard applicable to sound nerves and world-hardened, world-bronzed constitutions. He is one of those anomalies that abound in the domains of genius—who are a law unto themselves—jealous over their own insular rights—tempest-tossed by every aggression *ab extra*—misapprehending well-intentioned vulgarities, and by them also misapprehended—denouncing the coldness and coarseness of society, but only to heap coals of fire on their own head. In Goethe’s ‘Tasso’ we see a noble, tender, morbidly-susceptible man, whose ill-guided ‘subjectivity’ implicates him in continual bewilderment, creates for his annoyance a recurring series of troubles, and reduces him to strange passes and sorry degradation. We witness the incipient stages of that mysterious madness, the real nature and extent of which is still among the unsolved problems of biography, the unsettled curiosities of literature. We watch the progress of that unhappy love which, in the words of Charles Knight, ‘swayed his whole destiny, and made him the wayward, restless, self-abandoned, and most unhappy slave of presumptuous hopes, of

bitter regrets, of agonising remembrances, of superstitious paroxysms.’* We see the abrupt awakening of his visionary spirit from the halcyon calm of dream-land to the harsh realities of a world where dreaming is illicit, and where dreamers are liable to be prosecuted as the law directs. Deficient the drama undoubtedly is in many important particulars, but the character of Tasso is portrayed with a vigour, animation, and *vraisemblance* that deserve and will repay study. As such we commend it to the reader; little disposed as we are to call the old man of Weimar our *Magnus Apollo*, or to understand the sanity of those who would put him ‘far north’ of Shakespeare’s self—that bright particular star which dwells apart from and above the whole constellation of Germany’s dramatic genius.

THE NEW LAND SYSTEM.

OUR attention has been specially drawn to a work entitled the ‘Irish Land Question,’ in which it is alleged that the author, Vincent Scully, Q. C., has at length shewn the true principles on which the tenure of land should be settled. We have read Mr Scully’s production, however, and it does not appear to our mind that the author has at all set at rest this vexed question, but rather mystified it by new and impracticable views.

What is the actual condition of land-tenure in Ireland? ‘For some centuries past, and up to the present time,’ says Mr Scully, ‘the great mass of those who till the Irish soil have possessed no permanent interest in its improvement; being mere yearly tenants, liable to be dispossessed at any time upon receiving a short notice, and therefore in a state of most absolute dependence upon their landlords. And the great misfortune arising from the existing law is, that it holds out no sufficient encouragements to induce either the landlord or the tenant to unite in converting this uncertain yearly tenancy into a certain and permanent tenure, but, on the contrary, creates some serious embarrassments impeding such a conversion.’ Are we to understand from this explanation that there is a law in Ireland to prevent landlords granting leases for a determinate series of years? We do not believe that there is any such legal restriction. The proprietor of an estate in Ireland is as free to give a nineteen years’ lease of one of his farms as if the property lay in Scotland. Such being the case, we cannot see that the alternative to an uncertain and impoverishing yearly tenancy is to impart a proprietary or permanent interest in the soil. If letting land from year to year be bad, as we know it is, why, in the name of common sense, do not the Irish, like the Scotch landlords, grant leases for a period of years? After the repeated explanations that have been offered on this subject, it is provoking to find that Irish authors and lawyers are to all appearance as ignorant of what can be done by properly-arranged leases of land as if no such things existed. They just see two ways of proceeding—the yearly tenancy system, and the qualified or full proprietorship. Perceiving that the renting of land from year to year, with the chance of continual ejection, ruins the productiveness of the soil and leads to hopeless misery, they rush to the conclusion that the practice is to be got rid of only by substituting some species of *ownership*. Must we repeat that there is a middle course, which has been pursued with the greatest success in Scotland, and that it would be at least worth while to try the same in Ireland before attempting to upset society by new projects?

Mr Scully’s method of reform is amusing. His plan is ‘to encourage the creation, with the consent of the owner, and by voluntary arrangement between landlord and tenant, of a simple description of tenure or estate; which, without any injury or coercion to

* ‘Life of Tasso,’ prefixed to Fairfax’s translation. 1844.

wants the owner, will secure to each occupier a permanent interest in his holding, and eventually identify the actual occupation with the absolute ownership of the soil. The state, the owner of the land, and the occupying tenant, should each be a party to any voluntary arrangement by which all would be benefited alike. Any new system should be as simple as may be consistent with its possessing such peculiar advantages, as will effectually induce its speedy adoption, and tend to carry out its leading objects, of uniting the ownership with the occupation of the land, and of increasing its value by facilitating its future transfer. To effect these objects, the state should enforce and continue, as appurtenant to the land, the several incidents to become attached to it by the voluntary adoption of the improved tenure. For this purpose it will be necessary that a land-tribunal shall be constituted, in order to represent in each case the interest of the state, in sanctioning an adoption of the improved tenure, as well as in superintending its original creation and future continuance.

In this exposition there appears to be a curious confusion of ideas: the state is called upon to enforce and sanction voluntary arrangements. If proprietors are pleased to enter into bargains to sell lands to their tenants, pray what hinders them from doing so in the present state of things? But in this, as in many other matters, the Irish mind looks to improved action only through state interposition—as if the people were children, and could do nothing of their own accord. There is to be a public land-tribunal—a precious job doubtless it would be—which shall ascertain and fix 'the fair letting value, or the net annual rent which a solvent tenant can afford to pay above all rates, taxes, and public charges, including the entire poor-rates, quit-rent, and tithe-rent-charge.' The tenant is thus to 'have a perpetual interest, so long as he may continue to pay the rent agreed upon and fixed at its fair letting value.' And if the tenant pleases, he is to be at liberty to buy up his land by paying certain instalments of its value. If he have not cash to do this, he is to be permitted to borrow money on debentures; and, if need be, government is to lend him what he requires!

Such is the sober proposal of a Queen's council to settle the Irish Land Question. It is settling it with a vengeance! The scheme is a regular confiscation. A set of penniless occupants are to be allowed to take permanent possession of the lands on which they happen to be planted, the proprietors, under a mysterious kind of voluntary compulsion, being treated as nobodies in the transaction. It would scarcely be worth while to treat this modest proposition with anything like seriousness, were it not unfortunately the case that absurdities of this kind pass for sound political economy among a certain class of minds. Most strange is it that so acute a people as the Irish should listen to such reveries; and it is to warn them against these visionary ideas of social reform that we venture an allusion to the subject. As plain-speaking in matters of this sort is the most friendly, we trust not to be misunderstood when we say that the outcry about tenant-right and fixity of tenure proceeds on an erroneous conception of the relationship of landlord and tenant—that is, of mutual rights and obligations. We must, in particular, condemn the notion of calling in the state to settle the terms on which land is to be let or purchased. The state has nothing to do with private interests. Every man is entitled to ask what rent he likes for his land, or to demand what price he pleases for any article he has for sale. And on the same grounds, every man is entitled to refuse taking lands or buying goods on the terms so proposed. Freedom to let, freedom to sell; freedom to go, freedom to come. Thorough liberty between man and man, to deal or not to deal. These are the true economics at which society has arrived; and we would as soon think

of calling in the state to regulate the price of quartern-loaves as to fix the terms on which landlords and tenants should carry on their dealings.

But the Irish small farmer is oppressed. His landlord will not deal with him fairly. He will not give him a lease, nor will he do anything for his lands. He leaves the poor man to struggle on with an insecure tenure, and turns him adrift when it suits his fancy. If all this be true, Irish landlords are demons, not men. It is our impression that Irish proprietors, though mistaken in some things and reckless in others, are still human beings, and governed by ordinary motives. We do not believe that any landlord will do a cruel thing merely for the wicked pleasure of doing it. It is more than probable that there are faults on both sides. One very common reason given by Irish landlords for not granting leases is, that were they to do so, the lands would be sublet, and that instead of having one they would have fifty tenants. They let a farm of a hundred acres to one man under the strictest obligation not to sublet it. No sooner, however, does the lessee enter into possession than he sublets it, in whole or part, to twenty tenants, giving each five acres; then these five-acre-men sublet again in smaller portions; and before the landlord has time to turn round he finds his lands occupied by probably fifty families. Now if there be the slightest foundation for representations of this kind, it is evident that the state is powerless in providing a remedy. The evil lies in the necessities and feelings of the people. Suppose that Mr Scully's plan were carried out of giving a permanent interest in a farm to one tenant, the mischief would not be mended; for this single tenant would speedily assume the position of a middleman, and his subtenants would stand as much in need of fixity of tenure as he did himself. In short, unless the more substantial class of tenants in Ireland engage to work out covenants to the letter, and carefully exclude squatters and subtenants, there can be no hope of reform in land-tenure. On this point the whole question hangs. In Scotland no such thing as subtenancing is known or permitted. The tenant of a farm under lease must walk into it himself, and himself alone. The instant he introduced a subtenant, even for so much as a potato-garden, he would vitiate his covenant, and would be requested to vacate. Fortunately, there is no Court of Chancery in Scotland to interpose difficulties and heap up expenses, in the event of any such difference arising between landlord and tenant. The law is simple and of ready application through the agency of effective local tribunals (sheriff-courts), and every facility is afforded for the due execution of land-contracts. Provided, therefore, that landlords and tenants do their duty, tenant-right, as it is called, has no purpose or meaning. The proprietor lets his lands for a series of years on certain stipulated terms; the tenant accepts the lease on these terms, and honestly works them out. What more is wanted? Generally, in Scotland, the lease is for nineteen years. At its commencement, the landlord builds a farmhouse and offices, including a thrashing-mill, moved by steam or water power, or puts those things in repair if they already exist. He also encloses the fields with fences and gates, and makes farm-roads. The tenant has only to sit down comfortably in the dwelling prepared for him, and to set to work boldly with his capital to keep the land in condition, calculating that what he expends will be amply repaid before the expiry of his lease. When that period arrives, he either takes a fresh lease on similar terms, or goes off in quest of something more advantageous. The idea of pestering the legislature to give him a permanent right to the land he has tilled never enters his head: if it did, he would only be laughed at by his more discerning neighbours. Is there anything in the soil or atmosphere of Ireland that should dispose a tenant-farmer to entertain notions which are scouted in other parts

of the empire? Nothing. The fault is in social habits and circumstances; and the remedy, as we apprehend, lies not in crotchety legislation, but in a resolute disposition on the part of all concerned to follow out in all integrity and mutual kindness the practices which have elsewhere led to peace, prosperity, and happiness.

SMITHFIELD.

SOME other agencies besides the barriers which in this country hedge in individual rights, or the 'wisely-and-slow' principle, which in matters of legislation suits the genius of our people best, have operated to defer the final sentence, now at last passed, of extinction upon Smithfield Market. One especially has been, that whilst the Smithfield champions have sturdily vindicated in words the purity, healthfulness, inoffensiveness of their beloved protégé, stoutly affirming that if there was any difference between the effluvia of Smithfield and Kensington Gardens it was in favour of the former; they, like sensible men, have been all the while keeping Master Smithfield steadily and quietly under the pump—washing, scrubbing, scouring, regulating, disciplining, with such good-will and effect, that positively there is all the difference in the world between his appearance now and what he was a comparatively short time ago. The aldermanic fancy-sketch of the metropolitan cattle-market which has so amused us all—a livelier Arcadia, enjoying a good, rattling trade, and possessed of a highly-sanative as well as balmy and wooing breath—is scarcely a more laughable exaggeration, as matters are now managed, than the wholesale imputations of reckless cruelty, barbarous violence, remediless confusion, frightful peril, and horrible filth, urged against it by equally imaginative opponents. The truth is that, thanks to its zealous patrons, Smithfield Market will die with decency, and by no means leave so unsavoury a reputation behind as if it had been hurried out of existence with all its odours rank upon its head. It is pleasant to part in so improved a spirit with a very old and for very many years useful and respectable acquaintance—so much so, indeed, as almost to reconcile one to the very lingering and painful struggle which has preceded the final exit.

Smithfield Market, for yet a little while, is one of the great sights of the metropolis, than which none offers a more vivid idea of the gigantic extent of the multitudinous population whose myriad mouths require to be alimented twice in each week with so prodigious an amount of flesh, over and above the enormous quantities of dead meat brought daily by rail from the provinces. The cattle-market days are Monday and Friday—the former being exclusively devoted to the sale of beasts, calves, sheep, lambs, with usually not a very large contingent of swine. Friday, in addition to all these—with a strong preponderance in pigs—displays a goodly show of donkeys, horses, vehicles, harness, whips, and other agricultural adjuncts, and is altogether a much more miscellaneous, noisy, and huckstering fellow than his grave and respectable elder brother, Monday. Tuesday, Thursday, and Saturday are hay and straw days, whilst Wednesday is a *dies non* in the Smithfield calendar.

Preparations for the Monday traffic commences in Smithfield soon after ten o'clock on the Sabbath evening. The holy day is then verging towards its close; respectable citizens are either in bed or preparing to retire thither; and the large expanse of Smithfield, with its intricate tracery of sheep and swine pens, cattle-rails, dimly visible in the light of the market gas-lamps, aided here and there by the dubious flicker of partially-closed taverns and gin-shops, is tenantless, save for a few passengers hurrying east or west to their homes before the brute-arrivals bar or encumber

their progress. There is consequently little to excite attention just at the moment, except it may be that the gate in the long, grim façade of St Bartholomew's Hospital opens for the reception of an accident, or that you chance to look up and are startled to perceive the great dome of St Paul's looming over the venerable building, as if watching, like you, when the huge stir and bustle necessary to the sustenance and life of the vast city above which it towers shall begin. You do not wait long. Police-officers, especially appointed for the duty, arrive and take up their appointed posts; and if you enter any of the houses of public resort—that, for instance, which proclaims in huge letters that whoever is desirous of obtaining 'wool for yarn' should buy the particular 'cream of the valley' sold there—you will perhaps see a paper stuck up on which is written the number of beasts and sheep which the salesmen who attend the market have notified to the booking-office will be the probable number requiring accommodation. Usually the actual supply falls short of the number expected, and very rarely indeed exceeds it. The publication of the quantity of stock anticipated affords, nevertheless, both buyers and sellers a sufficiently-accurate idea of the proportion of the supply to the probable demand, and in some degree governs their operations. The number of beasts expected on the 15th of June last was 8985—an amount considerably below the average—and 84,510 sheep. Imagine—but no one who has not seen this market can form any adequate idea of the scene—40,000 animals, including calves and pigs, congregated on a spot which a man's voice but moderately exerted could, during the night silence, be easily heard across, either way, from north to south, from east to west—from the entrance by Giltspur Street to Smithfield Bars, or from that by Snow Hill to the Three Foxes Court in Long Lane! We have been told, upon very high authority, that there are not more than two or three general officers in the British service who would know how to get 40,000 disciplined men in or out of Hyde Park. If this be so, either regimental soldiers are less orderly and docile than sheep and oxen, or the generals less masters of their business than the Smithfield drovers; for you will presently see that numbers of animals march in, take up their positions, and in due time march off again, with a despatch, regularity, and order which, under the circumstances, must be considered perfectly admirable. Now and then, to be sure, a silly sheep, at odds with destiny, will bolt suddenly off with a dog at its heels; but whatever speed may be put forth, it finds, alas! no egress from the perplexing maze of pens in which it is involved; and very soon, in obedience to the cry of 'Turn un—turn un,' is made to retrace its steps, and rejoin its Norfolk or Southdown companions. Perhaps, too, a *recalcitrant* calf, obstinately inimical to conversion into veal, whilst gently led along by a halter, starts off with the boy in charge, and is with some difficulty restored to his place in quadrupedal juvenile society; or it may be that a restive pocker, here and there, with the inveterate hogglish propensity by which he is distinguished of scampering off in precisely the opposite direction to that which leads to where his presence is most ardently desired, creates a momentary confusion; but with these trifling exceptions the behaviour of the animals, as far as my observation has gone, is generally unexceptionable. The larger and more valuable ones especially permit themselves to be tied to the rails without a murmur, except indeed an occasional 'Boo—o—o—o—' should be so interpreted. But this is doubtful, to say the least of it. I have heard them emit the same sounds whilst revelling in Saintfoin as when on view at Smithfield; and as a somewhat celebrated lady in her *Travels in the East* very truly remarks: 'Man as yet—(nor women either for that matter)—has done nothing to bridge over the gulf which lies between him and mental intercommunica-

tion with the lower animals,' and it is therefore obviously impossible to say what the lowing of the ox, the baying of the sheep, the neighing of the horse, or the braying of the ass, precisely indicate—albeit it must be conceded that the squeaking of swine has a rather exact significance. Nine-tenths of the noises, too, in Smithfield are made by the calves—a fact in natural history which persons of experience in the world will have no difficulty in believing.

'Ding-dong!—ding-dong!' It is half-past ten o'clock—the official hour for the admission of sheep is striking; and see, there glides in through Smithfield Bars the first instalment for this night of the tide of animal life constantly pouring from north, south, east, and west of the United Kingdom; from France, Holland, Germany, Spain, Italy, towards this great centre of carnivorous consumption. The permanent pens, each capable of holding twelve sheep comfortably, but which upon occasion accommodates sixteen or eighteen, fill rapidly under the guidance of the drovers—men licensed by the city authorities, and wearing a numbered brass-badger on the left arm. These persons are employed and paid by the salesmen—a highly-respectable body of tradesmen, to whom the stock forwarded for sale in Smithfield is chiefly consigned. The drovers are sent out to meet the sheep or beasts expected by rail or road; and as none but they are allowed to work in the market, the disposal of the animals is managed with a celerity and system which could not be attained if strangers were permitted to bring in and arrange the cattle. There are not many short of two thousand of these drovers attached to Smithfield Market—rude, coarse fellows no doubt, and in matters not pertaining to their business ignorant enough, but in that exceedingly expert, and generally trustworthy. The 'regulation' instrument of 'torture' which they use is not a very formidable instrument, but a stick about the thickness of a stout man's thumb, rather more than four feet in length, with an iron point at one end projecting not more than a quarter of an inch. Nevertheless the innate savagery of some vicious natures is at no loss for means of cruelty, and the vigilance of the police-officers is especially directed to the prevention or chastisement of acts of brutality. The last morning I visited the market I observed to one of the officers—a civil and intelligent Scotsman, by the way—that I had been looking on for five or six hours, and as yet had seen nothing of the outrageous cruelty said to be so prevalent there. 'I should hope not,' he replied with a laugh. 'A good deal of that is mere stuff and nonsense, though of course cattle can't be got to their places and haltered as gently and tenderly as babies are put to bed. Not but what the drovers require sharp looking after. This very morning we dropped down upon two of them before it was light, and locked them up for what we deemed cruelty.'

There can be no doubt that the greatly-improved aspect of Smithfield is in a great degree due to the vigilance of the now admirably-organised police-force—a body of men not only highly efficient in their vocation, but extremely serviceable just now as interpreters of the mysteries of the market to the numerous foreigners—Germans principally—I have noticed, who visit this metropolitan lion at about sunrise. The astonishment of these gentlemen as the vast droves pour in hour after hour is often very vehemently expressed, especially after hearing from an officer the number that will probably arrive: 'What you say? Forty, feefty tousand! Mein Gatt! And you shall throw a stone over the place!' They are not so fortunate when driven to drovers for information. One rather ludicrous instance I myself noticed. A gentleman, one of a party of five, and their interpreter, flushed with the flying colours with which he had come off in his colloquy with a polite police-officer, must needs venture his English with a

coarse-grained, wiry-tempered old fellow, busy at the moment in getting some refractory sheep into place and order, and in so doing encountered a specimen of sour-krouit quite new to him. He wished to ascertain where the man got his badge, and very civilly said: 'How you get, my goot friend, the arm-brass with figures?' As he touched the article whilst speaking, he was sufficiently comprehended, and the drover merely squinting at the questioner from the corner of his eyes, and without for an instant discontinuing his operations with the sheep, answered quickly and gruffly: 'Byes'em; ces a do byes'em!' The gentleman stretched his ears eagerly, but they conveyed no intelligent sound to his brain. English of that kind had never, he was sure, been taught in Faderland. 'What you say, good man?' he anxiously replied—'what you say?' The answer was this time unbroken by a comma: 'Byes'em ces a do byes'em!' The querist was completely nonplussed; his reputation as a linguist fell rapidly with his companions; and I hastened to remark that the gutturals he had just heard was Smithfield for saying that the market authorities, when granting the badge, charged the recipient a certain sum for it.

But to resume the progress of the market. The hour-and-a-half's monopoly enjoyed by the sheep has sufficed to about one-third fill the pens; and now, twelve o'clock having struck, on come the dense, bellowing herds of oxen—stirks, stots, heffers, cows; short horns, straight horns, crescent horns, long horns, no horns; black, white, pied, dun, red; on come the huge beasts, and as they arrive are with surprising dexterity and dispatch securely fastened to the strong market railings. From this hour, midnight, till seven or eight in the morning, the living stream of beasts and sheep, and calves and pigs, gradually attenuating of course, and with widening intervals, will pour on. Those who, on a fine summer morning, have watched at an early hour any of the great roads leading into London, will agree that the sudden and repeated appearance of the droves or flocks at the brow of an eminence, or at a turn in the long, silent vista, bringing, as it were, the light with them, presents a panorama of the liveliest and most pleasing kind. It is not till about half-past five or six o'clock that the swine make their entrance into the market, and at about the same time numerous carts and small wagons arrive—two-storeyed for the occasion, or having a kind of basket or cage nearly the size of the floor of the vehicle, swinging under it between the wheels, and vocal, like the upper apartment, with the bleatings and baings of calves and sheep. These conveyances are frequently driven by the proprietor of the animals himself; and just now he is pretty sure to be accompanied on the fore-seat of the machine by his wife or daughter, perhaps both, come up of course to see the Great Exhibition.

By this time—half-past five—the market will have assumed a very busy aspect, and if the morning be fine, will present a gay and animated scene. The salesmen, with their ink-bottles hanging down in front of their waistcoats, are at their posts; but if you are to believe the abstracted, indifferent expression of their faces when buyers approach, without wish, much less anxiety, to sell. It is clearly their opinion that purchasers on this particular day ought to esteem themselves fortunate in being supplied at almost any price—the supply, as they say, being so inadequate to the tremendous demand. The buyers, of whom there are probably already several hundreds in the field—many of them in blue aprons, and almost all with a pair of bright scissors peeping out of their breast or waistcoat-pockets—it is equally clear, from the same index-tablet, are merely present as spectators, and with no purpose whatever of purchasing, unless the prices are very low indeed. One has just told the stout, jolly-looking salesman yonder that he is not particularly in want of veal:

he has, in fact, been handling that fine lot of calves—pulling at their tails, peeping at their eyes, looking into their mouths, and feeling their shoulders and loins—from mere habit and curiosity: he asks, nevertheless, what would be about the figure to anybody that really wanted them. The answer in a curt, indifferent tone—for just at the moment the salesman is almost entirely absorbed in a conversation with a friend relative to the weather—perfectly astounds the questioner, and he starts away with an expression of extreme astonishment, almost of disgust. He does not go far: he returns and again examines the animals, just as he says to find out what on earth there can be about them to warrant the demand of such a preposterous price, and finally makes an offer. The salesman's 'No' is quick and emphatic; another bid is made, the salesman relaxes somewhat in both figure and face, and ultimately the buyer—the more quickly should another be handling the calves—extends his right hand, opens it, and presents it to the salesman, at the same time naming his last offer. The salesman ponders for an instant, recognises that it is the purchaser's final word, strikes his own palm into the other's, and it is a concluded irrevocable bargain by custom of the market. The salesman's account-book and the buyer's scissors are out and open the next moment: the purchaser's name and the price he is to pay are down in black and white, and his initials or some other peculiar mark are cut on the hair of the hind-quarter of the calves. Hundreds upon hundreds of such bargains are effected long before the mass of Londoners, whose appetites are thus catered for, are out of their beds. The skill of the buyer consists chiefly in his being able to guess correctly at the weight of the animal, which it is said many of them can do within a stone even of the largest beasts. The reports of the newspapers that beef and mutton fetched so much per stone, sinking the offal, pork so much per score, record merely guess-prices; neither beasts, sheep, nor swine being actually sold by weight. The instant a bullock or cow is purchased, the hair of the animal's tail is cut off; if otherwise, a few of the hairs are pulled out and tied round the tail. These are signs to purchasers that the animals are disposed of, and prevents their being unnecessarily handled, or business-men from wasting their time unnecessarily in contemplation of their beauties. Sheep, the instant two hands have struck a bargain over them, are ruddled with the buyer's mark.

One peculiarity of this market is, that the salesman is not permitted to take money directly from the purchaser of beasts or sheep. There are five market-banks, and into one of these the amount agreed upon is paid; and when the seller has ascertained that this is done, the animals are delivered and driven off. This custom is said to have originated in a desire to protect the distant proprietor of stock from being defrauded of any portion of the price realised; but the real purpose appears to be the prevention of frauds on the city-tolls, which are, on all sheep sold, 2d. per score, and on all beasts, 1s. 8d. per score. These payments can only be demanded of non-freemen—citizens of London who have taken up their freedom being exempt. The charge for sheep or calf pens is 1s. each; entry of sale of horses, 4d. each; of pigs, 4d. per score. The ties of beasts and calves are 1d. each; of horses, 2d. each. The duty on hay is 6d. per load, and 1d. each entry of sale. Straw, 1d. each entry of sale. There being no charge on the sale of horses, donkeys, or swine, the bank-mode of payment with regard to dealings in them is not enforced; so that, as a dealer personally informed us, 'A hundiidual as sells a pig, a 'oss, or a moke, draws his tin on the nail, and it's nothink to nobody.' The tolls and dues enumerated have been adopted in the government bill for erecting a new metropolitan market, and must, in the case of Smithfield, equal the revenues of half-a-dozen German principalities. Bear-

ing this in mind, and that moreover a sum of about £300,000 changes hands there weekly, the fierce and protracted resistance opposed to the abolitionists by the civic authorities at once assumes a natural and intelligible aspect and character.

The time for closing the market on Mondays is twelve o'clock, after which carts, wagons, and other vehicles may pass through; but it is usually two or three hours later before business is entirely over, and the unsold stock—seldom a large quantity—drawn off to the neighbouring lairs, there to remain till the next market-day. Swine especially, which arrive later than sheep and oxen, may be seen in every gradation of porcine existence, from the huge bacon hog to the milk-fed innocent whose roasted succulence has been so unctuously celebrated by Charles Lamb, panting in their exposed pens beneath the rays of the noontide sun, in scarcely-diminished numbers. The donkey and horse market is on Friday only: the first come early, but the 'osses,' which are 'strawed'—that is, which have a bunch of straw tied to their manes and tails as a token that the proprietor is open to a reasonable offer—do not arrive till two o'clock, by which time the demand for beef and mutton is supposed to be over. The din and lubbub at about the time of the horse-market, caused by the shouts and cries of ginger-beer, oyster, whip, and other vendors of miscellaneous products—the 'Hi! hi!' of the donkey-dealer whilst exhibiting the merits of his animals—the cracking of whips and trotting of horses up and down—must be heard to be fully appreciated; constituting, as they do, a deafening uproar and tumult, compared with which the noise and rattle of Fleet Street at its busiest hour of the day sinks into insignificance. There are, of course, horses of every degree of value sold in Smithfield, and bargains may doubtless be picked up there occasionally; but it is not a place in which an amateur in horse-flesh should try his 'prentice-hand at purchasing. If there is one thing that cannot be successfully assumed, it is that of being a judge of horse qualities in the presence of a Smithfield dealer. However wisely and cautiously you may utter sententious depreciations of the animal after, as you think, the exact manner of the really knowing ones, he will detect with unerring sagacity the innocence of your heart in your speech or look; the price will be adjusted to your capacity with marvellous readiness; and you may fully depend that when the bargain is struck, another guess-sort-of-animal than the horse you have purchased has been sold. If you doubt the truth of this, make the experiment: once will quite suffice.

In this brief sketch of the great London cattle-market, many incidents and peculiarities which give it life and colour must necessarily be omitted; but the temporary visitor to the metropolis may rest assured that a visit to these scenes, soon to become matters of history only, will be amply repaid by what he will witness there. In conclusion, we may remark, that although every possible expedient has been adopted to insure the orderly and merciful management of the market, there can still be no question that its restricted space in the heart of a crowded city, the want of commodious lairs for unsold stock, the close and fetid holes and corners in which the animals are slaughtered, and the danger and inconvenience necessarily attendant upon driving such immense numbers of horned cattle through populous and narrow thoroughfares, fully justify parliament in enforcing its removal. The new market is to be situated at not less than five miles from London. This in itself will no doubt be a great change for the better; yet it may not be amiss to remark, that the danger of cruelty to the animals themselves, of which we have heard so much, will be rather increased than diminished by the change, inasmuch as the supervision which a jealous, antagonistic public exercises upon Smithfield will be to a great

extent withdrawn. It may affright the human imagination to picture to itself wretched, tortured animals battered to death amidst filth and darkness; but to the poor beast itself it is the same thing whether the blows be dealt in a dark cellar or in an open, freely-ventilated abattoir. It is a detestable cruelty wherever committed; and especially now—when, by the discovery of chloroform, science has afforded an agent by means of which the necessary taking away of animal life can be effected without the infliction of pain—such a brutal mode ought not to be persisted in. Many 'practical' eyebrows will doubtless be elevated at the suggestion. It is one, nevertheless, which public opinion will ultimately force upon reluctant butcherism; and the Cruelty Prevention Society could not act more efficiently in their humane vocation than in urging its early adoption.

STORY OF DUNCAN CHISHOLM.

SOME recent parliamentary papers embody the story of a remarkable adept at deception, and so useful is the moral that may be drawn from the perusal of this half-droll, half-melancholy case, that we depart from our ordinary custom in not noticing matters of state concern. We present the story pretty much as it has been ably condensed from the original 'blue-book' by a clever northern newspaper.*

Those who were familiar with the pretty little town of Inverness five-and-twenty, or, it may be, thirty years ago, must remember the hero of this story. Duncan Chisholm, says our parliamentary authority, seemed at that time to be about thirty years of age. He was somewhat slender in person; his stature was of the middle size—or, to be more specific, he stood about five-feet-nine in his boots; his shoulders were high, his complexion sallow; and it was particularly remarked that he seldom looked any one in the face. For his dress, he affected a blue surtout, a black waistcoat, pantaloons, and a hat. He united the somewhat incongruous vocations of a solicitor and dealer in leather. Between these two professions it was fated that Duncan Chisholm should fall to the ground: in plain terms, he found his way into the list of 'sequestrations' in the *Gazette*. On becoming bankrupt, he clandestinely left Inverness, and could not be found, although a reward of fifty guineas was offered for his apprehension.

Years rolled by, but no tidings were heard of the vanished solicitor. By many he was believed to have been long dead and buried, when suddenly a rumour reached Inverness that he was yet alive and well. Many and stiff were the tumblers of toddy that were drunk that night in the capital of the Highlands, in discussing the credibility of a report which affirmed that the broken-down leather-seller of Clach-na-cuddin was now, under another name, a man of fortune, high in office in Dublin Castle, a dispenser of magnificent charities, the counsellor of statesmen, the instructor of parliaments. Even so it was: when closely questioned, Mr George Mathews of the secretary's office in Ireland confessed his identity with Duncan Chisholm, the man of law and leather in Inverness; and seeing that better could not be, he told the story of his transformation. Enlisting in the 53d regiment of foot, he rose to be a sergeant. He was reduced from that grade after a few months, only to rise again to a higher rank—that of staff-military-clerk in the brigade office at Dublin. Hence, about 1833, he made his way as a clerk into the Irish Tithe Office. Five years afterwards he was appointed secretary of the Tithe Million Fund, with a salary of ten pounds a week, besides his pay as a clerk in the Irish secretary's office. His ascent was now rapid: another year or two saw him in the management

of the Regium Donum Fund of £30,000 a year, closeted with Irish secretaries, controlling Irish estimates, and despatched to London when the Irish government wanted 'a useful witness' to stop the mouth of a troublesome committee.

Such splendid success could scarcely fail to provoke some little envy. The Irish government were duly informed of the Highland antecedents of their fortunate friend, and were particularly requested to see that his accounts were properly vouched and audited. The hint was taken—a board of inquiry was appointed by Earl de Grey, the viceroy of the day; but that board reported that Duncan Chisholm, *alias* George Mathews, 'was a public servant of unimpeachable integrity'; and Under-Secretary Lucas was instructed to convey to the much-maligned gentleman the lord-lieutenant's opinion that he had been 'completely and honourably acquitted of every charge affecting his character.' This was in the spring of 1842. An acquittal so emphatic seems to have silenced complaint if it did not remove suspicion; and it is not until after seven years have passed that the attention of the Irish government is again drawn by Mr Sadleir, the member for Carlow, to the proceedings of Mr Chisholm or Mathews. Mr Sadleir's letter goes over the old field, and breaks some new ground; but Lord Clarendon sees nothing in the statement to shake his full confidence in the verdict of 1842, and pronounces, therefore, that 'any new inquiry would be unfair towards Mr Mathews, and is unequalled for on any public ground.' Mr Sadleir returns to the charge, which he enforces by at least one strong piece of evidence; but still Lord Clarendon will not be moved, and the member for Carlow then retires discomfited from the lists.

But Duncan Chisholm had made to himself enemies more implacable than any political adversary. By the patronage which he lavished on the small religious sect of whose tabernacle he was a pillar, he had roused the hatred of some other sects of nearly the same persuasion. When once thoroughly excited, the *odium theologum* never dies, never tires, never relents. The detection which had baffled successive viceroys, secretaries, and statesmen, was at length accomplished by the persevering enmity—'the patient watch and vigil long'—of two or three dissenting ministers who differed from Mr Duncan Chisholm on certain recondite points of doctrine. The charges against him were once more renewed—another commission of inquiry was appointed; but before it could begin its labours the accused had admitted his guilt by an ignominious flight. The whole mystery was now at an end, and the twelve years' official career of this man, for whose 'unimpeachable integrity' two lords-lieutenant had stood willing sponsors, was proved to have been one continued tissue of crime and imposture. The amount of public money which he had plundered by fraud and forgery does not exactly appear, but it must have been large—and the daring way in which he effected his pilage is not a little remarkable.

We have said that he was a shining light in a petty religious body. This was a sect describing itself as 'Trinitarian Presbyterians, holding what are theologically called non-subscribing principles—that is, rejecting subscription to any creed, confession, catechism, or other formulæ as a test or condition of admission into the ministerial office.' This denomination, consisting only of a few scanty congregations, seems early to have presented itself to Chisholm as a convenient means for carrying on his robbery of the public, while he gratified at the same time his love of sanctimonious display. In the end of the year 1839, by one stroke of his pen he called into being three missionaries of his sect labouring in the south of Ireland; while, by another stroke of the same ingenious instrument, he conferred on these aerial preachers the substantial benefit of a stipend of about £100 a year. The stipend was voted

* Edinburgh Evening Courant.

by parliament, and paid by the Irish government; but as the missionaries never had any existence except in the teeming brain of the Highland leather-seller, the reader will scarcely need to be informed into whose purse the stipend went. What Sydney Smith somewhat profanely fancied of the sideboard of a New Zealand bishop might be truly and literally affirmed of the table of Mr Duncan Chisholm. He found missionaries to be indeed meat and drink to him—pocketing on this head alone, it would seem, somewhere about L.500. Emboldened in his success in the creation of a missionary-staff, the exemplary Mr Chisholm next erected a presbytery. 'The Presbytery of Munster,' says the parliamentary paper, 'was created, in 1840, into a separate body of the Presbyterian Church in Ireland, by Mr Mathews, as a medium through which he contemplated appropriating to his own management and trust sundry funds belonging both to the government and the Presbyterian Church, as well as to carry out other fraudulent intentions.' In these intentions he so far succeeded that he caused to be paid over from the public exchequer to the pretended agent of this new body a sum of L.4220, which was lent out on mortgage, in the name of himself and one or two others, apparently his creatures. He had now a presbytery endowed by the state, and as he had formerly provided it with imaginary missionaries, so he now proceeded to endow it with imaginary libraries. By a stroke of his all-powerful pen he prevailed on parliament to grant the sum of L.1599, 18s. for a 'Presbyterian Congregational Fund Library,' which never had any existence in this sublunary sphere. How the grant was spent is not clearly ascertained, but of course the inventor had his due share. One hundred pounds are shewn to have gone in paying the expenses of Mr Duncan Chisholm and his first spouse in a jaunt to London.

We cannot accompany the parliamentary paper any farther in its exposure of the prodigality of this enormous rogue—his personation of dead men, his personification of men who never lived, his foisting his own relatives into the pension-list, his defrauding the deserving poor of their little pittance, his placing on one charitable fund 'no less than thirty-two persons, all of whom, with a few exceptions, are or were members of the congregation of his own presbytery.' Imperfect as is the outline which we have sketched, it may serve at least to point the twofold moral of this extraordinary history—to shew, in the first place, the fatal facility with which the cloak of religious pretension can be assumed as a screen for the vilest rascality; and to demonstrate, in the second place, the necessity for an instant and thorough purgation of the subordinate offices of Dublin Castle. That such a monstrous and impudent system of deception as that daily practised by Duncan Chisholm should have escaped detection for more than a dozen years is a disgrace to the executive, and may be said to shake confidence in that very self-sufficient thing, the whole red-tapist system!

A NOVEL OF THE SEASON.

AMONG the works of this class that at certain seasons of the year pour in a continuous stream from the press, there are only a few of any mark or likelihood. Occasionally, however, it happens that there is one distinguished from the rest by some beam of thought, some touch of originality, which sets the reader to dream and to meditate, and which, even in the midst of the perusal of more brilliant, and, it may be, more talented works, retains a sort of magical influence over his mind. A book of this kind is termed 'suggestive,' because it supplies the momentum which turns the winged thoughts loose in some prescribed career—when the idea of the author being carried along, as it were, with our own, becomes interwoven in the web of our fancies and reflections.

Such a work is now before us;* but, independently of the leading thought, it possesses considerable literary merit, and, above all, evinces, on the part of the author, a practical acquaintance with society, and the power of reading the human heart through the incrustations of conventionalism. This knowledge the fair writer has repeatedly used for the benefit of our own readers; in sketches, for instance, of the manners of the upper middle classes of this country—those, more especially, who live in the more distinguished kind of country-houses, termed by the English, seats, and by the French, châteaux.

The title—not a very good one—of 'The Cup and the Lip,' refers of course to the proverbial 'slips' that occur so frequently between our wishes and their expected fruition. The book, in fact, is in great part a record of disappointed hopes; but around the principal group of characters there is thrown a philosophical interest apart from the mere adventures that form the staple of romance. The heroine receives the Spanish name of Dolores, in testimony of the disappointment of her parents on seeing the face of a female baby, instead of the male they had hoped for, come to share in their poverty. The description of the first abode of the parents, after they enter upon the scene, is in itself a curious picture, and will be interesting to those who have looked with surprise at certain low, round, odd-looking structures along the coast, called Martello Towers, appearing like pieces of solid masonry:—

'Our readers have probably seen those singular-looking defences on the coast, now used as stations for the preventive-service sailors; but possibly some may not be aware, that at the close of the war they were inhabited by the officers of the coast-guard, and occasionally by their families: better and more commodious dwellings have been since then erected for them, one of which, with its flag-staff and picturesque group of seamen about it, forms quite a pretty object on the summit of the white rock at Hastings. The lower part of the tower, appropriated to Mr Nevil's men, was a magazine of arms and powder. You entered the singular abode by means of a short ladder. The upper part was divided in halves—one of the divisions being appropriated to the men, the other to their officer.

'The home of the Nevils consequently consisted of only two rooms, each in the form of a quadrant; the sitting-room received a faint, imperfect light from a narrow loophole facing the sea; the bedroom had only a borrowed light from the men's compartment of the tower. On first coming from the glare of sunshine, it was almost impossible to see, even in the room blessed with a loophole; but by degrees, as the eye became accustomed to the obscurity, objects grew more distinct, and the few people who visited Nevil's quarters were then made aware that woman's taste and ingenuity had given the dark, small apartment an air of comfort, and almost elegance. The carpet was bright-coloured, adapted to catch every scanty gleam of light that visited it; the chairs were of fanciful and pretty shapes. Close to the loophole was a couch covered with a brilliant chintz, on which lay two or three snowy pillows edged with lace, and a little coverlet, shewing that it was the spot dedicated to the baby's day repose. A harp stood in the sharp corner of the quadrangle. There were book-shelves well filled; and on the table in the centre a vase of beautiful flowers, a lady's work-basket, writing-materials, &c.

'There were also signs of Mr Nevil's participation in the occupancy of the room—a sword and pistols on the side-table, a small gold compass, and some other nautical instruments. It was wonderfully neat and comfortable for such a place; but light was wanting; and what can compensate for the deprivation of that first gift of the Creator to the universe?

* The Cup and the Lip. A Novel, By Laura Jewry. 3 vols. London: Newby. 1851.

Dolores is born in a pleasanter home than this; but the murder of her father throws a shade upon the spirits of the family; and after this is dispelled by time, the marriage of her aunt, and other family calamities—for this was indeed one—breaks up the circle. "Mamma," said Dolores, as that evening they sat in the dim fire-light alone, "I wonder people think a wedding a happy event! Aunt Katie's was quite a break-up to all our merriment. How we used to laugh in the fire-light, and now we are so grave and quiet! Everything and everybody changed by it: Grandpapa is quite cross when he talks of it, though he wished my aunt to marry; grandmamma looks older and sadder ever since; Mr Marsh is grown dull; you have no confidence now but your poor Dolores; and dear Flossy has never been well from that time. All this discomfort comes from what people call a "happy event."

This Dolores was somewhat plain in her person; but her intellect was, literally speaking, beautiful. She was highly imaginative, but had a sufficient sense of the ludicrous to prevent the romance of her character ever betraying her into absurdity. Without being the least sentimental or "missy" in manner, her poetical taste infused a certain sentiment into the actions of her every-day life. She was perhaps too grave and thoughtful for her age; but that might be accounted for by the deep sorrow in which her infancy had been cherished—by the tears that had often steeped her infant pillow. If, however, she laughed less than Flora did, she was more frequently the cause of laughter in others by her quaint sayings and wild fancies, by her pretty half-real, half-playful superstitions, and by the originality of her humour, which nevertheless tended less to mirth than to melancholy. She was so warm-hearted that it was impossible not to love her; yet few entirely appreciated her. Mrs Nevil was well educated and sensible, but the mind of her daughter was beyond the comprehension or sympathy of her own; and when Dolores ventured to reveal her fresh, original, and sometimes erring opinions to her mother, she was checked and silenced by the conventional reproof or startled exclamation of alarm that met her confidence. Aunt Katie understood her better, and in many points sympathised with her; but Catherine's mind was rather elegant than profound, rather brilliant than comprehensive, and therefore in her even Dolores could not find all she sought. She was thus driven to hold more silent communings with her own thoughts than is perhaps good for any one. Her opinions and fancies, cherished in silence, and never combated by those of others, grew strong and obstinate, and but for a natural tenderness of disposition would have given her an unfeminine degree of self-reliance. As it was, she had great confidence in herself: there was nothing Dolores would not have fearlessly attempted; and this dauntless reliance on her own powers frequently insured her success. She liked overcoming difficulties, or trying to overcome them; and the mental toil and self-development in which she was continually engaged took all weariness from her quiet mode of life, and rendered her as unsusceptible of girlish day-dreams of love and lovers as Shakspeare's

"Fair vestal throned by the west."

The interest of the young lady is excited by a very tall and well-looking young man, with a deep, rich voice, and that expression of melancholy which is commonly said to be so interesting to the softer sex. Walter Livingstone has all the advantages of person and fortune which form what is called in the world a good match; but although sufficiently partial to female society, and to that of Dolores in particular, he appears to have no thought of marrying. He hovers, however, round the poor girl; and without any idea of even trifling with her, engages her in correspondence, and yields as if by fatuity to a fascination which can have no result but disappointment and misery. Dolores is

astonished; but her perplexity reaches its height upon a conversation held between them at a time of family calamity and excitement which has drawn them into confidential familiarity. The occasion is the elopement of Aunt Katie's unworthy husband.

"Dolores stole softly to his side, and for a few instants neither spoke. There was something solemn and silencing in the scene before them: the quiet expanse of mighty tranquil waters; the dark sky, with its myriads of cold, bright stars; and the hymn, meant to be triumphant, but which had nevertheless a strain of mournfulness in its quaint melody. At last the voices died away, and Livingstone turned towards her: she could not see the expression of his face, but she fancied that he was agitated, and she hastened to deliver her message, adding, as she ended it: "This is a sad Christmas-eve, Mr Livingstone. I wonder if through all England there is any one at this moment more miserable than poor Aunt Catherine."

"She was startled by his catching her hand and exclaiming vehemently: "Yes, Dora, I am!"

"You, Mr Livingstone?"

"Ay; a curse has followed me from my birth, and will rest on me till those quiet stars shall shine upon my grave!"

"A curse!"

"Ay; one that I must keep hidden within my own soul—one that cannot be alleviated by sympathy! If I were to tell it to you—even you, tender and truthful as your spirit is, would shrink from me in fear and horror!"

"Surely no! I never could feel fear or horror of you."

"You could—you would! But this is not a time to harass you with a new tale of the woe this wretched earth bears upon its bosom. Good-night, Dora! When you pray for yourself and Catherine, pray also for Walter Livingstone."

"He grasped her hand in his, and pressed it earnestly—then turned again towards the window, shrinking behind the curtain-fold, as if desirous to hide the passionate emotion that shook his frame. Dolores remained stupefied: there was terrible anguish in the tone in which his wild words were uttered. She longed to comfort him—to implore him to confide in her—to trust to her sympathy and her silence; but a feeling of shyness stole over her, and she could not utter one word beyond the timid and tearful "Good-night," with which, after an instant's pause, she left him."

The ponderings of Dolores upon this singular text—the hold taken of her heart by the image of her unhappy friend—the longing that arose within her to soothe and comfort him—all may readily be conceived, for they belong to the ordinary routine of a generous womanly passion. We cannot follow the story, however, even sufficiently to break the wildness of the conception; but Walter Livingstone is *insane*, and knows that he is so! It would have been well for him if his illusions, which were of a harmless and poetical kind, had extended throughout his whole life; but unfortunately they occurred only at rare intervals, and in the whole lucid space between he had the horrible conviction that he was a madman.

Another lover appears upon the scene—the cousin of Livingstone; and in him the family disease assumes a new form, and receives another name. The one has an unsound mind, and the other a depraved heart; and in the contrast between the insanity of the intellect and that of the affections lies the philosophy of the work. Livingstone is stripped of his property, and goaded into accessions of the malady by his cousin; and this gives rise to the exhibition of feminine devotion in a strange and original form. Dolores, who has become, by the accidents of life, a wealthy heiress, receives her insane lover into her house, and nurses him as a mother nurses her sick child. He is legally

forced, however, from her protection, and immured in a madhouse; from which eventually he makes his escape: whereupon she determines, if there should prove to be no other means of accomplishing her purpose, to give herself a legal claim to the guardianship by marrying him! Having helped him on thus far, let the reader pursue the story for himself.

It would be unfair to conclude without adding that, amid all its serious purpose, there is a good deal of amusement in the book. The half-witted major, who is in love with Dolores in the days of her poverty, is sketched with great spirit; and the mode he at last hits upon of making her an offer of his hand, after gazing, and laughing, and asking questions, and saying 'it does not signify' through half a volume, is very ingenious. 'The place was accordingly hired, and the day fixed for their departure from London. Major Simpson was much distressed on learning their intention: he called every morning, asked Dolores "Where she liked best to live?" and answered her reply invariably by the observation, "that it did not signify!" She grew quite used to this daily interrogatory, and at last scarcely heeded it; but the day before they left town a more decisive proof of his interest was vouchsafed her. He came earlier than usual, and, after talking for some little time in a nervous and less connected manner than was his wont, drew from his pocket a very splendid filigree card-case, and asked Dolores to look at it. She examined and admired it.

"Oh, but open it—pray open it, and look at the cards, Miss Nevil."

'She complied, and read "Mrs Simpson," engraved on their smooth surface. Rather puzzled, she looked up inquiringly at her companion: he coloured a good deal, laughed sheepishly, and asked: "Do you like it—eh! eh?"

"Yes; it is a very pretty case, and the cards are very nice."

"Eh—yes—I should say! very nice, eh! It looks well—Mrs Simpson—eh?" And drawing out a card, he examined it as if it were some rare work of art, ending his inspection by the nervous laugh he always found difficult to stop, and in which, in spite of all her efforts to be grave, Dolores now joined.

"Very good," he said at last; "very good—capital, isn't it? Quite my own idea: nobody ever thought of that before, eh—eh?"

"Of what?" asked Dora greatly mystified.

"Why—eh! to be sure, you understand? You'll keep the card-case: it is for you!" And, charmed at his own sagacity in this ingenious mode of proposing, he gave way to another extraordinary burst of laughter.'

SECRET OF TAMING ANIMALS.

We have no direct means of divining the 'why and because' of certain predilections and prejudices observable in birds and other animals. We daily see actions among them for which we cannot in any way account. Thus, for instance, if a dog enter a room full of company, you shall presently observe him make a careful tour of the apartment, sniffing first at one and then at another of the assembled guests. Towards some his tail will be seen to wag with every symptom of kindness and good-will; whilst towards others he will, with tail deflected, shew unmistakable signs of suspicion, perhaps of disgust. Depend upon it the animal's discernment is rarely at fault. I would willingly be guided by such a Mentor. Just so is it with the feathered race. Some masters and mistresses can never tame their birds: never get them to be on terms of intimacy. The cause is evident. There are no feelings of affection in common between them. They do not love their birds. The latter know as much, and are assuredly aware that they are kept simply for the sake of furnishing amusement. I have noted the same unerring sagacity with all my squirrels. They would constantly detect any

person who might be preparing or wishing to play them off some practical joke, and would, to my great delight, fasten on them at once—paying handsomely and in full for all favours 'about to be' received. It was, however, impossible for me to anger them. They too well knew the friendliness of my disposition—seeing what merry romps and gambols we had together, both by day and night, up-stairs, down-stairs, and in the garden. No doubt it is a wise provision of Nature thus to endow our little friends with instinctive powers of perception. The face is the index of the mind. They read our character when they catch our eye.—*William Kidd, in the Gardeners' Chronicle.*

THE VENAL SANCTUARY.

BY THE REV. JAMES GILBORNE LYONS, LL.D.

'Where in our churches is the place for the poor? I ask this question with shame and sorrow: WHERE IS THE PLACE FOR THE POOR?—* * * Admit that here and there a poor person has a seat: WHERE IS IT? Is he invited to sit with us "in a good place," or do we say to him: "Stand thou there, or sit here under my footstool?"'—*Right Rev. Bishop Ives.*

'I will bring your sanctuaries unto desolation.'

Leviticus, xxvi. 31.

I TROD the hallowed ground that bore
A Christian temple tall and proud,
When at each wide and lofty door
Went streaming in a gorgeous crowd:
A welcome day bid all rejoice—
A fair and ancient festival,
And the glad organ's mighty voice
Shook the strong roof and Gothic wall.

Full many a token marked the fold
Where rich and high believers meet,
The sacred volume clasped in gold,
The costly robe, and drowsy seat:
Priest, people, altar, chancel, choir,
Arch, column, window, porch, and gate—
That ample fane, from vault to spire,
Looked solemn all and calmly great.

But mark! An old and weary man,
A stranger clad 'in raiment vile,'
With failing steps and features wan,
Went tottering up the fair broad aisle:—
They cast him out; oh, faithless race!
On some rude bench—unseen—remote;
Convicted in that hour and place
Of a lean purse and threadbare coat!

Yes! and if He, who saved the lost,
Stood fainting on that haughty floor,
Arrayed in weeds of little cost,
Meek as He sought our world before;
In spite of words which none might blame,
And works of goodness freely done,
That sordid post of wrong and shame
Would greet—JEHOVAH'S ONLY SON.

Oh for a prophet's tongue or pen
To warn the great in wealth and birth,
Who build their God a house, and then
Plant there—the meanest pomps of earth:
To brand that church which spurns the poor
From every vain and venal pew,
Where 'clothed in purple' herd secure
To kneel or sleep—the lordly fow!

Give me the shed, low, bare, and plain,
Where love and humble truth abide,
Rather than earth's most noble fane,
Defiled by selfish pomp and pride:
Give me the damp and desert sod
Walled in by dark old forest-trees,
Roofed over by the skies of God—
But perish temples such as these!

THE MYSTERY OF MONEY.

'HANG them!' said Reynard, turning away from the tempting bunch that looked down upon him with its calm and juicy smile from a height just beyond his reach—'hang them!' said he, 'they are as sour as crabs!' The story is somewhat musty, but wondrously true. Even so do we of the human race console ourselves for our deprivations by disparaging that which we cannot obtain. Riches, fashion, power, dignity—every unreachd goal of desire, every unslaked thirst of the soul, becomes an object of contempt or denunciation; and a large majority of the world pass much time in sneering at the aims and aspirations which are the very life of their lives.

Take money as an illustration. To judge by the terms in which it is spoken of, you would suppose its possessors to be the most unlucky of mankind. Few poor persons can find any better words for it than dross or trash; the devotee denounces it as the accursed thing; and the moralist discovers it to be the root of all evil. Nay, the hatred and contempt with which it inspires those who are baffled in its pursuit, extend not unfrequently to the individuals who have gained that deadly loss; and the rich, instead of being pitied, are abused for their misfortune! But, setting aside the inconsistencies of men, there is something peculiarly mystical in the word Money, which appears to have been disconnected by time and use from the idea it originally represented, and to have become in itself a substantive thing. It calls up no distinct images before the mind; it does not even resemble a pagan god, whose name is suggestive of his attributes—

'And thus from Jupiter what'er is great
Proceeds; from Venus everything that's fair.'

It is rather the superstition than the idol; it is more a feeling than an object; and the larger the sum we contemplate in our thoughts, the more vague and shapeless is the impression we receive.

Money suggests no ideas of grandeur, luxury, or beneficence. Its possessor may be a plain man, of simple tastes and retiring habits; he may be selfish and ungenial; his enjoyment may consist in amassing treasure, in knowing himself to be rich, and in feeling that others know it; or his propensities may be secretive, leading him to hoard and hide, to feign poverty, to steal through the world as an object of compassion, to live in destitution, and die a wealthy beggar. From the word we receive no hint of anything of this. It determines no position, no character; we only know the man *has* money—What is money?

The answer is easy: it comes glibly off the most

juvenile tongue; and we are told that 'money is the representative of purchasable commodities' with some air of scorn at the ignorance betrayed in the inquiry. But the definition serves no practical purpose. It is lost sight of the very next time we use the word; and if we only seize our thought as it passes, we shall find that 'money' stands for nothing but itself. To prove this, let us suppose it to be actually the things it represents; that instead of a well-filled purse, or a coffer of coin, or a current account in the bank, we are surrounded by every article of necessity, comfort, or luxury within our pecuniary means. Let us suppose that with the same ease and directness with which we put our hand in our pocket we stretch it forth and grasp the objects it is our purpose to buy—whether houses, lands, raiment, food, or anything else: let us do this, and we shall find what a marvellous effect the mere substitution of the thing for the word will have upon our views, sentiments, and actions.

The rich man who lives in voluntary destitution we designate by the Latin word *miser*, which means a wretched, pitiful, abject fellow; but if we change the money he hoards into the things it represents, we shall find quite another name for him. This man possesses an elegant house sumptuously furnished, its doors open for his reception, and breathing forth an inviting atmosphere of warmth and comfort; but he shuts both doors and windows, allows the house to stand unoccupied, and burrows shivering in a cold and filthy cabin by its side. He is hungry in this dark and miserable den; and straightway a table is before him, furnished with steaming dishes of exquisite meats, and lighted with perfumed wax. But he looks on—longing, yet unmoved. The dainties he will neither touch himself nor allow others to touch; and he satisfies his appetite as well as he may with such scraps as a beggar would look at with suspicion. After his meal he must go forth upon his affairs; and there are lying before him for his choice clean and comfortable or handsome and fashionable clothes of all kinds; but choosing instead some old and filthy rags, he sneaks into the street, an object of mingled pity and disgust. This self-denial is based upon no religious asceticism: his sole motive is the dread of diminishing by use some mystical value he imagines to reside in the articles in question. He is, in short, a *maniac*.

In a former number of this Journal there was an account—only too true, we are informed—of a man in moderate circumstances, of ordinary intelligence, and some accomplishments, whose attachment to money was so great that he allowed his son to perish of disease before his eyes rather than be at the expense of medical aid. A man like this is commonly termed

'an unnatural parent;' but if we substitute for the money the aid and medicine it would buy, we form quite a different estimate of his conduct. The youth gets worse and worse; his sickly appetite turns with loathing from the ordinary food of the family; and as his father opens a cupboard near him, his hollow eyes are fixed eagerly on a heap of fruits and other delicacies it contains. But the father looks unmoved on the wasted face before him, and locks the cupboard. The patient gets still worse. Oh for skill to investigate his complaint!—oh for medicine to heal and comfort—to cool his parched tongue—

'To draw around his aching breast the curtains of repose!'

Medical men stand close by, but no summons is heard from the father's lips: the table is loaded with the necessary medicine, but the father looks at the sinking boy, and stirs not hand nor foot. A draught—one draught—would yet have a chance of saving him. There: the phial is labelled; a glass stands near—quick, quick! The father folds his arms, looks on as before, and the son dies. What manner of man is this? Still an unnatural parent? He is a *murderer*.

In the opposite vice of extravagance the word plays the very same part. We give away money without knowing what we give. Under that name we throw about food and dresses by armfuls: we scatter bags of corn and sacks of wheat upon the wind, and shovel away whole acres of land for a pastime. We exchange for a worthless gewgaw what appears to us to be pieces of gold; but they are in reality a pile of loaves sufficient to feed hundreds of human beings. If we would only think what money really is when we give it away! If we would only think what it is we withhold when we refuse it!

This unaccountable disruption between the word and the thing has another curious effect. A man who has an extreme dislike to parting with his money without an equivalent, is frequently very ready to give away gratuitously that equivalent when it comes into his possession. Look at the scene which takes place at a dinner-party; but in order to understand the better its moral, imagine that the good things on the table are the actual money they have cost.

'What will you have?' says l'Amphytrion ou l'on dine. 'Sixpence? That is too little. Do take a shilling! Here is a shilling. And you? My dear friend, let me give you half-a-crown! There it is. John, carry these gentlemen at the other end a shilling or two a piece. And now sixpences all round. Here is a sovereign: let me divide it among you. You will find as much opposite you—and you—and you: pray divide them liberally. But first another round of shillings'—and so on. The guests in the meantime receive the coined cheer with festive gratitude. A small portion of it they convert into wholesome food; another portion they swallow outright, to the extreme consternation of the digestive powers within; and the rest, which is by far the greater part, they throw out of the window. This entertainer, be it observed, who is so lavish of the things represented by money, would look very blank if asked for the representative. He would part grudgingly to his friends with coin after coin—if he parted with them at all—declaring and believing that he could not afford the liberality.

Some years ago the operatives of this country had a great fancy for styling themselves, *par excellence*, the

'useful classes'—meaning, that by the work of their industrious hands they achieved a pair of boots, or a suit of clothes, or anything else with which they supplied the wants of their useless employers. These employers, it is true, gave them something in their turn; but that was only money. Had they sent them instead a pile of quartern-loaves, a respectable cheese, and a stone or two of butcher-meat, they would have been cheerfully accorded the honour of ranking among the useful classes; yet the two payments are virtually identical, and the mistake of the operatives is merely another illustration of the mystery of money.

This mystery is so unfathomable, that few men can tell correctly whether they are rich or poor. A man in the middle rank, whose moderate income is just sufficient for the comfortable support of his family in the station to which they belong, reckons himself comparatively poor because he has not more than enough. He looks at the stately dwelling of a neighbour, the multitude of its apartments, the number of servants required to take care of them, and the beauty of the promenades in the demesne to which he and others are allowed free access. 'Alas!' exclaims the repining spirit, 'he is rich!' Why so? He eats no more than you—perhaps not so much; he does not relish his food better; he wears the same number of vestments; he sleeps in a single chamber; and he sits habitually, and from choice, in a single room. If the rest of his food is to be eaten at all, it must be so by other people; if the rest of his house is to be inhabited at all, it must be so by other people. So far as these extras are concerned, he is only better than an innkeeper in having, to some extent, the choice of his guests. For them he keeps numerous apartments in order; for their wants he provides; and for their convenience he employs a retinue of servants. This rich man does not attempt the feats of the circus—he rides but one horse: in short, as an individual, he is in precisely the same position as yourself.

'And the promenades?'

They are yours as well as his, for he has no more means of enjoying them than you. But the fact of their being patent to you and his other neighbours points to a source of enjoyment he really possesses, and the only one from which you are excluded. He has the power to bestow upon those around him a true pleasure, and in the exercise of the privilege consists the only advantage he derives from being what the world—with very little apprehension of the true meaning of the term—calls a rich man.

We are told, in the figurative language of Scripture, that a rich man would find it as difficult to enter into the kingdom of heaven as a camel to pass through the eye of a needle. Nothing can be more true, or more forcibly expressed; for it is impossible for any person who is rich in the signification commonly attached to the word to do his duty either to God or man. Beyond a certain point, where individual appetite, convenience, comfort ends, a man cannot be legitimately rich. What he is unable to absorb personally is an excess, for the use or abuse of which he is answerable. The popular meaning of the term—in which it is of course used by a Scripture addressed, not to philologists, but to all mankind—involves a solecism occasioned by the disruption that has taken place between money and what it represents. Instead of the vague, formless, but imposing idea suggested to us by the expression, 'a rich man,' if we could only conceive an individual with more houses or rooms than he could occupy, with more horses than he could ride, with a vast storehouse of hats, coats, and unwriteables, and with a dinner spread before him consisting of thousands of dishes, we should understand better his position, and see that in the character vulgarly ascribed to him—in which his possessions appear as a part of his individuality—his

chance of getting through would not be at all better than the camel's!

Thus we see 'words are things,' and very important things too. If we would only give ourselves the habit of connecting clear and definite ideas with those we use, we should escape many serious mistakes, and get rid of many mysteries; but of none at once so mischievous and so ridiculous as the Mystery of Money.

A PRACTICAL JOKE.

THE Signor Giulio Mercadante was an Italian nobleman of merry disposition, who delighted in frolic and jovial disportments, whether in season or out of season. But into the villa of this enemy of care death entered suddenly and awfully. One of his followers, Baptista by name, a man of ferocious bearing, of great strength, and of bad repute, was found dead in the garden, stilettoed by an assassin. Report with her many tongues had been busy with his name, whispering that he, as well as another of the signor's servants, named Francesco, had been once enrolled in a bandit troop, but having quarrelled with their chieftain, had thrown off their allegiance, and taken service with the more peaceful Signor Mercadante. People murmured that it was hardly safe to trust them as inmates within the walls of a commonplace, everyday, legally-organised villa. But what was it to them? The signor was surely the best judge of the organisation of his own household; and he knew their former history as well as he knew that at present they were his faithful though rude valets.

'If,' said his lordship, 'they have been robbers, so much the worse for them: they are good servants now, so much the better for me. May the Holy Virgin!'—and here he would cross himself—'intercede for their pardon for the past, and bring before the throne of grace their present faithful service and good deeds!'

When he was told of Baptista's fate he grieved and stormed; he called upon his patron saint to witness his registered vow of vengeance; and then with kindred spirits he sat himself down to his evening repast.

Meantime the body of the murdered man was placed in a kind of summer-house, which stood at some little distance from the villa, and which had Venetian windows opening upon the garden. Here an old crone had paid all necessary duties to the departed, and here his friend Francesco came to see that nothing had been omitted which the custom of his country deemed needful.

'And thou art to be with him this night, Francesco?' said the woman. 'I wish thee hearty joy of thy office! But mind thee, my boy, to leave the window open, that when the Evil One comes for his own there may be no impediment to his entrance.'

'What sayest thou, old mother?' asked the young Italian, stealing a glance at the corpse.

'Why,' said the crone, 'I give you a friendly warning—that's all. Have you not heard, maestro, that when the clock strikes twelve the Evil One comes for his own?'—and here there was a devout touching of the forehead and shoulders, to signify the form of the cross—'and have you not heard that at the same moment the good angels come for their own?—and if there be any impediment in the way to or from the chamber of death, wo be to him who causes it!'

'And what, think you, will be the message for our old comrade there?' said Francesco, trying, under a mask of levity, to hide the perturbation within.

'Think!' said the old woman—'I do not think about so plain a matter! In his lifetime it is well known that Baptista sold himself to the Evil One; and he will surely claim his own. So keep a watch, and leave the window open, that his entering may not be barred. And now, good-night, and fair slumbers keep thee from harm.' And the hag, in nowise deceived by

Francesco's manner, chuckled and hugged herself with her skinny arms as she tottered from the death-chamber.

The Signor Giulio Mercadante meanwhile was entertaining his guests—three young men as thoughtless as himself—with the hapless fate of his domestic; remarking how curious it was that one with deportment in general so rude and ferocious should have the power of inspiring, where it so pleased him, the strongest attachment. He himself confessed to have been brought in some slight degree under this inexplicable influence, and to have felt a certain affection for his uncouth follower. But the greatest proof of this nameless power, he said, was evinced in Francesco; for this poor fellow, despite his former lawless career, was known to be a most unhesitating believer in all kinds of apparitions, be they good or evil: he dreaded ghosts and goblins—he feared the dead. Yet, with all this, he was going to keep guard in the lonely summer-house beside the corpse of his friend, because he deemed that so doing was a proof of the love and friendship he had ever borne him; and the signor marvelled that the poor fellow had not at least asked some person to keep him company in this mournful vigil. This discourse led to a discussion of the notions entertained by the peasantry respecting the struggle of the good and evil angels for the spirit of man as it left its mortal tenement; and the conversation suggested ideas to the Signor Giulio Mercadante which were infinitely tempting to a practical joker. Forthwith he summoned Pietro, one of his serving-men—a fine soldierly-looking fellow, not at all unlike the deceased Baptista in person, but very dissimilar to the poor watcher, Francesco, in character, being a boastful scoffer at all belief in the agency of the invisible world.

'Here, Pietro,' said his master, 'would you in guerdon for small service like to earn this?' And he held up delicately by the fore-finger and thumb a silken purse, through the open network of which there glittered several silver coins.

'Say but the word, signor,' replied the man, 'and the purse shall be mine!'

'Hark, then!' said his master: 'you know that some vile assassin has given the deathblow to my poor Baptista, who is even now stiffening on his funereal couch in the summer-house; and you know, too, that his comrade Francesco keeps him company?'

The man acquiesced by a bow.

'I should like,' continued the Signor Giulio, 'to cure this simple Francesco of the foolish fancies he entertains respecting the dead: it might make him a better servitor for the future. I care not to have one in my train who starts at shadows after nightfall, though he be valiant enough in the broad daylight; and for this I want your wit and aid.'

Pietro grinned from ear to ear in anticipation of what was to follow. He had had some experience in similar freaks since he had entered the service of the Signor Giulio Mercadante.

'You are not afraid of the dead?' questioned his lord.

'I, signor!' said Pietro, as he curled his moustache. 'Many a time have I couched me on the battle-field with none but the slain beside me; and methinks if the dead could ever give cause for dread, they would do so at such a time and in such a place. But, tush! they were as incapable of moving as the soil on which they were stretched.' And he snapped his fingers above his head as he spoke.

'Then,' said his master, 'you will not hesitate to take the place of Baptista for this night, and to play the part of a dead man?'

'Signor!' said the puzzled servitor.

'This,' said the signor, 'is what I require of you—simply to lie motionless and stiff in his stead, to deceive Francesco. Mark well what he does; and when the

bell tolls midnight, rise up in your bed, and call him by name.'

'I will do it!' said Pietro, rubbing his hands in anticipation of the scene. 'Poor Francesco, he will be scared to death! Ah, we shall have a joke against him for life!'

'But,' said one of the guests, 'have you considered that upon this night, above all other nights in the year, the powers of the air have influence on man; and that Baptista whom you will thus represent led a most wicked life?'

'Tut, tut, my lord!' said Pietro — 'all old wives' fables to scare women and children!'

When the door had closed upon him the guests unanimously expressed their doubts as to the actual scepticism of the fellow.

'Well, let us try him!' said their host, who now fairly found himself in his element, and who with his friends hastily set to work to dupe both Pietro and Francesco.

Two of them proceeded to the summer-house, where they found Francesco keeping watch by his friend's body, and telling him that his master desired his presence, they removed the corpse during his absence, and placed Pietro upon the funeral couch.

Night was drawing her sable curtains round the earth when Francesco returned with a cigar, a bottle of wine, and some old journals, as aids to enable him to pass the night with composure. He placed the table at the farther end of the room, with a lamp upon it, and sat, it may be well believed, with his back to the couch. He tried to become deeply interested in the journals: in vain—his eyes saw the characters, but these would not impress themselves on his brain. Now and then, but evidently with an effort, he turned his head slowly over his shoulder to steal a glance at the supposed dead man; and often he started, and nervously glanced round the room.

All this for a time served highly to amuse the stiff and motionless Pietro; indeed he would have willingly given vent to his laughter, the more so as he dared not; and this inclination gave him a tickling sensation in his throat, which cost a superhuman effort to repress it. What relief a cough or a hem would have given him!

Then after awhile he became weary—the remaining perfectly still for so long a time was a far more difficult task than he had imagined; and in order to nerve himself to the endurance of such a part to the end, he had to bear in mind not only the glittering purse, but also that mocking incredulity which he had seen so legibly impressed upon the faces of his master's guests. 'No,' he thought, 'were I to fail they would attribute it to unwillingness to remain in the dead man's place at midnight, and not to this irrepressible feeling of restlessness.' So he persevered. A blessing it was to him that the plotters had drawn the mosquito curtains in full and ample folds around him; for he could open wide his eyes, he could pout his lips, put out his tongue, stretch the muscles of his feet, or elongate his legs to their greatest tension, or press the hands crossed upon his bosom, without much fear of detection. Once or twice indeed Francesco had turned sharply round, but after an awfully-scared look he had apparently become convinced that the movement had only been fancied by him, or was caused by the fluttering of the light on the distant couch, and he had again turned to the perusal of the journal. But the stillness was far worse for the imposter to bear than the visible indications of Francesco's inquietude. It gave him the fear of falling asleep: if he did, he should assuredly snore; and then there would be a forfeiture of the purse, and the laugh would be against him instead of his dupe. But the temptation was very strong: the bed, the gloom, the stillness, the tic-tic of the timepiece, the rustling of the journal as its leaves were turned over with a peculiar lulling sound—surely never was mortal so tempted by external

objects to turn upon his side and enjoy a good nap. He was fain to pinch his skin, to keep himself awake.

The timepiece struck half-past eleven. Another half hour more must he suffer such purgatory; and how fervently he wished that just for a few minutes in that term the journal would prove a soporific to Francesco, and allow him the opportunity of easing his cramped frame!

Now, had poor Francesco been really thinking of the journal, it is ten chances to one that he might have slept; but his thoughts were wandering despite his will. He recalled those scenes in which he had stood side by side with the murdered Baptista—scenes of robbery, of violence, and even bloodshed. He divined full well who had given the deathblow to his old comrade—that it was one of those former associates who never forgave a desertion from their band, and whose vows of vengeance were always kept. But how had they hunted him out? Then there came the conviction that he too was a marked man; and somehow with that conviction there flashed across his mind doubts of the old woman who had laid out Baptista for burial, and who seemed so perfectly acquainted with his former life. He too well knew how many agents among the poor the robbers could command. What if information of his lonely watch should have been communicated to them, and that, in order to give facility to their purpose, he had been desired to leave the window open—advice given under the mask of superstitious fear?

These and similar conjectures chased one another through his brain, until he forgot his ideal alarms in what he considered more substantial causes for fear. Under their influence he rose from his chair and paced up and down the room.

Poor Pietro! No chance of movement for him now. He was obliged to close his eyes for fear of detection, so he could not perceive Francesco's next movement. He, following the current of his thoughts, examined a small pistol which he drew from his vest, primed it, and again returned it to its resting-place.

The timepiece struck the quarter to midnight: Pietro could not help it—he moved a little. Francesco started, sank into a chair: he glared upon the bed; but then there followed no movement—all was stiff, rigid, motionless! He took his handkerchief, wiped the clammy moisture from his brow, trimmed the lamp, and tossed off a glass of wine. The old woman's words recurred to his memory afresh: perhaps the warning, after all, was given in sincerity. He approached the window half-credulously, half-mistrustfully. He opens it. He places himself in the shade, and looks out; and soon his attention becomes so riveted upon what he perceives to be going on in the garden, that he forgets the corpse; or if there be some dim idea of its presence, it is only in connection with its being made the vehicle for his own destruction. Now all doubt of the old woman's treachery has vanished; for there, creeping within the shadows of the trees, or resting behind some statue, or stealing on all-fours by the fountains, come four figures, stealthily wending their way to the summer-house. He thought even he recognised the night-prowlers by their separate manœuvres.

In those few minutes Francesco was transformed from a timid coward into the bold, resolute man. He knew that it was mortal agency he had to encounter, and that he must trust entirely to his own arm for defence. He quietly and gently withdrew further into the shade of the room, and took up his position where he could command the open window, near which was placed the couch.

The timepiece struck midnight. As the last sound reverberated, there was an indescribable noise at the open window: a groan, mingled with the clanking of chains or the click of steel, and then a figure darkened

the entrance: it had come into the room. Francesco waited not to see who or what it was, but quick as lightning he levelled his piece and fired. With a piercing shriek the figure bounded upwards a few feet, and then fell upon the couch.

The three guests, who had little anticipated this termination to their folly, now shouting to Francesco, rushed into the room, where they found Pietro sitting upright in his bed, with eyes glued in an idiotic stare on the frightful object which was stretched across his feet, and to which he pointed, mumbling unintelligibly.

It was the Signor Giulio Mercadante, who, in a black robe, with flames daubed upon it, and horns and wings and glassy eyes, was now pouring out his lifeblood over the desecrated couch of the dead.

It was some time before Pietro entirely recovered the use of his senses; Francesco fled the country; and it may well be imagined that after this terrible lesson the three thoughtless guests never again attempted a practical joke.

THE EARTH'S ROTATION ON ITS AXIS.

THE ingenious experiment of M. Foucault of the oscillation of the pendulum as a test of the rotatory motion of the earth, which has of late so much occupied the public attention, has likewise served to bring the whole subject of the earth's rotation into discussion. It is strange to think that, not more than two centuries ago, this same subject occupied the attention of men of science and intelligence throughout the whole of Europe, and, we may say, the civilised world, though in a very different way. At the beginning of the seventeenth century, the doctrines of Copernicus, timidly divulged about fifty years before, were taken up by Galileo, and fully and boldly asserted. It took fifty years more, however, before they were even partially credited in Europe; and it is surprising to find the acute and learned, and, on the whole, very candid Sir Thomas Browne, even so late as 1646, denying his belief in such doctrines. In his 'Vulgar Errors' is the following sentence:—'Nor will it acquit the insatisfaction of those who quarrel with all things, or dispute of matters concerning whose verities we have conviction from reason, or decision from the inerrable and requisite conclusions of sense. And therefore, if any affirm the earth doth move, and will not believe with us it standeth still, because he hath probable reasons for it, and I no infallible sense nor reason against it, I will not quarrel with his assertion.' Now the somewhat quaint Sir Thomas was a thinker and writer in many respects far ahead of his times, yet he was on this question behind Galileo and his contemporary countryman, the immortal Milton. In his denial, however, he is not dogmatical; not so his commentator, Sir Christopher Wren, dean of Windsor, and father of the celebrated architect of St Paul's. He denounces the new doctrine with vehemence, and without any reservation whatever, and may well be taken as a type of the prejudiced and ill-informed objectors of the time, as well as of all times, to any doctrine which disturbs the still quiet of old-fashioned and long-received opinion. It is amusing, and in some respects edifying, to glance over the various objections propounded in those days against the earth's rotation on its axis, and its annual revolution round the sun. If the earth rotates with such a velocity, say they, a stone thrown up into the air should be left a far way behind; and so should the air or atmosphere itself, and especially the water of the ocean. Now, to some extent the two latter at least of these phenomena do take place, but not in the way which the objectors suppose. In a general way the atmosphere and the ocean revolve as part and portion of the solid earth, and even the stone 'thrown up into the air' still continues to preserve its motion as a particle of the earth, and rather falls to the eastward

than to the westward of its point of projection. But the chief objection was a scriptural one; or rather a list of eighty contradictions from the Scriptures. Turn up a volume of Sir John Herschel, or any celebrated astronomer of the present day, and we shall readily find eighty such objections. With all our knowledge of the earth's rotation, we still speak of the sun 'setting and rising,' of the 'motions of the stars,' and the 'sun's course in the heavens;' in short, we still find it most convenient to use the language of the senses, not the intellectual language of the reality; and throughout the whole of Scripture nothing more is done than this.

The diurnal revolution of the earth is now one of those received and established facts which demand no proof. Abstracting our thoughts for a moment from the incongruities between vision and relative motions, we can at once discover, from watching the position of the sun, that we travel continually in this latitude at the rate of 500 to 600 miles per hour; or at night, fixing our eye on the moon, that we far outstrip her in her progress through the deep blue sky, though she also has her eastward course, as may be demonstrated by fixing on some far-distant fixed star, when we shall find that during every passing hour and minute both the moon and earth recede, though with very different velocities, from the tiny, twinkling orb.

We owe to one of England's most celebrated astronomers of former days, Dr Halley, the first true exposition of the atmospheric currents. He first pointed out that in a current of air coming from the pole to the equator, there is a much less lateral velocity in high latitudes than in low; or, in other words, while the air at the equator is carried from west to east with a velocity of 1000 miles an hour, the air within the polar circles only moves with a velocity of 100 or 200 miles an hour, diminishing almost to nothing at the pole itself. From this circumstance arises the well-known direction of the trade-winds north and south of the equator, which, instead of blowing directly north and south respectively, acquire a direction of north-east and south-east. This circumstance, once ascertained, is perhaps one of the most self-evident proofs of the rotation of the earth—a proof not liable to the deception of vision, as many of the others are, but which can likewise be appreciated and confirmed by the other senses. When a current of cold, and consequently heavy air presses from the polar regions towards the equatorial, every degree it advances it comes over a portion of the earth that is revolving eastward at a greater velocity than that part which the current first left: when it arrives within the tropics, the earth's motion is from 900 to 1000 miles an hour, the motion of the wind-current is perhaps one-half less than this. The consequence is, that the earth outstrips the air-current, which, so to speak, is left behind. Now, we know that in travelling on a railway with a velocity of thirty miles an hour, if the air is not moving at all, we encounter a wind blowing at the rate of thirty miles an hour, forming a stiff breeze; but say that there is a gentle current blowing along with us of fifteen miles an hour, still we outstrip it, and create for ourselves a counter-current with half the velocity, or fifteen miles an hour.

Did the earth, then, not turn on its axis at all, the trade-winds ought always to blow due north and south respectively on each hemisphere.

The experiment of Foucault is, we presume, so well known to our readers, that we need not enter on it here. It derives its interest, as a proof of the earth's rotation, from the well-ascertained fact, that a pendulum continues to rotate in the same plane in which it has been set in motion. From this circumstance, and having a free motion at the point of suspension, it preserves its original plane of rotation while the point of suspension, and consequently the part of the earth's surface

where it is placed, is making a daily revolution. This simple, ingenious experiment has also the merit of affording a proof, free from the fallacy of vision, of the earth's daily revolution on its axis.

THE UMBRELLA PEDLER.

THE trade in second-hand umbrellas is one which is very industriously pursued in every part of the metropolis, although in seasons of dry and fair weather no trace or indication of it may be visible to the most experienced observer. The fall of the barometer, however, lures the hawkers from their hiding-places, and, simultaneously with the pattering descent of the first smart shower of rain, they may be beheld, if not numerous as frogs on the windward bank of a dry pond, yet vocal as their saltatory prototypes, and, like them, rejoicing in the blessed dews of heaven. In them the forgetful pedestrian, who has left his umbrella behind him, encounters accommodating friends, ready to dispense a shelter at any price, from a 'tanner' to a 'bull,' as they phrase it, or from sixpence to a crown-piece. In the neighbourhood of some sheltered court or covered archway, where the crowd have rushed to covert from the rattling storm, the umbrella pedler takes his stand—his back to the breeze, his battered frock buttoned to the chin, his blucher-booted feet firmly planted on the slushy pavement, and his burly figure effectually shielded from the assaults of the tempest beneath the ample dome of gingham upheld in his sturdy fist. With a dozen or two of serviceable umbrellas of every possible colour and material gathered up under his left arm, he stands erect and scornful of the inclement sky; and as you shrink from the driving sleet or peppering hail, jostling uncomfortably with 'damp strangers' beneath the crowded covert, he pits his patience against yours, pretty sure to conquer in the end, unless the heavens prove adverse, and the beams of the returning sunshine put his mercantile prospects to flight. He is an admirable prophet of the weather, and knows far better than did Murphy when the clouds intend to drop fatness. When you see him emerging, stock in hand, from some malodorous alley in the purlieus of Clare Market or Drury Lane, you may set it down as a matter of certainty, whatever be the promise of the hour, that he has derived from some mysterious source or other infallible indications of impending moisture, and that he is prepared to take advantage of it. A sudden change to wet occurring at eight or nine o'clock on a summer's evening is a special providence in his favour, adding 50 per cent. to the value of his goods, and insuring a certain and rapid market for them. He is off at such a crisis without loss of time to Vauxhall, or Cremorne, or some other popular resort of out-of-door entertainment, where thousands of callow Cockneys, who piously believe that to carry an umbrella is to invite wet weather, are to be found fluttering in their Sunday's best, and in the precise condition he would have them for the encouragement of trade. The disengagement of Exeter Hall after a May meeting, or an Oratorio by Handel, during a summer storm, is a harvest which he is sure to be on the spot to reap. Wherever, indeed, a crowd is caught in the rain he is present to catch the crowd, and on such occasions, it need hardly be said, is pretty sure to be well received and well remunerated.

When fine weather has fairly set in, our moist friend disappears from his accustomed stations, and if, as it ought to be, his stock be greatly diminished, he has now the task of replenishing it to perform against the return of the wet season. With this view he makes the tour of London on a principle peculiar to himself: avoiding all the main and business thoroughfares, he penetrates into the back slums and private-door districts, where, in a monotonous voice, reminding one of

the magician's cry in the tale of Aladdin and the wonderful lamp—a voice intended for the ears of servant-girls and peculating servitors—he bawls the interesting announcement: 'Sixpence for any ole humrellar!' Now as he sells hundreds of umbrellas in the course of the year at sixpence a piece, it is hardly to be expected that this announcement is to be taken in its literal sense. It means, in fact, that he will give sixpence for an article that he approves of. If you offer him a dilapidated machine, he will prove to you logically enough that, so far from being a (wh) ole umbrella, it is only a portion of one, and is therefore only worth a part of the price. He will buy it, however, at his own valuation, be it what it may, as he has ample means in store for supplying all deficiencies. If the relic in question be that of a genuine manufacture, with ribs of actual whalebone, and not the substitute of blackened cane, he will hardly let it escape him unless you are really inordinate in your demand. Umbrellas whose sticks and ribs are of iron are his utter abomination, and he tells you to bring them to him red-hot; he 'haves nuffin to do wi' them sort without the chill took orf.' It is not always that he pays for his purchases in ready-money: he carries with him on his rounds a dozen or two of tidy little parasols, not too large for a servant-girl to smuggle out of the house in her pocket, in cases where the mistress forbids her domestics the use of such vanities. When he has overhauled the goods he means to buy, 'Lookee here, my dear,' says he, 'if you got a mind to gi' me a bob (that's a shillin' you know) and these here three or four bits o' humrellars, you shall have an ansome parrysaul fit for arra lady in town, and take your chice.' With that he unfolds his tempting display of bright-coloured sunshades, and the bargain is only delayed till the dazzled abigail has fired her hesitating selection.

When he is sufficiently provided against a rainy day, and the wet weather, as is sometimes the case, does not set in to suit his convenience, he sets out on a repairing campaign. Furnished with a canvas or leathern bag strapped round his waist, and well supplied with ferrules, handles, tips, and all the little etcetera that go to the construction and reparation of umbrellas, together with a few simple tools, he perambulates the various suburbs and quiet streets of the capital, crying at the top of his voice: 'Humrellars to mend!' His ingenuity in the repair of any disorder incidental to the constitution of these useful articles is really marvellous. Your old companion in travel shall have had his brazen nose knocked off—shall have been actually turned inside out by the blustering assault of Boreas—shall have had the whole of his eight ribs wrenched from his spine, besides sundry other minor injuries—and shall yet emerge from the hands of this peripatetic bone-setter restored to his pristine integrity; hale, hearty, strong, and serviceable as ever—and all for the small charge of 'such a thing as tenpence.' In addition to what may be called his independent trade, carried on on his own account, he is bound by certain contracts to the keepers of retail umbrella and parasol shops. These contracts are not to him of a very profitable description: he has undertaken to do all the repairs required to be done—to medicate the wounds and fractures of each individual sufferer at a price comparable only to that at which a parish doctor is remunerated for attendance upon workhouse patients. Two shillings per dozen is the liberal allowance generally paid by the shopkeeper to the travelling artisan for the repair of umbrellas and parasols, lumping them all together, irrespective of the nature of the injury to be repaired. New coverings of course are not included, and the shopkeeper supplies such new handles as may be necessary: all the rest is furnished by the repairer. Some few of the more liberal dealers allow half-a-crown a dozen, which, seeing that sixpence is the lowest charge ever made for a single job to the public, and that the

generality of cases cost the customer a shilling, they can very well afford to do.

Sometimes a member of this fraternity will lay by his umbrellas and repairing-kit for a season, and betake himself to an analogous pursuit in the sale of walking-sticks. In carrying out this branch of his profession, he becomes the subject of a temptation to which he is not always superior. True he is a 'natty' hand at a walking-stick; and though he may not be, like Sir Plume, critically correct 'in the nice conduct of a clouded cane,' he is an admirable judge of the quality of canes in general, from the common chair-bottom bamboo to the costly amber-coloured Malacca. The perfection of his judgment in this particular has indeed been the source of the moral declension above hinted at. In his purchases of second-hand umbrellas, or perhaps in his barterings with serving-maids at gentlemen's back-doors, he meets occasionally with specimens of which the stick is a good partridge-cane. This, truth compels us to say, he invariably extracts (substituting a common one of beech), and dressing it up as a walking-stick, readily disposes of it as such at the price of a shilling or eightpence—the regular price for such a cane being from half-a-crown to three-and-sixpence. The purchaser soon makes the agreeable discovery that he has parted with his money to no purpose, and that his bargain, like most bargains, is good for nothing—the cane proving unsound, and snapping short at about a foot from the lower extremity. He sees when it is too late that his new walking-stick had done service as the rod of an umbrella—that it had been excavated at the part where it has now broken, for the insertion of the spring—that the wood had become rotten from the moisture collected there, and had consequently given way upon the first pressure. It is impossible to detect the imposture by examination before purchase—the cavity being cleverly filled with an imitative composition, and the whole subsequently varnished over.

Not a few of the ambulatory umbrella-merchants and menders are Jews, who are at all times ready and willing to exchange their wares or their skill for any portable species of marketable commodities. The writer many years ago took lessons in Hebrew from a travelling umbrella-mender, who read into such English as he was master of—he being by birth a Pole—any part of the Old Testament with the utmost ease and rapidity. He did the same with equal fluency with a Bible Society copy of the Hebrew New Testament, and plainly shewed, by his remarks on what he read, that the contents were entirely new to him.

No farther back than the 14th of last month, a picturesque-looking figure, stately and erect as a young oak, but grizzled with the frosts of near seventy winters, knocked with his knuckles at my window, as I sat tapping at the outer wall of my brain, to try if any ideas were within, and civilly requested to know if I had any umbrellas to mend. There was something in the man's face which forbade the abrupt negative that was already upon my lips: age, honesty, suffering, and something besides that is indefinable, compelled me to comply with his desire. He was clad in a garb which bore very solid pretensions to antiquity—smooth and shining with the unctuous friction of years, yet carefully stitched and mended throughout. I judged him to be an old soldier; and, mindful of the tale of the 'ancient mariner,' I found the means of setting him to work upon a job which occupied him for three-quarters of an hour, during which, in compliance with the inquiries I plied him with, he delivered himself at intervals to the following effect:—

'This here's a French humrellar: I know'd he was a Frenchman afore I laid hold of him. I knows the make of that sort well enough. Ha—I reklect the time when we used to get five or six-and-thirty shillin' for a good silk un. Free-trade in humrellars and free-trade in bread! Well, one tells up agin t'other, I's'pose.

I had a pretty good taste of the French once in my time.'

'Have you lived in France?'

'Four year two months and twenty-seven days.'

'You have kept a pretty exact account. I hope you enjoyed your sojourn there?'

'Not a bit of it; bein' I went there again' my will, and was a prisoner of war pretty well the whole time.'

'Pray, how came that about?'

'Why, you see 'tis more nor forty years agone now—full that since I first went and listed in the army. About the end of 1810 I were servant to an officer, and sailed with my master from Lisbon to join the garrison of English and Spaniards as lay beleaguered by the French in Cadiz. I was unfortunately took ill of a fever the very day as I stepped aboard, and confined to my berth all the voyage. Having the weather again' us, we were sixteen days at sea afore we came in sight of the Isle of Leon. But we never got there: a bad storm druv us ashore full ten miles or more to the west of Cadiz, and we was wrecked. While all hands was trying what they knowed to save the crew and transports, the French kept firing on us all the time.'

'Are you sure of that? Such cruelty is not customary in civilised warfare.'

'I says nothin' but what's true. You see we had been driving in the storm under bare poles, and hadn't got a flag to strike; so that we couldn't shew no surrender: besides, 'twasn't the reglar French army as took us, but a gang of irreglars as worked on their own account again' the British. The want of a flag to strike cost us a good many of our men killed by their shots. There was a good many sick besides myself, for the fever had spread a good deal on board; and when the enemy seen our hands a-gettin' the sick men out in their hammocks, and lowering 'em into the boats, they left off firing; and though they didn't offer no assistance, they allowed us to land as well as we could. We all got ashore pretty nigh, but every one on us was made prisoners to a gang of fellows made up of the raff of all nations—French, Italian, and Irish volunteers for the most part—fighting for the sake of prize-money under the patronage of Marshal Victor. They forced the Portuguese sailors, and a lot of our own fellows too, to bear a hand in plundering the vessel; and when they had got all they could out of her, they set fire to her. I see her blow up as I lay shiverin' in my hammock under a ledge of a rock in the middle of the night. I was dreadful bad for a long time while we lay in prison that winter, wi' nothin' better than straw for a bed, and that most times wet. They turned the sick out of their hammocks, and bundled us all together upon one heap of rotten straw. But our lads stood by one another, and my master done what he could to have me took care of, though he could not come and see me. As the spring come on I got better, along o' many more; though some of the poor fellows died just when they should have got well for want of warmth and nourishment. The Frenchmen wanted us to work in the trenches, and we might have got out of prison if we would ha' done it. But that didn't suit us, and we were allowed to decline it, preferring to be marched off to prison to France. If I was to live for a thousand years—which, thank Heaven, I shan't—I shouldn't forget that there miserable march. We was seven months on the route, sometimes a target for grilly fighters, who never shewed their faces till they sent a volley of shot among us—sometimes short of victuals and water—sometimes camped for the night on the top of a frosty rock without a bit o' coverin' beyond our own flutterin' rags. There was ne'er a bit of shoe or stocking among us by the time we had been a month on the route—no change o' linen—no victuals fit to keep the soul in a man's body—and no bed to lie on arter the horrible fatigue of a march wi' bare

feet over a mountainous country. Many times we was all druv together into a hole where half on us couldn't lie down at once. A good number of the prisoners got so badly knocked up on the road before we had crossed the mountains, that they was forced to be left behind, where some died, and some got well, and was exchanged, and joined the duke's army. If it hadn't been a little better travellin' in France than it was in Spain, I'm pretty sure I should have left my bones there. We marched all through France into French Flanders. When at last we got to Cambray, there wasn't much more than seventy of us out of wellnigh two hundred that escaped out of the vessel. My master was left behind on parole, and was exchanged, and, worse luck for me and him too, poor man, was killed in battle before I got my liberty. 'Tis a bad thing to go to prison, but 'twas the happiest day of my life, 'cept the day as I got out, when I first got into the prison at Cambray, and had a good bed of clean straw to lie upon, and a mouthful of decent victuals to comfort me. I stayed here near three years, and, considerin' all things, wasn't very badly off. My master, while he lived, didn't forget me, and through a French officer as he had made his friend, I got many indulgences and many a good ration from the governor. Perhaps I might have broke out o' prison, and found my way to the coast, as some of my comrades did—though whether they ever reached home I can't tell—but it wouldn't have been handsome in me to return the kindness of the governor by giving him the slip. There came a release for us all when Bonny had lost the game.'

'Did you get pay for all the time you were in prison?'

'I did; every penny of it, and spent it, like a fool, in double-quick time.'

'Was that the end of your soldiership?'

'No. I was transferred to the 21st, and before the end of the year had landed on the shores of the Mississippi, where I got into a worse mess than the tother.'

'You mean the affair of New Orleans?'

'I do—I was in it. There ain't much talk o' that in England. 'Twas a shameful bad business.'

'It was a fearfully fatal one to the British.'

'All owin' to stoopid management, sir—nothin' else. We should ha' done the business proper enough if we'd a been well officered. Our generals thought, I s'pose, that we could all eat up half-a-dozen 'Merricans a-piece; but they took care we shouldn't get at 'em, by leaving the scalin' ladders behind. So there we stood at daybreak, close up to their heavy guns, while every shot riddled us through. As it was, we might ha' stood some sort o' chance if we'd a been brought up in line; but in close column as we was, thousands of our men was cut down in next to no time. I hadn't been standin' there three minutes afore I could awalked over the muddy canal in front of us, which was about four foot deep, on top o' the dead bodies o' the 44th. I could see an old nigger, not twenty paces in front, grinning at us wi' his white teeth through the fassins, and cramming heavy bags of musket-shot into the muzzle of a thirty-two pounder, and sending certain death to hundreds at every discharge. I would have gave my two arms to have got at the leering devil wi' my teeth. I see Paknum killed by a rifle-shot, and I was druv myself, wi' a lot more, smack agin the fassins by the rush o' the 93d Highlanders, who scrambled over us into the enemy's works; but not a man of 'em come back to tell what luck he found there. We stood there till more than half of us had nothing to stand on, and then Lambert ordered the retreat to be sounded. It made me sick to stagger back through the piles of dead and dyin' men, whose brave lives had been fooled away from the want of a little common prudence. If we had been led on by a 'Merrican, we should ha' done just what we did do—that is, walked into the jaws of the very trap that had been so long getting ready for us. Our bad

management, and the want of a little respect for the enemy, cost us some thousands of lives, and spiled the success of Colonel Thornton, who carried the battery on the tother side o' the river, but was also obliged to retreat, because the whole force was blown to pieces, and there was nothing left to back him. If we had mastered that battery before we did anything else, and reduced the town first on that side of the water, we should have had a different tale to tell about New Orleans at this time o' day. After all, the 'Merricans had no pluck. They might ha' druv us into the river if they had the sperrit to come arter us. They had more than ten thousand men, and we was reduced to two thousand effectives; but they let us retreat in order, with guns and baggage, to our vessels fifteen miles off. That scan'lous affair was the first and last of my military service in 'Merricy. Soon arter that the peace was made, and I got my discharge, along of a bad roomatiz picked up through campin' in the swamps of the Mississippi.'

'Of course you have got a pension?'

'No, I han't—no pension, nor no medal, nor no nothin'!'

'How comes that about?'

'I can't tell 'xactly. If I harn't got it, 't aint for want of asking for it. But it seems I didn't take steps as I knowed nothin' about. If I'd done a sartin thing at a sartin time, they tell me that every two years of my service would ha' counted for three, and then the government would ha' had a right to ha' made me a pensioner. They are very sorry, of course, and so am I; but it can't be helped now.'

'It is well, then, that you have a resource in your trade. I suppose you learned that after your discharge?'

'No, I didn't, sir. I served my time regularly to the business in that very house that fell down the tother day in Graysher Street, and killed poor Hoolagan, and more besides. Here's your humrellar, sir; I must charge you nimepence for it, and hope you won't think it too much. You see I have new-tipped all the bones, put on a new ferrule and new cap, repaired the spring, and fastened the handle, which was loose.—Thank'ee, sir—much obliged—proud to do anything for you, sir, at any time. I often comes round this way; if you'd lay by any little jobs for me, sir, you won't say I does 'em badly, sir, or overcharges.'

Exit old soldier, carefully closing the garden-gate after him; then, making a speaking-trumpet of his hand, slowly marching off to the tune of 'Humrellars to mend! AINY humrellars to me-c-e-end!'

THE 'INDEFATIGABLE WODROW' AND HIS COLLECTIONS.

THERE are few readers of history who have not heard of 'The History of the Troubles of the Church of Scotland from the Restoration to the Revolution:' a book which has had the rare good fortune of being liked and praised even by those who are thoroughly hostile to its author's opinions. In fact, though Wodrow is a prejudiced, one might almost say a violent partisan, yet there is so much singleness of purpose and genuine honest enthusiasm throughout his writings, that people are inclined to pardon his thorough onesidedness. All he has stated is not true; for he was credulous: but then he had the great merit of never stating anything he did not believe. He has thus often been relied on even by opponents in statements bearing against their own side when they saw that he had sufficient evidence. They might distrust his judgment, but not his honesty. His industry procured him the character of 'The Indefatigable;' and some notion of its extraordinary extent may perhaps be formed from the present sketch. The objects of his labours were pretty multifarious, but they all had a sort of tendency towards one darling end—the illus-

tration of the persecutions and perseverance of the Church of Scotland during its time of trial. Though he himself belonged to it in the days of its prosperity and power, and was a flourishing and influential man, yet there were a sufficiency of incidents in his family and infantine recollections to bring vividly before him the perils and anxieties of the time. Among these nothing could be a more startling memorial than the circumstances attending his own birth; and no one who knows the story can wonder that the child, often hearing it told at the more secure and cheerful fireside of peaceful days, should have been deeply imbued with the tone of these thrilling events.

His father was one of the covenanting clergy who would not agree to the regulations of Charles II.'s government, and performing their worship in remote places among the mountains and forests, came under the proclamations against conventiclers or field-preachers. He was obliged to abscond from his house in Glasgow; but when his wife's hour of peril was at hand—she being disturbed by a presentiment that she would not survive the event—her husband made a perilous effort to see her. Though it was night, and he had disguised himself to the best of his ability, he was recognised as he passed 'the guard-house in the Trongate,' and his destination being easily guessed, a party was sent to his house to search for him. Delicacy kept them from the sick woman's room until every other possible corner had been searched, and they were about to make this conclusion of their search, in considerable certainty of finding their victim, when the arrival of the physician, Dr Davidson, suspended their proceedings. He came attended by 'a man-servant with a lantern carrying before him—it being now night—and the soldiers allowed him to go in with his servant when he told them his errand.' The military party still watched the premises, and it was during this interval of suspense that the historian of the troubles was born. The mother's life appears to have depended on the safety of the father, and the worthy physician found that his best prescription would be, if possible, to rescue the fugitive. The son thus describes the incident in a memoir of his father: 'A method offered to the doctor, which proved effectual through God's goodness for his escape; and he proposed that my father should change coats with his servant—a pretty large man—and put on his bonnet, and briskly take up the lantern, and go out before his new master with all the assurance he was master of. The thing took; and the soldiers having seen the doctor come in just now with a servant, when he went off let him pass without observing the matter. In a quarter of an hour or thereby the captain returned and searched the whole house, and my mother's room, with the greatest care; so that they stugged with their swords the very bed my mother was lying on, jalousing he might be concealed there. My mother was now easy, do as they would, and told them with much cheerfulness the bird was flown, and they needed give themselves no farther trouble.'

So began and terminated all that could be called adventurous in the career of Robert Wodrow. The child who entered the world at a moment of such wild excitement and peril was to lead a quiet, prosperous life, devoted to his ministerial duties in the pleasant rural parish of Eastwood, and to his literary labours and collections. He had no farther troubles save theological controversies in his own church, and save annoyance suffered from the remaining Cameronians. Of these, his chief worldly source of trouble, he says, on the occasion of his having, contrary to their tenets, observed a government fast: 'Instead of the converse I some time a-day had with exercised Christians about their own spiritual case, I was engaged in disputes about the public and about separation, and how to defend the lawfulness and duty of hearing me preach

the gospel, and for the most part to no effect. So that many a time it was a terror to me to go out among them; and coming to particular places, I often looked very blunt, finding myself beset with contemners of me and my ministry, who often kept not within the bounds of common civility.'

The collections made by Wodrow are in some measure dispersed: a portion, chiefly biographical, is in the University of Glasgow; others are in ecclesiastical libraries, and in the possession of private individuals. But the largest and most valuable department is in the Advocates' Library, where its extent and variety is a wonderful testimony to the collector's diligence. The circumstances which brought so large a portion of them to light are interesting. The many manuscripts scattered here and there, which were either in Wodrow's handwriting or bore marks of having been in his possession, prompted the Rev. Dr Burns—his descendant, we believe—to institute a general search, for the purpose of bringing all that could be found to light. 'With the valuable aid,' he says in a letter to the editor of Wodrow's *Analecta*, 'of Mrs Wodrow, grand-daughter of the historian, who had a good many manuscripts in her own possession, and who gave me useful hints as to the probable resting-places of others, I succeeded, partly by domiciliary visits to garrets and other repositories where these exuvie had remained for a series of years undisturbed, and partly by corresponding with surviving relatives of the historian, in unkenning from the dust of years some fourscore volumes of various sizes, and almost all in excellent preservation.' One portion of the collection was of use only to a peculiar class of students. It consisted of 'lectures, sermons, homilies, and other compositions of a similar class, by the father of the historian, the historian himself, his brother Alexander, several of the worthies of the covenanting age, and many of the theological students under Professor Wodrow, from 1690 to 1707.' Forty volumes, containing matter of more general interest to history and literature, were transferred to the Advocates' Library, where, along with several others, they constitute 'The Wodrow Collection.' A considerable portion of it consists of the historian's correspondence. He preserved and bound up the letters addressed to him; and having an equally good opinion of his own, he copied them, in his peculiar, compact, square hand, into volumes. Three volumes are still in existence; another, the earliest of the series, has been lost sight of. His writing is as close and compact as small print. The three little volumes contain about six hundred letters, and some of them by no means brief. But all that is worth knowing of his own personal correspondence is now pretty accessible in one of the publications of the Wodrow Society. This is one of the book-clubs which have lately sprung up. It was instituted in May 1841, 'for the publication of the works of the fathers and early writers of the Reformed Church of Scotland.' It was very worthily named after one who had worked so amply in the same field; and besides his biographies of eminent clergymen, of which he wrote many, the society printed his correspondence in three octavo volumes.

The miscellaneous documents in the Wodrow Collection cover a very wide field. A catalogue of them fills a considerable volume, and one wonders how a country clergyman could have got such papers into his possession. Many of them were connected with the great civil wars; and one might turn over a despatch with a reference to 'Oliver Cromwell, Esq.,' on which the sand still adhered, or a letter from the unfortunate Land, which sometimes puzzled the reader with its signature of 'Gul. Kant.'—a contraction of Gulielmus Kantuariensis—William of Canterbury. Some portions of the Collection go over still more distant ground, as popes' bulls, minutes of catholic councils, foreign diplo-

matic negotiations, and the like. Many of the papers are copies made in Wodrow's own peculiar, square, regular handwriting; and the extent of these alone, besides his collections and original writings, might have entitled him to his designation of 'The Indefatigable.' Among the most curious of his copied manuscripts is Lord Ruthven's relation of the murder of Rizzio. This strange, characteristic account, though it has been more than once printed, is scarcely known to general readers. There have naturally, notwithstanding its picturesqueness and air of reality, been doubts of its authenticity; but Wodrow's painstaking preservation of a copy is something in its favour. It is a strange piece of brutal ruffianism, and curiously illustrates the manners of the court and aristocracy of Scotland in that day. According to his own account, when the conspirators burst into the apartment, he called out, 'That it would please her majesty to let yonder man, Davie, come out, for he hath been ow lang there!' The purpose for which Davie was thus courteously asked out was that of being killed. The tragedy is described; but almost more characteristic than the deed of violence is the coolness of the ruffian after it is over. 'The said Lord [Ruthven] being so enfeebled with his sickness and wearie of his travel, that he desired her majesty's pardon to sit down upon a coffer, and called for a drink for God's sake! So a Frenchman brought him a cup of wine, and after that he had drunken, the queen's majesty began to rail against the said lord—Is this your sickness, Lord Ruthven? The said lord answered: God forbid that your majesty had such a sickness! for I had rather give all the moveable goods that I have. Then said her majesty: If she died, or her bairn or common-weal perished, she should leave the revenge thereof to her friends to revenge the same upon the said Lord Ruthven and his posterity; for she had the king of Spain her great friend, the Emperor likewise, and the king of France her good brother, the Cardinal of Lorraine, and her uncles in France; besides the Pope's holiness, and many other princes in Italy. The said lord answered, that these noble princes were over-great personages to meddle with such a poor man as he was, being her majesty's own subject,' &c.

Besides the manuscripts there are endless thick volumes of printed pamphlets in the Advocates' Library, collected and bound up by Wodrow, each volume having at the beginning a catalogue of its contents in his peculiar handwriting. They are of great value as containing a mass of that sort of fugitive literature which lets us into the secret history of the times, but is so apt to be lost unless there happen to be a zealous Wodrow collecting and arranging it. Undoubtedly, however, the most valuable morsel in the Wodrow Collection consists of six stumpy volumes carefully written in his own hand, each with an index. The title at the commencement of the first volume is 'Analecta; or Materials for a History of Remarkable Providences, mostly relating to Scotch Ministers and Christians.' It is partly written in a sort of contracted or secret hand, as if he wished no one to read it—at least all of it—but himself. In this design, if he entertained it, he has been defeated, since the 'Analecta' have been as completely deciphered as the far more difficult diary of Samuel Pepys, and have been found to be a scarcely less curious and amusing book. This has been printed in four stately quarto volumes; but to the public at large they are still much the same as if they were in manuscript, since the impression is limited to the members of the Maitland Club of Glasgow.

The leading feature of the 'Analecta' is the author's credulity, and the strange, grotesque narratives in which it leads him to indulge. Though the remarkable events mostly relate to Scotch ministers and Christians, and they were doubtless collected for purposes of church history and biography, yet there are

divergences in all directions, and especially into natural history, if what is altogether supernatural can admit of that name. In one place we have the marvellous consequences where a 'corby bigged in a tree at Balmaclellan, and the Laird of Home, a brisk and venturesome young gentleman, went up and with danger climbed the tree, and took out the eggs, and boiled them hard, and put them again in the nest.' We are sorry to be obliged to tantalise the reader, but the consequences of this anomalous act on the population of Scotland were of a kind which cannot well be told to the polite ears of the present day. Immediately after it comes another natural-history anecdote which will better bear telling:—

'The same person tells me another account which he had from a very sensible gentleman about four or five miles from him. There is a rock beside a loch where the earns or eagles do bigg. There was one part of it very convenient, which a corby or raven chose to bigg her nest in. Within a while one of the earns came and dispossessed her. After some struggle for some days, at length the corby went off, and was not seen for several weeks—ten or twelve. At length the corby came back with a little bird with it, about twice the largeness of a sparrow, and waited and hovered about the place. One day the gentleman observed, and the earn is coming out of his nest, and the corby attacks him, and the little bird joined. And after some time's struggle, and the bird striking below the earn at her breast, he observed the little bird strike with the side of its wing at the neck of the earn. At length, after several misses, it struck off the earn's neck as if it had been done with a razor, and the neck and trunk fell down to the earth, with a little feather, which he took up and supposed was the instrument of cutting! It was very stiff, and sharper than a razor, and full of blood.'—(*Analecta*, iii. 88.)

The 'Analecta' are strowed with ghost-stories, some of them very picturesque. There is a long and somewhat tedious description of the troubles suffered by the inmates of a haunted house, the ghostly persecutor of which appears to have been a person of a very substantial kind. 'The family were mostly disturbed in the night-time, and that by unaccountable knockings on the bed, as if done with a great hammer or axe, as if one were dinging it all in pieces; by throwing down of all the pewter vessels in the kitchen, making a great hurling noise, and yet on the morrow morning they find the vessels all in the order they were in before.' The ghost advanced to the still further insolence of seizing the young lady of the house, 'and beat her severely, so that she could not get any rest for several nights.' In winding up the narrative he says: 'Upon one of these days, a servant-man that belonged to the family, as he was at his work in the field, happened to say to the rest of his neighbours that were shearing with him: "Lord be thanked, the ghost has not troubled us this last night!" He had no sooner spoken this word than he got a severe pelt on the back with a stone, thrown at him from some invisible hand, which they all observed to rebound off his back on the ground, and some of them took it up.' A little farther on is a very Highland-like incident of one seeing a vision of a friend with a dirk sticking in his breast. That night he was stabbed by a tinker, whom, as a magistrate, he had punished.

The 'Analecta' contain many anecdotes of distinguished men, not less marvellous than the other portions. Is it possible to believe the following told of Andrew Marvell and Harrington?—

'That Marvell and the advocate [Sir James Stewart, lord advocate] were great comrades to Harrington, the author of the Oceana. That Harrington had this particular fancy, that the flees that were about him were all procreated by the heat of the sun out of his body, which weakened, and would at length destroy

him! One day discoursing with Marvell on the head, since no reasoning would prevail with him, he advised him to this experiment: to cause make a little cabin of timber, with the one side glass and the top glass, as close as could be, and enclose himself there, and let the sun beat on him; and when all was close, if he observed any flees there come out of his body it was weel; if not, then to cast off the prejudice! The machine was made, and Harrington and Marvell goes in. There is no appearance of flees. Marvell sat with him till, with its closeness and heat, he was almost suffocated. On which he went out, and came directly to the advocate and told him the story, complaining that he was a greater fool himself than Harrington, who continued still in the imagination, saying he did not know but something in the machine might then hinder flees coming out of him.

RAMBLES IN SEARCH OF WILD-FLOWERS.

AUGUST.

HAVING been prevented by the lateness of the hour from botanising the heath and hillside on my return from Daleage bogs, I resolved on taking the earliest opportunity of doing so; and therefore, shortly after that pleasant excursion, I again set forth on my donkey, and with my intelligent young companion, George the donkey-boy, whose ardour for flowers almost equalled my own. There was, however, this difference between us—that with him it was an entirely new pursuit, a passion taken up on the moment, and carried on in a state of profound ignorance, so that oftentimes he brought to me as wonders plants which he must have daily seen, but which, from his attention having never been directed to the subject, he had hitherto passed by unnoticed; whilst with me a love of flowers had 'grown with my growth and strengthened with my strength,' and from that root of love had sprung up a power of discrimination which had led to much pleasure and some knowledge. George's eyes were, however, in a measure opened, and I doubt not that the film has not again gathered over them, but that he will throughout life look on nature with a more enlightened and interested mind than he ever did before. And now that I am on the subject, let me suggest to those who are in the habit of country rambles, and are informed on any subject of interest, how much pleasure they might give, and how much knowledge they might impart, if they were more ready to communicate with others, especially with those below them in station. If you can succeed in drawing the attention of your donkey-boy, or the servant who attends you in your walk or ride, or of the cottage child who acts as your guide amid those rural haunts which you are in the habit of exploring, to natural pursuits, and allure them to search out and understand a little of those bright objects which surround them, and which you are yourself studying with interest, whether those objects be trees, or flowers, or birds, or shells, or fossils, you do them the greatest service. There is no need for giving them technical knowledge: much important and deeply-interesting information may be imparted without using one hard word or technical term; and by opening their eyes to discern beauties and detect wonders in those things which lie within their reach, but which have hitherto been shut out from them from the want of a little instruction, you supply them with a legitimate source of rational amusement and employment for powers and thoughts otherwise idle, and by so doing may in many cases be the means of keeping them from yielding to the temptations which besets vacant minds of finding amusement in scenes of

vice and folly. He who delights in a garden, in watching birds, in classing or collecting flowers or shells, or in any other country pursuit, is less likely to be found in an alehouse than he who has no such interests. By all means try to bring as many minds as possible under such wholesome influence, and never count it loss of time or of dignity to endeavour to point out the leading characteristics of the plants, or other natural objects they bring you, and their wonderful structure and uses; and in so doing you will have a good opening to direct their minds to Him who formed all these wondrous and beautiful objects for man's delight, and to lead them to 'look through nature up to nature's God.' Happy he of whom it may be said—

'He looks abroad into the varied field
Of nature, and though poor, perhaps, compared
With those whose mansions glitter in his sight,
Calls the delightful scenery all his own.
His are the mountains, and the valleys his,
And the resplendent rivers; his to enjoy
With a propriety that none can feel
But who, with filial confidence inspired,
Can lift to Heaven an unpresumptuous eye,
And smiling say: "My Father made them all!"'

By the time my excursions were over George was almost a botanist. He had certainly a new source of delight open to him, and one which, being easily gratified, I have no doubt beguiled him of many weary hours when, tramping beside his donkey, he would have otherwise been very dull. The day had been very hot, and continued so even after I had set out. I therefore abandoned the high road, which I should have otherwise followed, and diving into the shady lanes, soon found myself again following the course of the brook in its way from sweet Daleage. As I rode on I found that handsome species of the galium tribe—the wild madder (*Rubia peregrina*.) This plant seems to be confined chiefly, if not entirely, to the south-west of England and Wales, and abounds in Devon and Cornwall. Its long branches waving high and wide in all directions, like others of that family, are great ornaments to the hedges. The chief difference in appearance between it and the galiums consists in the hard, persistent character of its leaves, which grow from four to six in a whorl, are elliptical, shining, and smooth, with a fringe of sharp, short teeth, very thickly set at the margin. The stem is square and branched; the flowers of a yellowish green, in compound terminal panicles. (The panicle is a sort of loose, subdivided cluster.) The berry is black, and something like an ivy berry; but either it forms seed sparingly, or else the birds eat it early, for though the plant grows profusely throughout the district, I have seldom found it in fruit. Its long branches hang on the hedges all the winter, the leaves being then dead, brown, and dry. It takes its generic name from *Ruber*, red; to dye which colour some of the species are used.

The wall-pennywort (*Cotyledon umbilicus*) abounds in this neighbourhood, though marked as 'rare' by some authors. It is a singular plant: the leaf is thick, round, and very succulent, the stem being inserted into the centre like a nasturtium-leaf; it grows as low as the stone-crops, and from the root rises a purplish flower-stalk of from about eight to twelve inches in height, according to the amount of soil and sun of which it partakes. The flowers are pale, greenish-yellow little bells, arranged in a double row on one side of the stem, like the lily of the valley. One of the cottages at Knowle which I passed exhibits this plant in its greatest beauty, the whole thatch being ornamented with clusters of it, which have apparently grown there for very many successive years—the old decaying plants forming annually fresh pabulum for the crops of the succeeding year, until the whole has become one mass of verdure; the clear, semi-transparent

leaves and stems, with the bunches of tall, upright flower-stalks and delicate flowers amassed on it, giving to the irregular roof of dark thatch a most singular and beautiful appearance. The tops of thatched houses and sheds, as well as old walls, are very favourite habitats of the pennywort; and it is also often found bursting out from between the interstices of the red-sandstone rock which is so abundant in South Devon, on which it looks very handsome, as well as on the high banks which almost overhang our Devonshire lanes.

But if I linger thus amidst these most bewitching lanes I shall never reach my destination, so resolutely turning my attention from the alluring plants on all sides, I hasten Master Jack's pace a little, and turning to the right beyond Daleage Mill, I soon find myself on rising ground, and encircled by distant landscapes and near flowers, scarcely knowing to which first to direct my attention. A richly-undulating ground lies all round me, glowing with the gorgeous hues of the gorse and heath, now in their fullest bloom. To the right I see the mouth of the beautiful river Exe, and the pretty town of Exmouth just in sight. Multitudes of vessels lie in the harbour formed by the mouth of the river; and others, with their white or red sails glancing in the sunbeams, are dancing over the waves—some bearing gay groups of young people, with perhaps a guard of elders, for a happy sail on the bright water, and possibly conveying with them some poor invalid to enjoy the sweet scenery and reviving air after the exhaustion of a hot day. Others are freighted with limestone from the quarries of lovely Babbicombe and Petty Tor, those beautiful cliffs where whole hecatombs of madrepore seem to have been simultaneously caught and imprisoned in the solid rock, whence they are now hewn out in mighty masses, and formed into chimney-pieces, and chimney ornaments, and tables, and a thousand other decorations, for the habitations of a species of beings which had not yet been called into existence when these little half-animate creatures ceased to live. All is bright, all beautiful; and there, on the right, we catch even more noble views of the wide open sea, and of the range of white cliffs between which lie Sidmouth and Lyme Regis, and many other lovely little towns; and even in such a clear day as this we can perceive Portland itself, whilst right before is a wide stretch of heathy hill, interspersed with copses and plantations, and with broad fruitful fields reclaimed from the wild.

But now I turn my eyes and mind from the more distant beauties to the immediate object I have in view; and lo! before me and around me, on all sides, a most inexplicable appearance claims my attention. This singular object, whether animal or vegetable, natural or artificial—for I am in some doubt at first—appears like an interminable mass of tiny scarlet cords, twined in an inextricable maze over and around every twig of heath or furze within my range, and knit together and matted over the tops of the plants, running from one to another in every direction, and both on the lower and the upper shoots. I examine it more closely, and see that it is evidently a vegetable production, and that the red cord-like material is as evidently the stem of a plant, and not, as I at first almost believed, the web of some sort of spider (though the thickness of the cord would, on examination, have refuted such an idea, it being in the stoutest parts as large as a coarse silk thread, though towards the points scarcely thicker than a hair.) I search for leaves, but there are none—a few stunted scales being the only substitute; then for the root, but here I am sorely puzzled, for I cannot trace any of the shoots to the earth; blossoms there are in abundance—the little white knobs which break the lines of the thread in ten thousand places consisting of clusters of little flowers, which I find, on examining them under a microscope,

are very elegant, composed of five stamens and two pistils, with one four or five-cleft petal of a pale-whitish flesh-colour. The whole has a waxy look, and forcibly reminds me of the beautiful greenhouse-creeper *Hoya carnosa*. Its characteristic marks confirm my hope that it is the lesser dodder (*Cuscuta epithymum*), a plant which I had not before seen, although it not unfrequently occurs on heath and thyme in exposed situations both in England and Scotland. The dodder is of the natural order *convolvulaceæ*, and is parasitic on heath, furze, and thyme. I call it parasitic, because though springing, I believe, originally from earth, after it has thrown up its shoots sufficiently to lay hold on the plants above, it abandons its hold on the ground, and lives independently of its original root on the juices derived from the plants to which it has attached itself; absorbing them through small tubercles or papillæ, which act as roots, and which start from every part of the stem which remains long in contact with the adopting plant, into the bark of which they penetrate. Lindley gives the following lively description of it:—'Have you never remarked on the stems of the heaths, on nettles, or of the furze, clusters of stout reddish cords, which are so twisted and intertwined that you would take them for a knot of young snakes, if the colour first, and then their touch, did not undeceive you? If ever you have remarked so strange an appearance you have seen dodder, which, originally earthborn, soon lays hold of some neighbouring plant, twists her leafless shoots around it, fixes them firmly to the branches, quits her hold of the soil, and thenceforward, as if ashamed of her humble origin, feeds only upon dews and rains till the frost comes, nips her tender frame, and leaves her dead and shrivelled form still clinging to its place, a monument of the punishment of vegetable ambition.'

There is but one other species of dodder in England—*Cuscuta Europea*, the greater dodder—which is parasitic on nettles, flax, &c. Griffith speaks of 'a gigantic species in Afghanistan, which even preys on itself, one mass of which half-covered a willow of from twenty to thirty feet high.' A fit emblem this of the morbid self-tormentor who wounds himself, and sucks, as it were, his own life-blood by means of the convulsion of his own rootless fancies. In tropical countries orchideous and other parasites abound, but in England we have few which can properly be so called. The mistletoe (*Viscum alba*), that plant of Druidical celebrity, is one. In Somersetshire, and in many other counties, the apple-trees are loaded with huge bunches of this very curious plant; but in Devonshire it is not to be found growing, though, from the rapidity and cheapness of conveyance, it is commonly imported at Christmas, and Devonshire people are no longer deprived of its presence among the forests of holly which decorate every house at that mystic season. The mistletoe is a curious and interesting shrubby plant, of the natural order *Loranthaceæ*. Its stems, of a peculiar green, are repeatedly forked and jointed; its leaves grow in pairs, are lance-shaped and rounded at the point, the texture being thick and succulent, and becoming leathery as the juices of the plant dry up; the flowers are small and unnoticeable, of a yellowish-green, in terminal heads; and it is only the white semi-transparent berry, almost like white cornelian, which is in perfection at mid-winter, that gives it interest. This berry is globular, smooth, and filled with a sort of slimy substance, in which is contained a single seed. It is supposed that these seeds are carried by birds from tree to tree. Griffiths states, that 'in this tribe the ripe seeds adhere firmly to the substance to which they are applied by means of their viscid coating, which hardens into a transparent glue. In two or three days after application the radicle curves towards the support, and as soon as it reaches it, becomes enlarged and flattened; by degrees a union is formed between the woody system

of the parasite and the stock, after which the former lies entirely on the latter, the fibres of the succour-like root of the parasite expanding on the wood of the support 'in the form of a *pâte d'oe*.' Prior to that time the parasite had been nourished by its own albumen, which is gradually absorbed. I have seen bunches of mistletoe full twenty feet in girth. Birdlime is made from the bark and root of this shrub.

But I must not quit this subject without a word about the old mystic rites with which the name of mistletoe is associated. Although in great request as an adornment for servants' halls and farmhouse kitchens, this evergreen is not admitted into churches, being excluded as a relic of the old pagan customs of the Druids; at least so says Brand, and I certainly have myself never seen it used in sacred edifices. Brand quotes from an old author, who says that Yule-tide was the most respectable festival of our Druids, and that they at that season 'laid branches of the mistletoe, called also "all-heal," on their altars, as an emblem of the salutiferous advent of the Messiah: this custom is still prevalent in the north, and was lately at York.' Brand so writes not much more than a century ago: 'On the eve of Christmas-day they carry mistletoe to the high altar of the cathedral, and proclaim a public and universal pardon and freedom to all sorts of inferior and even wicked people at the gates of the city towards the four quarters of heaven.' In former years a branch of mistletoe was hung up in most houses, I believe, among the gentry, as well as among the rustic population; and it was the privilege of all in the company to kiss each individual whom they could catch under it; but in the present day, when such unrestrained licence does not prevail, it is only to be found thus exalted in the more remote and secluded corners of England, where it still holds its seigneurial rights, and produces much noisy romping and merriment among the farmhouse servants. A pretty scene often occurs when it is suspended over a family group of children, whose merry gambols are greatly enhanced by its presence—the chubby urchins, boys and girls, jumping about and kissing each other with rosy lips and soft, dimpled arms twined round each other's necks, one fair little girl dragging her fat baby brother in her arms to be 'kissed under the mistletoe,' whilst another forces grandpapa to the same charmed spot, to undergo the same ceremony; and another fine, bold, curly-headed urchin of seven or eight years old shouts with uproarious delight at having caught some little blue-eyed Annie, or tiny Jeannette, or saucy Helen, at unawares, and seized the kiss which the little damsel, aping her elders, did not mean to have bestowed! In one instance I knew a little girl of some four or five years old secrete a sprig of mistletoe under her pinafore, which, when she was taken to visit a little brother, born but the night before, and seated on her mother's bed to look at him, she suddenly drew out, exclaiming with great exultation: 'Bess his itta face, petty itta fellow, muss kiss him under the mistletoe;' which, with all due solemnity, she proceeded to do.

Where the mistletoe-bough is intended to be hung up in state, no small twigs are allowed to be placed among the decorations of the hall or kitchen, for fear of interfering with the sport, by drawing off attention from the grand point of interest. The broom-rape (*Orobanch*), a plant of a peculiar appearance, is another of the tribe of parasites—one species growing on the roots of clover, furze, and broom; another on those of the *galium*; whilst a third (*O. ramosa*) is confined to those of the hemp: of this species Vaucher of Geneva states, that 'its seeds will lie many years inert in the soil, unless they come in contact with the roots of hemp, the plant on which that species grows parasitically, when they immediately sprout.' This plant might, by a common observer, be taken for one of the orchis tribe; but it is not so—it and its congener, the greater toothwort (*Lathræa squamaria*), forming a

class of themselves without other allies. The species of the broom-rape differ much from each other. It is named from *orobus*, a vetch, and *anchein*, to strangle, because its parasitic habits are frequently the cause of the destruction of the plant whereon it grows. The corolla is tubular and lipped: the whole plant, when it first bursts forth from the earth, is of a yellowish hue tinged with purple; it then becomes of a dingy purplish-red, turning as it matures to a browner hue, and looking so livid, and so like a *dead* plant, that none, till they closely examine it, would believe that it was in the prime of life and vigour. This appearance is common to most of the species; but they vary in some degree both in hue and form, as well as in size—the largest being from 1 to 1½ feet in height, whilst others do not exceed 4 or 5 inches. It is a strange-looking plant, and one which one might well suspect of underhand and murderous proceedings, scarcely doubting that it was quite capable of strangling the young offspring of the clover in their earthy cradles, or of sucking their life-blood if they were strong enough to escape strangulation! Schlauchter says that the seeds of this tribe only attack seedlings, and are unable to attach themselves to plants of larger growth. *O. major* is a powerful astringent.

But I must no longer dwell on the subject of parasites, although the bird's nest (*Monotopa Ilyptopyis*) and many others should be noticed; for the heaths wait for a word of praise, and well they deserve it. A fine stretch of undulating heathy-ground is a beautiful object, as far as the eye can reach, and bounded only by the blue sea, lies the golden gorse (*Ulex Europæus*), interspersed with the purple glow of the heather and wild-thyme, and here and there varied by a patch of the singular reddish-brown which marks the position of a bog. The air is alive with the hum of bees which have flown miles, perhaps, to procure the honey from the aromatic thyme—and honey drawn from the heathy hillside is even purer and more delicious than that which is procured from any other source. And then there is the cry of the landrail, and the hoarse croak of the rook filling up the harmony made by a thousand free and happy birds, whilst now and then a hare or rabbit scuds across your path, or a covey of partridges rises before you with a *whirr* like the rush of an ascending sky-rocket. But few varieties of heath grow in England—five species of true heath (*Erica*) and one of ling (*Calluna*) completing the catalogue. The common sort which colours our hillside with its deep purple bells is *Erica cinerea*, the badge of the Clan Macalister: this and the ling (*Calluna vulgaris*) are alike abundant and useful, being employed for making brooms, for thatching, and often for ropes. The grouse feed almost exclusively on them, and some part of them is used for dyeing yellow. The cross-leaved heath (*E. tetralix*) grows on this hill, and is surpassingly elegant. It is from six to twelve inches in height, with fringed leaves, four together, bristly and downy; its flowers are in dense terminal clusters of a bright rose-colour, and sometimes white: it is the badge of the Clan Macdonald. We do not find either of the other British species here—the Cornish heath (*E. vagans*) and the fringed heath (*E. ciliaris*) being both confined to Cornwall, whilst *E. mediterranea* is said to be found only on the Connemara Mountains in Ireland. The heath form belongs more particularly to the Old World, those exquisitely beautiful exotic specimens which adorn our greenhouses coming principally from the Cape of Good Hope and the northern shores of the Mediterranean. Humboldt speaks of Italy and Spain, and the Peak of Teneriffe, as localities where he has seen heaths in the greatest luxuriance and beauty. It has puzzled botanists to discover the reason of the fact that the *Calluna vulgaris* suddenly disappears on the eastern declivity of the Ural Mountains, and is not again found to the east, though it abounds to the west of those moun-

tains; and it is also remarkable that this plant, though found in the Azores and in Iceland, is wholly wanting throughout all the continent of America, in which, though possessed of such a noble and extensive Flora, only one individual of the heath family has as yet been found. I shall hope at a future time to enter further on hillside topics: I must now forbear, for the setting sun and rising fog warn me to seek my home before the evening is too far advanced; therefore, with fine specimens of dodder, &c. for my *hortus siccus* in my case, I set forward, hoping that to-morrow will lead me to 'fresh fields and pastures new.'

INCIDENT DURING THE MUTINY OF 1797.

THE nineteenth century may now be said to have attained middle age, and in the brilliant noonday of its intellect and science the important events that marked the close of its predecessor are becoming dim and indistinct, like the vanishing images of a dissolving view. Progress has been so rapid since the peace that a wider chasm intervenes between 1799 and 1851 than any dividing the preceding centuries: much more than half a century appears to separate us from the eighteenth. But a stirring and a troublous period lies before this interval. Life, doubtless, was more rife with interest and excitement to those whose youth belonged to it than it is in this calmer age. One feels that the 'old people' of to-day have more of a 'history in their lives' than our age will have; and even while we acknowledge with devout gratitude the blessing of peace, it is pleasant to listen to stories of 'the War-time.' One evening, whilst sitting with a relative of our own gazing on the waters of the Channel, which were trembling and quivering beneath the rosy sunset, we expressed some such sentiments, and after agreeing in our opinion that life in those days was more animated by hope and fear than at present, he added, smiling: 'For instance, in '97 I narrowly escaped hanging!'

We were much surprised at such a declaration from one who, at the time he spoke, was a brave and distinguished admiral, and eagerly asked the 'how and why' of the adventure; and he told us. We regret that we cannot recall the exact words of the animated relation, but we will try to give the substance as nearly as possible.

In 1797 mutiny broke out among the seamen at Spithead—an inexcusable crime in the opinion of naval men, but which he who related the story palliated in some degree by candidly acknowledging that in those days the poor fellows who were guilty of it had great and just cause for complaint. They were not only ill-paid, but their food was of very bad quality; many captains in the navy were harsh and tyrannical—as, in consequence of the perversity of human nature, will probably always be the case; and the men whose blood was freely poured out in the defence of their native land were, to say the least, neglected and uncared for by their rulers. Oh happy consequence of peace and advancing knowledge! these men are now well-fed, have the means of instruction afforded them, and homes provided for them when, returning from 'the dangers of the sea,' they are discharged and sent on shore. The poor mutineers at Spithead dreamed not of such advantages as these.

Admiral R— was a junior lieutenant on board the *Saturn* when the mutiny broke out; but promotion was very rapid then, and though bearing that rank he was still only a youth in his teens. Probably the mutineers had discovered, and in a measure appreciated the kindness of his nature, for, exempting him from the thralldom of his companions, whom they had confined in the ward-room, they fixed on him to bear their propositions and their threats to the port-admiral—swearing at the same time that if he did not bring them back a favourable

answer they would hang him on the yard-arm! He was obliged to obey their will of course, secretly resolving, however, not to give them the opportunity of fulfilling their kind intentions by returning to the ship; but the young officer calculated too much upon being his own master. He was put on shore at the Point, and proceeded at once to the admiral's house in the High Street. The naval chief gave him a good-natured and cordial reception, and listened patiently to the message he delivered from the mutineers, which was to the effect that they must have an immediate advance of wages, good biscuit, pork, &c. or that they would carry their ship over to the French.

'Go on board again, sir,' was his reply, 'and tell these gentlemen that none of their demands can be listened to till they return to their duty: inform them also that the moment they attempt to weigh anchor hot shot will be fired on them from the Isle of Dogs, and their vessel and themselves sent to the bottom.'

The lieutenant bowed and left the office. Outside he paused. He was going, in obedience to his superior, to certain death. It was a fearful trial of courage and professional discipline. A mother whom he idolised lived at no great distance: he would at least bid her a last farewell! But the admiral, aware of the sacrifice he exacted, so much greater than that of perilling life by mounting 'the deadly breach,' had followed the poor boy, and lightly tapping his shoulder, told him he would walk with him to the beach. Thus even the last look at home for which he longed was denied him. A waterman's wherry reconveyed him to the ship. It was May—a bright glorious May, such as England used to enjoy 'once upon a time;' and very sad were the feelings with which the young officer looked back upon the retreating town, and round on the glad sunny waters and blue-tinted Isle of Wight, deeming that he beheld them for the last time. Occasionally also, he told us, his eyes would revert, in spite of his endeavours to forget it, to the fatal yard-arm, distinct with all its tracery of cordage against the clear blue sky. He gained the ship, was received on board, and conducted to the fore-castle, where the chief mutineers had assembled. Here he delivered his message. They were greatly enraged, and commanded him not to repeat the admiral's threat of sinking the ship to the crew. He replied simply that it was his duty to obey the orders of his superior officer. Their looks and words threatened him at first with instant and summary vengeance; but after a short consultation they agreed to try him by a court-martial, and proceeding aft, ordered him to be brought before them. It was a fearful scene; the men were terribly excited, frightfully ignorant, and believed that their cause required a victim.

The courage of the youth bore him through the trial, however, bravely. He ventured boldly to reproach them with their guilt in confounding the innocent with those whom they looked upon as their enemies; taunted them with the cowardly injustice of the deed they contemplated; and persisted, in opposition to the ring-leaders' commands, in repeating the admiral's message to the crew. He was heard by the officers in the ward-room, and their loud cheers when he spoke probably gave him fresh courage. The ring-leaders becoming alarmed at the effect his words and bearing might have on the British instincts of the ship's company, condemned him to be hung in two hours' time, and ordered him to prepare for death meantime in his cabin. There a new and singular scene awaited him: one of the seamen had taken possession of it, opened his lockers, and finding some brandy, had been drinking till he was perfectly intoxicated, and lay in the sleep of drunkenness on the floor, which was strewn and littered with the lieutenant's clothes, books, &c. A deep oath escaped the lips of the ring-leaders at this sight. Throughout the fleet the mutineers had forbidden drunkenness on pain of death; for, fully aware of the

peril of their position, they kept up among themselves a terribly severe discipline. They were raising their insensible comrade in their arms, and coolly preparing to throw him overboard, when, aware from their words of their intentions, the condemned officer struck one of them to the floor, and standing over the again prostrate drunkard, declared that while he lived he would not see men who had sailed beneath the British flag guilty of murder! The mutineers paused, touched probably by this generous defence of a foe—for the insensible seaman had been peculiarly bitter against the officers—and after a muttered oath or two they left the cabin.

The lieutenant remained alone with his disgusting and unwelcome visitant, and the two hours following he described as the most painful of his life. It was less the fear of death than the destined mode of it which tortured him: not that he was insensible or indifferent to the blessing of life, for he was by nature of a happy, joyous temperament, and fair prospects of advancement were before him; but in 'war-time' existence was held on such a precarious tenure that the idea of death in battle would scarcely have troubled his equanimity. Two hours waiting to be hanged, however, is a far different trial for courage, and we have never read or imagined anything more painful than the description which the aged admiral gave us of that (to him) endless period of time. As if to add to the horror of his position, the silence on board was so great that it appeared as if he could hear the pulsation of his own heart, while the low snoring of the drunken man struck with painful distinctness on his ear. At last the bell struck the fatal hour, and steps were heard on the ladder. His door opened; he rose prepared to shew no symptoms of faltering courage, when the leaders of the party advancing, told him 'that the people had taken his case into consideration, and as they believed he individually had no ill-feeling towards them, and as he had recently given proof that he cared for the men, they had changed his sentence from death to flogging! He must therefore prepare to receive three dozen on the following morning.'

My kinsman, with the ready humour that never deserted him, returned thanks with mock gravity for their clemency, and begged them to carry his compliments to the gentlemen who sent them, and assure them that he could not have believed he should ever have felt so much satisfaction at the prospect of a whipping. The men, always susceptible of fun, laughed. From that moment he was safe! Falstaff wisely despairs of gaining the love of Prince John, 'because he could not make him laugh'; the young lieutenant acted as if he possessed Shakspeare's knowledge of human nature when he awoke by his jest the slumbering sympathies of the sailors. He was detained a prisoner, but no further notice was taken of the threatened flogging.

The mutiny subsided on the 16th of May, when parliament passed an act to raise the seamen's wages, and the royal pardon was bestowed on the mutineers; not, however, before some sacrifice of human life had ensued, as Admiral Colpoys, on the recommencement of the mutiny on board the *London*, had ordered the marines to fire on the people, and three seamen fell. The funeral of these unfortunates was described to us as a singularly-impressive and touching spectacle. The townspeople were fearful of some violence or riot on the part of the sailors when they landed to bury their dead, and consequently closed their shutters and retired into their houses. The mournful procession moved therefore through deserted and silent streets on its way to the village churchyard, in which the victims were to be interred. But there was no cause for alarm. The men walked silently and solemnly, two and two, after their slain comrades, a stern, quiet sorrow, legible on their weather-beaten faces; and nothing could

exceed the reverence and propriety of their conduct beside the grave. It is a quiet, pretty village churchyard in which these most pardonable rebels have their resting-place, not far from which is the large grave where three hundred bodies of those who perished in the *Royal George* are buried.

One can scarcely forbear wondering at the little real mischief which proceeded from this alarming mutiny. It afforded, on the whole, a noble display of the principal characteristics of the British seaman—the frolic-spirit peculiar to him manifesting itself even when he is most sadly and seriously in earnest. A captain of marines, who was especially the object of the mutineers' aversion, was brought on shore by them, and compelled to parade up the High Street to the 'Rogue's March,' which was drummed before him. He was a tall, gaunt old man, with a singularly long neck. The day after his expulsion from his ship, the crew sent a man to his house with a message, ordering him to 'come on board again and be hanged!' The unpopular veteran sent back his compliments; but considering his throat unbecomingly long *naturally*, he did not wish to have it stretched: he declined, therefore, accepting their invitation. The men went away laughing. The people and the times were both extraordinary!

HATCHING FISH BY ARTIFICIAL MEANS.

Among the Chinese, who are not so indifferent about their fisheries as Englishmen appear to be, a curious method of hatching fish by artificial means is very extensively practised. 'The sale of spawn for this purpose,' says Mr Martin, 'forms an important branch of trade in China. The fishermen collect with care, on the margin and surface of water, all the gelatinous matters that contain spawn of fish, which is then placed in an eggshell which has been fresh emptied, through a small hole, which is then stopped, and the shell is placed under a sitting fowl. In a few days the Chinese break the shell in warm water (warmed by the sun.) The young fish are then kept in water until they are large enough to be placed in a pond. This plan in some measure counteracts the great destruction of spawn by troll-nets, which have caused the extinction of many fisheries.'—*United Counties Miscellany*. [Sir Francis Mackenzie of Gairloch has succeeded, by some process not yet made public, in assembling a shoal of young salmon fry hatched in a pond during spring, and ready, at the proper age, to be turned into their ancestral river—the Ewe.]

CURIOUS SCENE AT SEA.

While a passenger from Aden to Bombay on board the East India Company's steamer *Queen*, in December last, it was our lot to fall short of coals; having had contrary winds and a heavy sea nearly the whole distance, our trip was prolonged to fourteen days, usually performed in eight. The vessel had coaled in Aden only for ten days' steam, and luckily she had besides a considerable quantity of small coal or dross; but still it was found that it would be absolutely necessary to burn part of the ship's stores to bring her into harbour. Orders were accordingly given to that effect, and it was with a kind of terror mingled with surprise that we saw, one after another, the long-boat, spare spars, junk soaked in ghee and oil (to facilitate its burning), the engine hatches, and the top-masts, cut up and burned. Then came the turn of the orlop deck, which was torn up from beneath our feet and stuffed into the insatiable maw of the furnace; then went the gun-slides, and then a number of packages of government powder barrel heads and staves; and at length rumours were rife among the seamen that their sea-chests were to share the same fate. It would be difficult to describe the feelings of the passengers, more especially of the ladies, when looking on at the ship thus being torn to pieces before their eyes, and when listening throughout two sleepless nights to the noise of sawing, and chopping, and throwing. It would be equally

difficult to describe the relief with which, on the fourteenth morning, they beheld through the telescope, by the light of the rising sun, a faint outline of the island of Bombay, the harbour of which we duly reached. In explanation of this extraordinary scene, I may mention that the instructions of government insist peremptorily upon the commanders of mail-steamers, in the event of the fuel running short, burning anything and everything that will assist in bringing the vessel to her destination.—*Extract from a private Letter from Bombay, dated 14th May last.*

BENEDETTA MINELLI.*

I.

THE NUN.

It is near morning. Ere the next night fall
I shall be made a bride—Heaven's bride. Then home
To my still marriage-chamber I shall come,
And spouseless, childless, watch the slow years crawl.

These lips will never meet a softer touch
Than the cold crucifix I kiss: no child
Will clasp this neck. Oh, Virgin-Mother mild,
Thy painted blies will mock me overmuch!

This is the last time I shall twist the hair
My mother's hand wreathed, till in dust it lay:
The name—her name, given on my christening-day,
This is the last time I shall ever bear.

Oh weary world—Oh heavy life, farewell!
Like a tired child that creeps into the dark
To sob itself asleep where none can mark,
So creep I to my silent convent-cell.

Friends, lovers whom I loved not, kindly hearts,
Who grieve that I should enter this calm door,
Grieve not! since closing softly evermore,
Me from all sorrows, as all joys, it parts.

Love, whom alone I loved! who stand'st far off
Lifting compassionate eyes that could not save,
Remember, this my spirit's serenest grave
Hides me from worldly pity, worldly scoff.

'Twas not thy hand but Heaven's that came between,
And dashed my cup down. See, I have no tears;
And if I think at all of vanished years,
'Tis but to bless thee for what joy has been.

My soul continually does cry to thee:
—In the night-watches—ghostlike—stealing out
From its flesh-tomb and wandering there about—
'So live, that I in heaven thy face may see!'

Live, noble heart; of whom this heart of mine
Was all unworthy. Build up actions great,
That I, down-looking from heaven's crystal gate,
Smile o'er my dead hopes hid in such a shrine.

Live! keeping aye thy spirit undefiled;
That when we stand before our Master's feet,
I with an angel's love may crown complete
The woman's faith, the worship of the child.

Then thou shalt see no sorrow in these eyes;
And even their love, by God's great love subdued,
Shall never grieve thee with a pang too rude:
The incense-clouds have veiled the sacrifice.

Dawn, solemn bridal-morn! Ope bridal door!
I enter. My vowed soul may Heaven now take!
My heart, its virgin-spousal for thy sake,
Oh love! keeps sacred thus for evermore.

* A noble Florentine lady, whose family belonged to the political faction of the Guelphs, while her betrothed joined the opposite side of the Ghibellines. They were forced to renounce each other: she went into the convent of San Chiara, but afterwards, during a pestilence, became a Sister of Mercy—dying very aged, and in great sanctity.

II.

THE SISTER OF MERCY.

Is it then so? Kind friends who sit and sigh
While I lie smiling—is my life's sand run?
Will my next matins, hymned beyond the sun,
Mingle with those of saints and martyrs high!

Shall I, with these my gray hairs changed to gold,
These aged limbs enrobed in garments white,
Stand all transfigured in the angels' sight,
Hymning triumphantly that moan of old—

'Thy will be done.'—It was done. Oh my God,
Thou know'st, when over grief's tempestuous sea,
My broken-winged soul fled home to Thee,
I writhed, but murmured not beneath Thy rod.

It fell upon me, stern at first, then soft
As parents' kisses, till the wound was healed,
And I went forth a labourer in Thy field—
They best can bind who have been bruised oft.

God, Thou wert pitiful! I came, heart-sore,
To drink Thy cup, because earth's cup ran dry;
Thou slew'st me not for that impiety,
But mad'st Thy cup so sweet, I thirst no more.

I came for silence, dark, dull rest, or death:
Thou gavest instead life, peace, and holy toil:
My sighing lips from sin Thou didst assail,
And fill with righteous thankfulness each breath.

Therefore I praise Thee, that Thou shut'st Thine ears
Unto my misery: did'st Thy will, not mine:
That through this length of days Thy hand divine
My feet from falling kept—mine eyes from tears.

Sisters, draw near! Hear my last words serene:
When I was young I walked in mine own ways,
Worshipped—not God; sought not alone His praise:
So He cut down my gourd while it was green.

And then He o'er me threw His holy shade,
That, though no other earthly plants might grow,
Mocking the glory which was laid so low,
I dwell in peace, and what He willed, obeyed.

I thank Him for that joy, and for its pain:
For healed pangs, for years of calm content:
For blessedness of spending and being spent
In His high service where all loss is gain.

I thank Him for my life and for my death;
But most, that in my death my life is crowned,
Since I see there, with angels gathering round,
My Angel!—Ay, love, thou hast kept thy faith—

I mine. The golden portals will not close
Like those of earth, between us. Reach thy hand!
—No 'Miserere,' sisters! Chant out grand
'Te Deum laudamus!'—Now—'tis all repose!

ECONOMY IN CANDLES.

If you are without a rushlight, and would burn a candle all night, unless you use the following precaution it is ten to one an ordinary candle will gutter away in an hour or two, sometimes to the endangering the safety of the house. This may be avoided by placing as much common salt, finely powdered, as will reach from the tallow to the bottom of the black part of the wick of a partly-burnt candle, when, if the same be lit, it will burn very slowly, yielding a sufficient light for a bed-chamber: the salt will gradually sink as the tallow is consumed, the melted tallow being drawn through the salt, and consumed in the wick.—*The Economist.*

PRICE 1½d.

POSITION OF WOMEN.

THERE is a strange, muddling, under-current of opinion, which occasionally gurgles up to the surface, and appears before respectable company, to the effect that women are not done justice to by men; in so far as they are not allowed the same political privileges, and are excluded from several professions. The movement has hitherto been most conspicuous in America, where there have been one or two conventions of females for the purpose of issuing declarations, and taking other measures for the purpose of obtaining the rights assumed to be withheld by the opposite sex. Even in this country, where there is usually a soberer feeling towards novel views, there are some writers who seriously avow their belief that it is right and fitting for women to intermingle in politics, and to contribute their votes along with men at all elections, and who can foresee no impropriety whatever in inviting women into every profession for which they may conceive themselves to be fitted. It will readily occur to most people, as a serious difficulty in the way of granting them common electoral rights, that in nearly every part of our empire they would in that case outvote the sterner sex, there happening to be 800,000 more women in the island of Great Britain than men. We refer, however, to this merely as a jest, for the other objections are so overwhelming as to require no such aid to make them hold with the rational part of society.

It is either blindly overlooked or perversely ignored by the arguers for women's rights, that nature has, in the very first place, given women a different physiological constitution, and therefore a different social destiny from men. There never could be any true political equality between the sexes; and even their legal rights can scarcely be equal, simply because they are naturally unequal. It might be more polite to say they are different; but we shall still prefer the honest, downright course of saying they are unequal.

A late writer on the side of the Women's Rights' Movement was content to do no more on this point than to quote a passage from the writings of Sydney Smith: 'A great deal has been said of the original difference of capacity between men and women, as if women were more quick and men were more judicious—as if women were more remarkable for delicacy of sensation, and men for stronger powers of attention. All this, we confess, appears to us very fanciful. That there is a difference in the understandings of the men and the women we every day meet with, everybody, we suppose, must perceive; but there is none, surely, which may not be accounted for by the difference of circumstances in which they have been placed, without

referring to any conjectural difference of original conformation of mind. As long as boys and girls run about in the dirt and trundle hoops together, they are both perfectly alike. If you catch up one-half of these creatures, and train them in a particular set of actions and opinions, and the other half to a perfectly opposite set, of course their understandings will differ, as one or the other sort of occupations has called this or that talent into action. There is surely no occasion to go into any deeper or more abstruse reasoning in order to explain so very simple a phenomenon.'

Now, in the first place, we never could be content to rest so great a question as this upon the opinion of Sydney Smith or any other man, as to the mere mental organisation of the sexes. In the second, we deny that the opinion of the reverend canon of St Paul's is right. We appeal to every father of a family who has had both sons and daughters, and to every teacher who has had both boys and girls in his charge, if he did not observe a substantial difference in the mental organisation of the sexes. We have put the question to hundreds, and never did we fail to get for answer that boys are from the earliest period of infancy different from girls, and require a different kind of management. In truth, it is so notorious a fact among those who judge from experience, that we cannot look but with a kind of pity on a writer avowing an opinion so heterodox to the simplest principles of mental science. It is indeed true that the human mind is the same thing in the two sexes; and it is not less true that there is more intellectual power in some women than in some men. How a Mrs Somerville, for instance, downweighs a whole load of common men! But these particulars are nothing to the purpose. We must take women in general against men in general; and we must consider not merely the amount of intellectual acuteness or force which may be in the two sexes respectively, but the entire female character against the entire masculine character.

What is so striking to those who have really entitled themselves by observation to speak on this subject is, that while the girl may learn her lessons as fast as her brother, and speak on most subjects as much to the purpose, she is in her entire character a softer and weaker being. The boy is rough, difficult to control, adventurous, self-dependent, obdurate—this as a rule: of course there are exceptions. The girl is at the same time found gentle, docile, timorous, submissive: this also as a rule, fully admitting that it fails in particular instances. We have heard numberless parents of families declare that they could more easily manage six girls than two boys. In attributing the difference usually observable to the boys and girls being trained

to a particular set of actions and opinions, Sydney Smith has only pronounced himself, to our apprehension, as ignorant of the whole matter. The idea deserves only to be ranked with that of certain philosophers who have gravely argued—we believe it has been argued several times from the days of Plato downwards—that there is no native difference of talent or disposition in men, and that all the differences seen in their mature days are the effect of education. From how many foolish philosophical fancies would a little actual observation free us!

We cannot stop to adduce proofs in support of our view; but we have no doubt that the great mass of sensible and reflecting men will support us in assuming that it is on the whole correct. If it be so, it takes all plausibility away from the claim put forward for women, that they ought to be excluded from no privilege which is enjoyed, and no profession which is open to the opposite sex. Public life and all its concerns require those qualities of resolution and reflection in which women are in general deficient. If intrusted with votes, they would, in ninety-nine out of a hundred instances, use them at the command or entreaty of some male connection; so that no fresh independent opinion would be infused into the election. True we accept a female as a sovereign; but so also should we in that situation support a moderately-endowed man. In that case the genealogical idea constitutes the quality required: we do not look for personal qualities beyond a medium share of the ordinary human faculties. As to the professions, we might at once bring the claim to the *reductio ad absurdum*, by asking if the army ought to be composed of equal parts of women and men. But we proceed to wider ground, and say that the general sense of fitness and expediency has hitherto determined, and will continue to determine the point. A woman obviously cannot be a soldier or a sailor. There are many occupations which she cannot cope with from want of physical strength. There are others, both high and low—as an example of the former we might adduce the law—which women might undertake, if mere intellectual acuteness and diligence were the sole requisites; but it often happens that in such professions there is a necessity for personal vigour and combativeness such as can only be regularly looked for among the harder sex; in others a certain rudeness of circumstances is unavoidable, and from this it is most desirable that women should be exempt. We here lay no stress whatever upon the liability of women to be diverted or withheld from any duties they undertake by those connected with maternity, for we regard that difficulty as one of an occasional character which might to a great extent be overcome. But we cannot but attach consequence to those objections which refer to the preservation of feminine delicacy. It is entirely a question of comparative advantages.

On the one hand, it must be admitted that the enforced idleness in which a great number of women belonging to the middle classes are kept, by reason of the scruples which forbid their entering into any kind of business which brings them in contact with the public, is an evil under the sun, and one which is attended by many bad effects. On the other hand, the lady who is confined to the retirement of elegant domestic life possesses a charm which most people would think poorly exchanged for the fruits of any professional activity she could exert, attended as these would necessarily be by more or less damage to that fine moral enamel which is so highly appreciated. Here we think there is some room for debate. It may be fairly questioned whether the refinement of the retired lady is not bought at too high a price—whether the evils apprehended from a freer intercourse with the world are not less than those which actually arise from the vacancy of thought resulting from a harem-like seclusion. We, for our own part, are most ready to

deplore the unnatural vacuity in which women are left, and the hardships to which they are often exposed from the difficulty of procuring a means of independent subsistence without a sacrifice of their position in society. But we believe that these are evils which the progress of society, and nothing else, will cure. Humanity and refinement are extending every day through the mass of the people. Generous, forbearing, and protective feelings towards women must, in the course of things, supersede much of the reckless levity and the unworthy sensuality with which the softer sex are now regarded. An improved *morale* will enable women to venture into spheres of exertion which they cannot now safely approach. In the meantime, if women are injured by the public opinion which prevents them from entering upon various occupations, we must lay the evil to the charge of the public morality and civilisation, which is not yet competent entirely to protect them.

The advocates of what are called Women's Rights make a loud complaint of the subordinate state in which women are kept by men, as if they were the victims of some monstrous tyranny, and never exercised any influence as women. This seems to us truly absurd when we recollect the equality of consideration, the deference, and the protecting tenderness shewn to women almost everywhere throughout society. It is a suspicious fact against the views of the new party, that the women themselves do not as a class grumble at their situation—unless we look upon the attempt now making in America at a change of costume as the beginning of a general revolution. It must be considered, however, that the appropriation by the transatlantic ladies of that mystical garment usually monopolised by men is not so much an invasion of the rights of the male sex as an expression of their discontent at the inconvenience suffered by their own. There can be no good reason why our drawing-rooms should continue to the end of the chapter to be filled with Mother Bunches, or why our streets should be swept perpetually with muslin or satin besoms; and for this reason we think it no abandonment of our theory to suppose, and to hope, that the movement alluded to may end in some modification of the female dress. But in other matters tasteful women are by no means the malcontents they might be supposed from agitation of a less reasonable kind. The fact is, they are generally sensible that their proper position is one which allows of man standing forward to bear the shock and struggle of the world. They feel that it is their proper part, not to make and support a home, but to adorn it when it has been made by a being more fitted by nature for that duty. There are some points, we believe, in their legal position which might bear amendment; but on the whole their condition, when they observe moral rules, is not a severe one, and they may take further comfort from the consideration that it will continually improve.

F A D L A L L A H.

PEOPLE who have been employed in official situations under absolute and irresponsible princes, though from old habit not very communicative, sometimes, in their moments of expansion, as the French phrase it, indulge in strange revelations of the secret workings of authority. As a matter of course their sympathies are engaged for the most part on the side of power; and it is curious to observe the exclusion from their narratives of all moral reflections, of all positive opinions, and, above all, of that natural indignation which the contemplation of uncalled-for cruelty arouses in the majority of men. This state of mind is brought about by an attempt to satisfy their own consciences. They try to persuade themselves that they have been the instruments of a kind of human destiny, to which no more

responsibility attaches than to the motions of a steam-engine. A consciousness of some fallacy in this theory lurks of course in their mind, but it rarely betrays itself in language, though not unfrequently in an uneasy manner, and a scrutinising look at the face of the listener. The following anecdote is told in the words of one of the Frank secretaries of the celebrated Boghos Bey, chief minister of Mohammed Ali, late viceroy of Egypt.

I was sitting one day in the private office arranging some papers, and waiting the arrival of my principal, when a rapid dialogue in the outer room, the doorway of which was covered by a curtain, drew my attention. Both voices spoke in Arabic—the loudest in a tone of passionate entreaty, scarcely justified by the indifferent objections urged by the other against an invasion of the privacy of my apartment. I was in the act of clapping my hands, when the curtain was thrust hastily aside, and a person dressed in the European style entered, followed by a black slave expostulating, as in duty bound, on the intrusion. The newcomer looked surprised and annoyed at seeing me, and muttered something about its being of the greatest consequence to him to have an interview with his excellency. I begged him to be seated, and wait for half an hour; dismissed the slave; and proceeded with the arrangement of the papers. Properly speaking, I should have inquired his name and business; but so great and evident was his agitation, that I thought it best to allow him some time to recover. He threw himself on a divan, and endeavoured to appear calm, but without success. From time to time I cast a glance towards him, and gradually felt my curiosity and interest increase. He was a young man, not more than two-and-twenty years old, and of marked Oriental physiognomy. I could not, however, make out to what race he belonged—such delicate and expressive features being found in nearly equal proportions amongst Turks, Arabs, and Levantines of various classes, without being common everywhere. He was dressed rather elegantly in the Parisian style; and the more I observed him the more I was struck by the contrast between the general polish of his manner and the uneasy cowering expression that occasionally flashed across his features. It is due to my sagacity to say, that I arrived at last at the conclusion that he was an Eastern slave in the disguise of a European gentleman.

My curiosity went on increasing, and the desire to speak was becoming irresistible, when the bey entered the apartment. I shall never forget the look of perplexity and compassion that appeared in the countenance of the old minister, nor that of mingled fear and hope by which it was met. 'Fadlallah here!' at length exclaimed the bey. I was surprised at the rapidity with which I understood the whole affair in the sound of that name; and probably my settled conviction that it was a hopeless case disclosed itself in my look, for the young man, seemingly anxious to collect all opinions, bent his eyes intently upon me when he saw me start, and then, burying his face in his hands, wept like a child.

The case was this: Fadlallah was one of the young men who had been sent for education to Europe. He formed part of the Leghornese College, and I knew that various very unfavourable reports upon his conduct had been forwarded by the superintendent; and that, in fact, some time previously, it had been announced that he had not only broken the bounds but turned Christian, and claimed protection from the native authorities. This was an unpardonable offence; and for him voluntarily to throw himself into the hands of the Egyptian government appeared to me to be sheer madness. Possibly his excellency thought as I did, for after some silence he muttered, 'Poor fellow!' and then recovering his official serenity, coldly asked what was the meaning of this visit.

The meaning was evident enough. Poor Fadlallah wanted to be forgiven, to be taken again into favour, or at any rate allowed permission to join his family—wealthy people in Cairo. He spoke a long time, and said some eloquent things; but it was evident that his protracted residence in Europe had caused his views of the state of Egypt to differ considerably from the truth: and when he two or three times based his hopes of pardon on the fact which he had read in newspapers, that Mohammed Ali was now the 'father of his people,' I could see a smile, half-satirical half-contemptuous, play for an instant round the thin lips of my sagacious master. When the appeal was concluded, I began to suggest some questions; but the bey interrupted me, saying: 'There are three facts ascertained: Fadlallah has disobeyed orders, has claimed foreign protection, and has embraced Christianity—fatal, unpardonable acts; on the other hand, he has trusted in the clemency of his highness. We shall see whether that trust be well founded.'
